**088050 PROPAGATION AND BIT ERROR RATIO MEASUREMENTS FOR A MICROCELLULAR SYSTEM.** Propagation measurements are provided for highway and city center microcells. Measurements along various motorways were taken with base station (BS) antennas at 10 m elevations. Pseudo-random binary sequences (PRBS) were transmitted via non-coherent FSK at 905 MHz. Low radiated power (16 mw into an 18-element Yagi) was used, and the signal level and bit error ratio (BER) were recorded by a mobile station (MS). The microcell length was found to be a function of the received field strength and, therefore, the BER. It was found that the cell lengths varied between 1 to 2 km for a BER of  $10^{-3}$  or better. Although the PDF of the received signal was Rician the microcell length was determined using the more pessimistic Rayleigh PDF. Two and three microcell clusters were considered. An

inverse fourth power law was observed, and the received signal power in the microcell varied linearly with radiated power. For power levels of only 1  $\mu$ W, error free transmission was found to occur over a cell length of 400 m. Measurements in the Harley Street area in Central London enabled us to study how signals propagate in a nearly rectilinear grid pattern of roads. A theoretical model was established that provided signal levels that were close to those measured. (Edited author abstract) 12 refs.

**088051 IMPLEMENTATION OF AN EXPERIMENTAL MODEM FOR CELLULAR MOBILE RADIO CHANNELS.** The design, simulation, and implementation of a modem specifically for use on mobile radio channels at frequencies allocated to the existing UK cellular system is described. A novel technique for transmitting two phase-modulated digital signals from two mobile vehicles on nominally the same carrier frequency, and performing detection and separation of them at the receiver is covered. The potential application of this system in cellular mobile radio is discussed, together with an assessment of typical improvements in system capacity that might be achieved. (Edited author abstract) 14 refs.

**088052 SPATIAL DISTRIBUTION OF TRAFFIC IN A CELLULAR MOBILE DATA NETWORK.** The position of a mobile terminal influences its probability to capture the central receiver in the base station of a cellular radio system using slotted ALOHA for multiple access. Integral transforms of the probability density function for the received power prove a useful tool for analyzing the relation between the spatial distributions of offered and throughput packet traffic in a mobile radio network with Rayleigh fading channels. A newly developed method to obtain the spatial distribution of throughput traffic from a prescribed spatial distribution of offered traffic is presented and illustrated with examples. Incoherent and coherent addition of interference signals is considered. The channel behavior for heavy traffic loads is studied. In both the incoherent and coherent case, the spatial distribution of offered traffic required to ensure a prescribed spatially uniform throughput is synthesized numerically. (Edited author abstract) 44 refs.

**088054 EUROPEAN PLANS - A CRITICAL ANALYSIS.** 1987 was the year in which a pan-European standard for cellular radio was agreed that will permit hand-over and international roaming. A broad spectrum of opinion as mobilized to make this happen, culminating with a meeting of the European Heads of State in London on 6 December 1986. A compromise standard was agreed

in an effort to incorporate the best features of all the proposals. The lower risk narrowband TDMA technology, so strongly advocated by the UK was adopted, with the French approach to the signal processing and a German voice coder.

**088055 MOBILE RADIO COMES OF AGE IN THE ISDN.** The last decade has seen the introduction of the first system generation of switching systems using stored program control (SPC) technology. During the 1980s, these systems have been developed further to provide for digital speech transmission and the introduction of ISDN, which will enable speech and data to be transmitted via one standard network. This transition is now in full swing and will be given new impetus with the introduction of new services such as digital cellular radio. (Author abstract)

Rolle, Gerhard. *Telecom Rep* v 11 n 2 Mar-Apr 1988 p 44-45.

**088056 OUTAGE PROBABILITY CALCULATIONS FOR MULTIPLE COCHANNEL INTERFERERS IN CELLULAR MOBILE RADIO SYSTEMS.** The calculation of outage probability is discussed in relation to cochannel interference problems inherent in mature cellular radio systems. Outage probability equations for coverage only and for single cochannel interferer situation are reviewed, and examples of the application of these results to the estimation of the service area of a typical cellular base station are given. An analytical technique for multiple uncorrelated interferers in a Rayleigh fading environment is presented and the effect of several cochannel Rayleigh interferers on the service area of a cellular base station is examined. (Edited author abstract) 11 refs.

**088057 EFFECTS OF THE INTERFERENCES IN CELLULAR DIGITAL MOBILE RADIO SYSTEMS USING FULL RESPONSE CPM WITH LIMITER-DISCRIMINATOR DETECTION.** Spectral characteristics of signals and bit error probability of transmission systems are analytically evaluated with reference to full response CPFSK systems with rectangular modulation pulse shaping and limiter-discriminator detection, applied on a typical cellular mobile radio network. The analysis is carried out in the case of four-level signals, in the presence of transmission nonlinearities and cochannel and adjacent channel interferences. The results obtained show that the spectral compactness cannot be assumed as a good index of a bandwidth-efficient modulation system. Moreover, in some significant cases, which differ because of vehicular locations, channel spacing and modulation parameters, they indicate the signal-to-noise ratios necessary at the receiver input to guarantee a fixed bit error probability, in both the base-to-mobile and mobile-to-base transmissions. (Author abstract) 16 refs.

Andrisano, Oreste (Univ di Bologna, Bologna, Italy); Corazza, Giorgio; Immovilli, Gianni. *Alta Freq* v 57 n 2 Feb-Mar 1988 p 109-117.

**088058 ON OPTIMUM AND SUBOPTIMUM COHERENT DETECTION OF CONTINUOUS PHASE MODULATION ON A TWO-RAY MULTIPATH FADING CHANNEL.** The performance of continuous-phase-modulation (CPM) transmission on a two-ray fading channel and received in white Gaussian noise is investigated. The optimum coherent maximum-likelihood (ML) detector and approximations thereof and their performance are studied by means of minimum Euclidean distance and simulated symbol error probability. A linear detector optimum at large signal-to-noise ratios is also studied, and its performance is given in terms of error probability. It is found that the loss in signal power due to the channel is small when the ML detectors are used for binary schemes with modulation index  $h = 1/2$ . The loss

for these schemes with a linear detector becomes significantly larger, especially with MSK transmission. Its performance can be improved significantly by using decision feedback, but the performance of the ML detector is still superior. 18 refs.

Svensson, N. Arne B. (Univ of Lund, Swed). *IEEE Trans Commun* v COM-35 n 10 Oct 1987 p 1041-1049.

**088059 ADVENT OF LAND MOBILE SATELLITE SERVICE SYSTEMS.** A recent Federal Communications Commission (FCC) decision that has allocated L-band (1.5 GHz, 1.6 GHz) spectrum to land mobile satellite systems to provide mobile radio, mobile telephone, data communication, and other services. In addition to these bands there is a Ku band at 14/12 GHz that provides feeder links for destination communications control and other functions. A description of the system is given, and the various factors involved in its realization are examined. Some of the operational, systematic, and technological considerations of the first-generation land mobile satellite service that would provide thin-route services to large land masses of North America are considered. The discussion covers the ground segment, propagation effects, orbital reuse, and link considerations and user capacity. 15 refs.

Pattan, Bruno (Federal Communications Commission, USA). *IEEE Trans Aerosp Electron Syst* v AES-23 n 5 Sep 1987 p 691-703.

**088060 QUEUEING-BLOCKING SYSTEM WITH TWO ARRIVAL STREAMS AND GUARD CHANNELS.** An approach to the study of a multichannel cutoff priority system for two Poisson arrival streams with distinct arrival rates and the same potential service time distribution is proposed. This approach makes it possible to obtain the state probabilities in simple closed-form expressions. These expressions provide a straightforward way to derive the distribution of the number of busy servers, the queue length distributions, and, above all, a very simple criterion for the stability of the system. The computations can still be easily carried out for large systems (e.g., 100 servers). The method can easily be extended from the infinite-queue-length case to a system with finite capacity. As applied to cellular radio, the method offers a means of increasing the total carried traffic while improving the perceived service quality. 23 refs.

Guerin, Roch (California Inst of Technology, Pasadena, CA, USA). *IEEE Trans Commun* v 36 n 2 Feb 1988 p 153-163.

**088061 NEW CELLULAR SCHEMES FOR SPECTRAL EFFICIENCY.** Assuming the constraint of an allocated frequency spectrum, two novel schemes are presented that improve spectral efficiency by more than 50 channels/cell. The two schemes are multiple channel bandwidth systems and one-third channel offset systems. A suggestion for integrating four schemes (underlay/overlay, diversity, multiple channel bandwidth, and one-third channel offset) to achieve maximum spectral efficiency is presented. The hybrid system can offer better performance because it takes advantage of the merits and performance of each individual scheme. 5 refs.

## Computer Aided Design

**088062 DEVELOPMENT OF PROPAGATION MODELS AND CAD TOOLS FOR THE PLANNING OF MOBILE COMMUNICATION NETWORKS.** The network planning for future small cell mobile communication systems, such as that of CEPT/GSM, require much more accurate propagation prediction models than those currently available. Further the great complexity of this network makes it unavoidable that for planning Computer Aided Design (CAD) methods be used. This paper presents the approach taken and the results obtained in the research of the Dr. Neher Laboratories with respect to

propagation modeling and the development of CAD tools for network planning. The propagation work is based on extensive field-strength and pulse amplitude measurements together with a detailed topographic data base. The analysis shows the limitations of the CCIR type of prediction model. As a start towards a new model, detailed analyses were performed on the relationship between measured data and topographic quantities, e.g. building height, road size and density etc. The 1st generation CAD planning tool is presented together with the experience obtained in its development and operational use. (Author abstract). 5 Refs.

**088064 ETUDE ET REALISATION D'UN SIMULATEUR DE CANAL RADIOMOBILE A LARGE BANDE.** [Study and Implementation of a Wideband Mobile Radio Channel Simulator]. Recently, mobile/radio communications have made use of new digital modulation methods, in particular spread spectrum, in order to combat jamming and propagation multipaths and to work in multiple access. A channel simulator has shown itself very useful in order to test at low cost a 910 MHz mobile/radio transmission in a suburban site. After introducing the advantages of the direct sequence spread spectrum concept, this paper describes the mobile/radio transmission characteristics and defines the signal expression through the channel. From a thorough study of four types of simulators existing in the literature, an electrical scheme is derived, which can best reproduce a suburban transmission between a fixed transmitter and a mobile receiver. Principles and board arrangement of the simulator are presented. The measurement data obtained by the simulator have shown a good agreement with the field measurement data. (Edited author abstract). 11 Refs. In French.

## Control

**088065 SERIAL BUS CONTROLLED AUDIO-PROCESSOR.** The conventional tone and volume controls in car radios using potentiometers require a lot of discrete components. They are expensive, need a lot of space, and reduce the reliability level. A description is given of a microprocessor-controlled audioprocessor providing all functions, including source selector, volume control, bass and treble control, balance and fade, on one chip, with only a few external components. It offers high performance with especially low distortion and noise.

## Control Systems

**088066 USERS VIEW OF MOBILE RADIO DATA.** The mobile data communication system used by the British Gas East Midlands to control their vehicle fleet is described. Two types of control systems are considered: 100 bits per sec four tone system, and 300 bits per sec FSK system which has error correction and protection. Both types of control systems are identical in concept in that

they provide: mobile queuing in order of arrival; automatic acknowledgement; call set up; automatic-base station selection; vehicle status and request; selective call; emergency call; and text transmission. The use of data signalling in channel management allows the maximum use of a single radio channel, saving voice calling and contention times, which can produce a saving of 30% of usable air time.

## Design

**088067 SET-THEORETIC APPROACH TO THE DESIGN OF MOBILE RADIO COMMUNICATIONS NETWORKS.** The set-theoretic approach to designing radio communications networks on the basis of mathematical techniques introduced on monotonic sets, for definite conditions imposed on the communication matrix of the subscriber set  $W$  of the radio network, makes it possible to design a radio communications system and to minimize the number of channels employed. The proposed method can be used to divide a set of subscribers  $W$  of any communications network into groups of subscribers which are in a definite sense the most uniform and closely connected. 8 refs.

## Europe

**088070 PROSPECTS FOR SATELLITE MOBILE RADIO SERVICES FOR EUROPE IN THE 1990S.** Growing interest in the potential of satellite mobile services in offering facilities complementary to those provided by the pan-European cellular radio network has stimulated a number of in-depth studies into possible system architectures. These activities are now coming together in a coordinated European program and this paper summarizes the service opportunities which are emerging and some of the major technical issues which must be addressed in preparation for viable commercial operations. (Author abstract) 8 refs.

Gardiner, J.G. (Univ of Bradford, Bradford, Engl). *J Inst Electron Radio Eng* v 57 n 6 Nov-Dec 1987 p 241-245.

**088071 EVOLUTION OF CELLULAR MOBILE COMMUNICATIONS SYSTEMS IN EUROPE.** In Europe, public mobile radiotelephone services started in the early 60's, using the 80 MHz and 160 MHz bands, with capacities of few channels and manual operation. In the 70's some countries introduced services at 160 MHz and 450 MHz with a few dozen channels and a first generation of automatic systems were implemented mainly in the 160 MHz band. In the early 80's a second generation of automatic systems was introduced using the cellular technique in the 450 MHz band and more recently some countries extended this kind of system in the 900 MHz band. Nowadays the demand for mobile radio systems is experiencing such a rapid expansion that an incredible amount of research has been undertaken to design new advanced systems, which will be able to make land mobile communications accessible to millions of subscribers on a variety of mobile transports; a European harmonization project will ensure continuous communications to mobile users travelling throughout Western Europe. (Author abstract) 11 refs.

**Mathematical Models** See RADIO TRANSMISSION—Fading.

**Measurements** See Also RADIO TRANSMISSION—Monitoring; RADIO TRANSMISSION—Reflection.

**088073 WIDE-BAND PROPAGATION MEASUREMENTS AT 900 MHz.** Results are presented of the number of measurements performed in the time-delay domain, according to the sounding technique referred to as 'radar pulse technique', in order to characterize a wideband mobile transmission channel. Different environments were examined: urban/suburban areas (Stuttgart FRG) and mountainous regions (Aosta Valley, I). Instantaneous echo profiles were investigated: statistical elaborations are presented in terms of cumulative distributions of synoptic parameters, such as average delays, delay spreads, delay windows and intervals. Some efforts were also devoted to study the problem of the variability of the channel, taking both space and time repeated measurements, and examining the evolution of the various echoes inside an impulse response. Finally, an attempt was made to characterize the locations where repeated measurements were carried out, by 'average delay profiles', and to compare them with the typical envelopes recently proposed by COST 207. (Author abstract). 8 Refs.

Damosso, Eraldo (CSELT, Turin, Italy). *Alta Freq* v 57 n 2 Feb-Mar 1988 p 65-74.

## Performance

**088074 MEAN LEVEL RECEIVER FOR FH-MFSK MOBILE RADIO.** The performance of parametric receivers such as the linear, the maximum likelihood and the hard limiter have been analyzed before for the detection of frequency-hopped multilevel frequency-shift keyed signals (FH-MFSK) in mobile radiotelephony. Nonparametric receivers such as the minimum rank sum receiver (MRSR) and the reduced rank sum receiver (RRR) were previously

considered. A receiver called the mean level receiver is analyzed. It is neither parametric nor nonparametric. It depends on the noise (or interference) distribution except for a scale parameter which may correspond to the noise power. The proposed receiver is distinguished by its easier implementation, constant false alarm rate and relatively good performance. (Edited author abstract) 11 refs.

Al-Hussaini, Emad K. (UAE Univ, Al-Ain, United Arab Emirates). *Trans Inst Electron Inf Commun Eng Sect E (Engl)* v E70 n 10 Oct 1987 p 968-974.

**088075 PHYSICAL OPTICS ESTIMATION OF URBAN MOBILE RADIO CHANNEL DELAY-DOPPLER RESPONSES.** Multipath radio propagation effects due to buildings that are large compared to the wavelength are readily analyzed by physical ray-optics techniques. Estimates of mobile radio channel delay-doppler response functions have been obtained by this approach for a mobile unit located in a long straight street lined by high buildings. The results, represented as limiting impulse set forms, show the main characteristics, including the street orientation dependence, evident in published experimentally determined delay-doppler functions. Mean field strength levels, also derived in the analysis, likewise show good agreement with the relative street orientation dependencies reported by other workers. (Author abstract) 19 refs.

Davies, William S. (Telecom Australia, Clayton North, Aust.). *AEU Arch Elektron Uebertrag Electron Commun* v 41 n 6 Nov-Dec 1987 p 341-346.

**088076 PERFORMANCE OF ACCESS STRATEGIES FOR D-TASI OVER MOBILE RADIO FADING CHANNELS.** Demand Time Assigned Speech Interpolation (D-TASI) has been proposed as a means of more efficiently using the radio spectrum allocated to mobile radio systems. In the D-TASI system, the delay experienced in accessing the message channel in order to transmit a voice packet is a major obstacle to the practical implementation of the system. Access schemes for D-TASI are considered. Three access schemes have been proposed and their theoretical models developed; computer software packages have also been developed to simulate the three proposed schemes - Aloha, Polling, and Table-driven. The probability of call blocking as a function of user population, voice channel traffic intensity and time-slot duration has been studied. (Edited author abstract) 12 refs.

Sheikh, A.U. (Carleton Univ, Ottawa, Ont, Can); Nguyen, N. *J Inst Electron Radio Eng* v 57 n 6 Nov-Dec 1987 p 304-311.

**088077 PERFORMANCE ANALYSIS OF GMSK FREQUENCY DETECTION WITH DECISION FEEDBACK EQUALISATION IN DIGITAL LAND MOBILE RADIO.** The bit-error-rate (BER) performance of premodulation Gaussian filtered MSK (GMSK) using frequency detection (FD) in conjunction with 1 bit decision feedback equalisation (DFE) is theoretically investigated. The introduction of the premodulation filter causes severe intersymbol interference (ISI) in the waveform of the input to the fm modulator. DFE is used for reducing the ISI effect and therefore improving the BER performance. Applying the analysis to additive white Gaussian noise (AWGN) channels (no fading) shows that a 1-bit DFE attains about 8.5 db  $E_b/N_0$  improvement at  $BER=10^{-3}$  for the premodulation filter bandwidth-time product  $B_bT=0.25$  when the receiver predetection bandpass filter bandwidth-time product BT is optimised. It is shown that the effect of error propagation due to DFE is negligible and the exact BER can be approximated by the BER that is obtained assuming the decision 1-bit prior is correct. The analysis is extended to Rayleigh fading channels. Both predetection and postdetection diversity reception are considered. When two-branch predetection maximal-ratio combining (MRC) is used, the 1-bit DFE attains about 6.3 db  $E_b/N_0$  improvement at  $BER=10^{-3}$  for  $B_bT=0.25$ . (Author abstract) 8 refs.

1988 p 199-207.

**088078 INFLUENCE OF ENVIRONMENTAL CONDITIONS ON BER FOR WIDEBAND MOBILE RADIO CHANNELS.** Mobile radio system performance is strongly influenced by random signal distortion due to severe radio propagation conditions. The paper presents the results of a software simulation, performed with the aim of analyzing the importance of the parameters and of the functions characterizing the different environmental conditions. As the basis for the computations, we assume the experimental results obtained in the research activity for the new digital Pan-European system. The results here presented are related to the irreducible probability of error for a BFSK system, which was thought to be the most appropriate for emphasizing the effect of the random channel. **088079 BERECHNUNG DER UEBERTRAGUNGSSICHERHEIT VON ZEICHEN FUER MOBILFUNKSYSTEME.** [Calculation of Transmission Reliability of Signals for Mobile Radio Systems]. A statistical model is considered of received signals that are present in narrowband mobile radio systems. The simulation of such signals is considered. A computation method for the determination of the transmission reliability of signals is derived with the aid of simple statistical methods. 4 refs. In German.

Konig, Peter. *Tech Mitt PTT* v 66 n 2 1988 p 49-56.

**088080 OUTAGE PROBABILITY IN CELLULAR MOBILE RADIO SYSTEMS.** This paper presents two new methods for computing the outage probability of a cellular land mobile radio system with narrowband modulation and digital transmission of speech. They are well suited to compare different system solutions, since they take into account the main characteristics influencing the transmission performance, i.e., modulation methods, power control, antenna radiation patterns, adjacent- and co-channel interference arising from the frequency reuse, propagation impairments due to a log-normal shadowing fading and to fast Rayleigh fading. The paper reports some computations on the long-term median value of the useful to interfering signal ratio vs the position of the useful mobile unit in the service area. It gives the frequency reuse configurations acceptable according to the presented outage probability methods relevant to different mobile radio systems and compares the pertaining telephone traffic efficiencies. It also introduces the main features of a SCPC/FDMA mobile radio system. (Edited author abstract). 26 Refs.

## Reviews

**088081 COVERAGE PREDICTION FOR MOBILE RADIO SYSTEMS OPERATING IN THE 800/900 MHZ FREQUENCY RANGE.** After an extensive list of definitions, a listing and brief description is given of a number of communication systems in the 800/900 MHz frequency bands. Modes of propagation are reviewed in depth and the effects of buildings, trees, and other interference are noted. Antenna characteristics and system losses are discussed. A variety of experimentally or theoretically based propagation models, developed to predict radio propagation in land mobile systems, are then examined. After listing and summarizing the major features of the models, the models are compared in terms of the environmental and propagation factors they account for, and in terms of the output information they provide. The median transmission loss predictions of various models are compared for a given base antenna site.

A detailed evaluation is provided to evaluated predictions obtained in the following basic situations: smooth terrain between base station and mobile; smooth terrain with a knife-edge obstacle located close to the mobile; and smooth terrain with a knife-edge obstacle at the midpoint of the path. Recommendations on measurement procedures are offered by the Committee on Radio Propagation. Factors affecting the choice of a propagation model for particular applications are discussed. 128 refs.

## Space Applications

**088082 AVERAGE WAITING TIME FOR MOBILE RADIO TERMINALS ACCESSING A BATCH-PROCESSING DISPATCHER BY SATELLITE.** To minimize call set-up overheads, a demand assignment scheme for mobile radio networks over a satellite has been proposed, in which calls are processed by the network dispatcher in batches. The letter examines the average waiting time for calls to be processed under this service discipline. (Author abstract). 9 Refs.

Leung, V.C.M. (Chinese Univ of Hong Kong, Shatin, Hong Kong). *Electron Lett* v 24 n 15 Jul 21 1988 p 940-941.

**088083 MEASUREMENTS AND MODELS OF A LAND MOBILE SATELLITE CHANNEL AND THEIR APPLICATIONS TO MSK SIGNALS.** The fading and shadowing effects observed on land mobile satellite signals are characterized in statistical terms. Models are developed in terms of probability distribution of the signal's envelope and phase as well as its rate of change with time. The multipath fading and shadowing effects modeled are typical of those encountered in a mobile-satellite link in rural and suburban areas. The predictions of the models are compared with experimental data at 870 MHz and 1542 MHz. Applications of the models to predict performance of a minimum shift keying (MSK) signal at 2400 b/s show that: (1) large margins are required to compensate for the effects of fading and shadowing; (2) conventional coherent demodulation of a MSK signal may not be feasible due to phase variation caused by fading and shadowing; and (3) random FM has negligible effect on the probability of error of the MSK signal at 2400 b/s when frequency demodulation is used. 12 refs.

Loo, Chun (Communications Research Cent, Ottawa, Ont, Can). *IEEE Trans Veh Technol* v VT-36 n 3 Aug 1987 p 114-121.

## Standards

**088084 SPRACHCODEC FUER DAS EUROPAEISCHE FUNKFERNSPRECHNETZ.** [Speech Codec for the European Mobile Radio System]. The speech encoding algorithm is described which has been developed recently in the context of the standardization of the forthcoming European digital mobile radio system (D-net). The speech codec is based on the German codec proposal which has been selected by the CEPT 'Groupe Speciale Mobile' (GSM) as a result of extensive subjective listening tests. The encoding principle is a residual excited linear prediction technique using 'Regular-Pulse Excitation'. This proposal has been re-optimized by a Franco-German collaboration, by adding a long-term predictor. Thus the net-bit rate has been reduced from 14.77 kbit/s to 13.0 kbit/s. The present implementation is presented and the current status of the standardization is described. (Author abstract) In German. 13 refs.

Vary, Peter (Philips Kommunikations Industrie AG, Nuremberg, West Ger); Hofmann, Rudolf. *Frequenz* v 42 n 2-3 Feb-Mar 1988 p 85-93.

**088085 AUTOMATIC TUNING CAR RADIO BASED ON THE RADIO DATA SYSTEM.** The radio data system (RDS) is a standard for transmission of

supplemental information for FM sound broadcasting that was agreed upon by the European Broadcasting Union in 1984. A car radio with novel functions has been developed that is based on the RDS. An RDS decoder IC and an automatic tuning function are among the features of the radio. Increases in cost and assembly space required for the receiver circuits have been minimized through the use of a single RF front-end structure and the single-chip RDS decoder. 5 refs.

**088086 MULTI-TERMINAL CORDLESS TELEPHONE SYSTEM.** Cordless telephone systems have a fixed node (FN) and a mobile terminal node (MTN), and the radio link control between these nodes is performed autonomously. An enhanced radio link system, 'multi-terminal cordless telephone system,' that enables connecting multiple MTNs to a single FN has been developed and is discussed in this paper. The system features radio link control for collision avoidance and a state transition diagram are presented. An experiment for fluorescent light noise reduction by a syllabic compandor and the overall characteristics of some trial radio sets are also discussed. (Author abstract) In Japanese. 5 refs.

**088088 COHERENT DEMODULATOR FOR MOBILE AUTOMATIC TELEPHONY.** Digital transmission of speech is becoming a preferred solution for Mobile Automatic Telephony and cordless telephones. The proposed systems will operate above 900 MHz and at these frequencies the radio channels suffer from multipath and Rayleigh fading. As the received signal goes through deep fades the demodulator loses synchronization and produces a burst of errors while it is re-synchronizing. Coding techniques are used to detect and correct these bursts but coding complexity increases with burst length. Fast acquisition demodulators give shorter bursts and are therefore desirable. Most existing coherent demodulators use long time constants in their clock and carrier recovery circuits and hence take too long to synchronize. Non-coherent demodulators have been preferred because of their fast acquisition performance but give higher error rates. We describe a technique which allows coherent demodulators to acquire synchronization quickly. 5 refs.

**088091 RESOURCE ALLOCATION TECHNIQUE FOR FDMA SYSTEMS.** We present a resource allocation problem which can be viewed as a model for the problem of finding a compatible frequency plan for the required voice channels in FDMA mobile radio telephone systems. A general and efficient algorithm solving the problem approximately is described in detail. It relies on the determination of a priori bounds on the frequency demand combined with an iterative nondeterministic assignment strategy. The possibility of extending these ideas to TDMA systems is discussed briefly. (Author abstract). 30 Refs.

## France

**088092 PAN-EUROPEAN DIGITAL CELLULAR SYSTEM FOR MOBILE TELEPHONES.** In 1987, the European Conference of Post Offices and Telecommunications administrations (CEPT) decided to define a unique system of digital radiotelephony which is to be launched on the market in 1991. This system uses the TDMA (Time Division Multiple Access) technology to access the radio resource combined with frequency hopping and narrow-band operation. Matra Communication has already made the technical and architectural choices for the system it is offering to build a network of this type: specifically, decentralization of functions and equipment modularity. These choices have already been put into practice as part of the new development in the French high density radiotelephony network produced by Matra Communication for France Telecom. (Author abstract) 1 Ref.

Duplessis, P. (Matra Communication); Maillard, F. *Communication Transm* v 10 n 2 1988 p 5-14.

## Italy

**088093 CELLULAR MOBILE TELEPHONE SYSTEM RTMS.** The paper outlines some of the principal features of Radio Telephone Mobile System (RTMS), including a discussion on capacity in view of recently upgraded nationwide subscriber capacity objective of 200,000. Italy's 450 MHz first cellular radio system is considered, pointing out that RTMS's overall architecture has been made to conform to the nationwide expected subscriber density distribution, both in the major metro-

politan areas and in the other numerous cities. (Author abstract). 7 Refs.

## Mathematical Models

**088095 MODELING AN AUTOMATIC RADIO TELEPHONE NETWORK.** To study the performance of this radio telephone network, we perform simulations and use an iterative method including two steps: aggregation and disaggregation. The aggregation step corresponds to the simulation of each relay. Each relay is studied independently of the others. The outside influence is reduced to: the call rate from other relays and the entrance rate for vehicles from an outside area. The disaggregation step is the global study of the whole system. Each of the relays is replaced by a simple equivalent that is deduced from the preceding step. Before applying this iterative method, it is necessary to obtain the state probabilities of the displacement model. We assume that the vehicles spend an amount of time in each area that is exponentially distributed. Then by applying Chapman-Kolmogorov equations, we get a linear system whose solutions let us derive the expected values of the number of vehicles within each area. (Edited author abstract) 11 refs.

## Paging Systems

**088096 UNI-DIRECTIONAL SATELLITE PAGING SYSTEM FOR LAND MOBILE USERS.** A satellite ground segment which is capable of supporting a uni-directional paging service for land mobile users is described. The system is configured around existing satellites and the VHF wide-area paging network. A suitable transmission format is proposed which employs multi-level frequency shift keying, dual time diversity and Reed-Solomon forward error correction. The anticipated performance of the transmission format is discussed. Proposed implementations of the mobile paging receiver and transmitter data-formatting modulation equipment are presented. (Author abstract) 11 refs.

## Equipment

**088098 A DUAL-CHANNEL COOLED GaAsFET RECEIVER FOR THE DOMINION RADIO ASTRONOMICAL OBSERVATORY 26-METRE RADIO TELESCOPE COVERING 1.35 TO 1.75 GHz.** A low-noise receiver for a radio telescope is described. Two identical three-stage GaAsFET amplifiers were built which give excess noise temperatures of less than 28 K with at least 34 dB gain between 1.35 and 1.75 GHz when operated at a physical temperature of 12 K. This noise temperature is measured at the cryostat input connectors. The physical temperature is maintained by a closed cycle helium refrigerator. Source-inductance feedback is used to allow optimum noise performance combined with good input match. Return loss is better than 15 dB across the band. Construction details of the amplifiers and their mounting in the cryostat are provided. Sample observational results are presented. (Author abstract). 18 Refs.

## Absorption

**088103 BETTER RCS DATA WITH ANECHOIC ABSORBER CHARACTERIZATION.** The first complete evaluation of anechoic absorbers will help compact range users get improved RCS measurements. The new measurement technique described eliminates the problems of the NRL arch method and is much different than other previously used methods. Instead of using the conventional NRL arch technique to evaluate anechoic absorbers, three different types of measurement techniques were used. The measured absorber results are useful in developing much needed chamber performance models. Knowledge of absorber material behavior can be used as input for computer programs for designing anechoic chambers and compact ranges. 10 refs.

## Analysis

**088104 RADIO PROPAGATION CHARACTERISTICS IN UNDERGROUND STREETS CROWDED WITH PEDESTRIANS.** Radio-wave propagation characteristics are measured in an underground street crowded with pedestrians and the attenuation constant from 250 MHz to 12.4 GHz is derived. It is experimentally proven that the attenuation constant decreases with increasing frequency. In the analysis, the region with pedestrians is modeled as a lossy, homogeneous dielectric slab. Based on the method of effective dielectric constant, the field distribution and the attenuation constant are calculated. Although this method is an approximate approach, it is expected to work for the problem of propagation characteristics in guides crowded with pedestrians or obstacles. 15 refs.

## Attenuation

**088105 ATTENUATION ON AN EARTH-SPACE PATH IN RAIN AT 22 GHz.** It has been found that attenuation on an Earth-space path in rain at 22 GHz can be estimated by a combination of the CCIR method of predicting rain attenuation and a spectroscopic calculation of atmospheric attenuation based on aerological data. The magnitude of rain attenuation at 22 GHz is about 3.5 times that at 12 GHz, and atmospheric attenuation to be added to rain attenuation is about 2.5 dB at 22 GHz on paths to a broadcasting satellite in Japan. To avoid lengthy computations, a simplified method was derived for estimating atmospheric attenuation in rain on an Earth-space path at 22 GHz. 7 refs.

Ito, Shiro (NHK, Tokyo, Jpn). *NHK Lab Note* 351 Oct 1987 p.

**088106 IMPROVED PREDICTION METHOD FOR RAIN ATTENUATION IN SATELLITE COMMUNICATIONS OPERATING AT 10-20 GHz.** Several prediction methods for rain attenuation presented so far are evaluated using a common long-term data base (total 124 sets of measurements) for oblique propagation paths with frequencies of from 10 to 20 GHz, and an improved

prediction method reflecting the evaluation results performed is proposed. The evaluation results indicate that CCIR methods give relatively high precision, although in this respect, there is not such a great difference from other methods. The method proposed includes a rain area size parameter as a function of rain rate for 0.01% of the time to minimize the prediction error. It is verified that the method thus obtained gives the best precision, at the present time, for predicting rain attenuation on Earth-to-space propagation paths at 10-20 GHz. (Edited author abstract) Refs.

**088107 CALCULATION OF THE STATISTICAL CHARACTERISTICS OF BACK-SCATTERED SIGNALS IN A RANDOMLY IRREGULAR IONOSPHERIC WAVEGUIDE.** The reciprocity theorem is used to derive an expression for the correlation function of back-scattered signals in a randomly irregular ionospheric waveguide. The derivation takes into account the directivity of the transmitting and receiving antennas, the parameters of the radiated signal and receiving filter, nonstationarity of the ionosphere, and radio wave absorption. It is shown that the solution of the statistical problem is much simpler when one takes advantage of the quasiperiodic nature of the waveguide ray paths. Calculations are carried out for a model of a randomly irregular waveguide. (Author abstract) 6 refs.

**088108 BACKSCATTERING BY LOADED AND UNLOADED DIHEDRAL CORNERS.** An accurate mathematical model for the assessment of the backscattering from a loaded dihedral-corner reflector is solved using a technique which is a generalization of physical optics (PO) methods to loaded surfaces, improved by taking into account the lighting of each face by the rays diffracted by the edge of the other one. The inclusion of the currents due to such diffracted fields in the PO current distribution has been found relevant in order to improve the accuracy of the solutions. The solution is uniform with respect to the loading impedance; it coincides with a previously obtained solution for the perfectly conducting case, when the loading impedance approaches zero. 20 refs.

**088109 METHOD TO CORRECT HF SKYWAVE BACKSCATTERED SIGNALS FOR IONOSPHERIC FREQUENCY MODULATION.** A method is described to correct HF signals reflected by the ionosphere and backscattered by the sea surface for ionospheric frequency modulation, which produces spectral-line smearing. The statistical mean of the time derivative of the phase of the signal, weighted by the signal energy, is proposed as an estimator of this modulation. The accuracy of the estimator is measured and the efficiency of the signal processing is tested by synthetically contaminating high-quality signals obtained via sporadic E-layer propagation. Examples of data corrected for F2-layer ionospheric perturbations are shown. 15 refs.

Parent, Jacques (Univ Paris, Fr); Bourdillon, Alain. *IEEE Trans Antennas Propag* v 36 n 1 Jan 1988 p 127-135.

**088110 SPECIAL PROBLEMS IN APPLYING THE PHYSICAL OPTICS METHOD FOR BACKSCATTER COMPUTATIONS OF COMPLICATED OBJECTS.** The backscatter computation of complicated objects is carried by the physical optics (PO) method, known as the vector Kirchhoff approximation. The object is described by a geometrical model using flat plates (panels). These panels can be nonperfectly conducting and multilayered. The PO solution for the scattering matrix of a single multilayered panel is evaluated in detail using the Fresnel reflection coefficients. An example of the computed reflection coefficient of a two-layered medium is presented. The phase integral of the PO method is solved analytically. The hidden-surface problem is discussed, and the procedure for the treatment of doubly reflecting panels is described. For an ideal conducting cube with additional surfaces that generate shadow and double-reflection effects, the computed radar cross section (RCS) is compared with measurements. Computational results of the RCS for nonperfectly conducting panels are given. 7 refs.

**088111 APPLICATION OF A CONJUGATE GRADIENT FFT METHOD TO SCATTERING FROM THIN PLANAR MATERIAL PLATES.** The backscatter cross section is calculated for thin material plates with finite electric permittivity, conductivity, and magnetic permeability illuminated by a plane wave. The plates are assumed to be planar with an arbitrary perimeter. The integral equations are formed and solved by a combined conjugate gradient-fast Fourier transform (CG-FFT) method. The CG-FFT method was tested for several geometries and materials measured and computed backscatter results are compared for a perfectly conducting equilateral triangle plate, a square dielectric and magnetic plate, and a circular dielectric plate. The agreement between measured and computed data is generally good except toward edge-on incidence where several factors cause discrepancies. Accurate approximations to the geometry and far-field integrals become critical near edge-on incidence and, it is postulated that as the incidence angle approaches edge-on, the sampling interval and tolerance should be decreased. 14 refs.

**088112 COMPUTER-AIDED VHF/UHF FIELD-STRENGTH PREDICTIONS.** The article proposes an empirical method for the calculation of field-strengths in the VHF and UHF broadcasting bands over known orographic profiles between the transmitting and receiving points. The profiles are obtained from the Italian terrain data bank. Allowances are made for various types of propagation: diffraction by different types of obstacles, troposcattering, super-refraction and tropospheric ducting over sea paths. A comparison is made between the calculated field-strengths and measurements taken in rural sites away from natural and artificial obstacles. An example is given of the way in which the propagation model has been applied to the calculation of interfering field-strengths in the service areas of the RAI broadcasting transmitters. (Edited author abstract). 27 Refs.

**088114 TRANSMISSION OF LOG-PCM VIA QAM OVER GAUSSIAN AND RAYLEIGH FADING CHANNELS.** The digital noise power due to transmission errors is determined for 8-bit  $\mu$ -law PCM,  $\mu=255$ , signals transmitted via M-level QAM,  $M=16, 64$  and  $256$ , over Gaussian and Rayleigh fading channels. The analytical results apply for various laws that map the 8-bit  $\mu$ -law PCM signal into the QAM format, and for different binary Gray codes used to represent the QAM signal points. In addition to the theoretical results expressed as overall speech snr as a function of channel snr for different input speech signal levels, simulations for Gaussian and mobile radio channels using speech signals are also presented. We conclude that the 256-level QAM system employing the best mapping law and Gray code has a gain of about 6 db in overall speech snr compared to transmission without coordination of the speech bits over a Gray-coded link. Corresponding gains for 16-level and 64-level QAM are marginally smaller. By increasing the number of QAM levels from 4 to 256, the required increase in channel snr per bit to maintain an overall speech snr of 30 db is approximately 12 db. The bandwidth efficiency increases by a factor of four. (Edited author abstract) 23 refs.

Steel, R. (Univ of Southampton, Southampton, Engl); Sundberg, C.-E.W.; Wong, W.C. *IEE Proc Part F* v 134 n 6 Oct 1987 p 539-556.

**088115 LOGARITHMIC PCM WEIGHTED QAM TRANSMISSION OVER GAUSSIAN AND RAYLEIGH FADING CHANNELS.** The transmission of 8-bit  $\mu$ -law PCM signals using M-level weighted QAM (WQAM),  $M=16, 64$  and  $256$ , over Gaussian and Rayleigh fading channels is examined. The weighting process modifies the positions of the QAM constellation points so that the overall distortion in the recovered information-bearing source signal is reduced. The PCM bits are mapped to the WQAM points such that the most significant bits have a lower probability of being in error than the least significant bits. Gray coding of the constellation points is also used. The WQAM systems have been optimized for the same average signal energy per transmitted symbol as for unweighted QAM. Optimized systems have also been derived for the same peak signal energy per symbol. The theoretical and simulation results using speech indicate that 16-level and 256-level WQAM have a gain of up to 3 and 5 db, respectively, over unweighted QAM for the Gaussian channel. The gains due to weighting for 16-level QAM operating over an ideal slow Rayleigh fading channel are up to 5 db. (Author abstract) 21 refs.

**088116 CALCULATE BIT ERROR RATE FOR DIGITAL RADIO SIGNAL TRANSMISSION.** Several methods estimate the symbol error rate caused by imperfect transmission channels such as filters, nonlinear elements, multipath propagation, and channel interference. The author claims that the method presented is the only one relating the symbol error rate to the parameters of peak-to-peak amplitude and phase ripple, maximum gain slope, and maximum group delay distortion, which are commonly used to characterize and arbitrary linear transmission channel. This method calculates the performance degradation of quaternary phase-shift keying (QPSK), offset quaternary phase-shift keying (OQPSK), and M-ary phase-shift keying (MSK) signals transmitted over a wideband channel, exhibiting either sinusoidal amplitude ripple or sinusoidal phase ripple. 2 refs.

Sandberg, Jorgen (ESA, Noordwijk, Neth). *Microwaves RF* v 26 n 6 Jun 1987 p 97 and 106.

**088117 EFFECTS OF CORRELATED FADING ON LEVEL CROSSING RATES AND AVERAGE FADE DURATIONS WITH PREDETECTION DIVERSITY RECEPTION.** General expressions for the level crossing rate (LCR) and average fade duration (AFD) are obtained for several diversity combining schemes employing two-branch predetection reception of correlated Rayleigh fading signals. These expressions are obtained from joint and conditional probability density functions (PDFs) of the received signals, and lead to a unified treatment. This simplified method contrasts with the characteristic function approach used in previous investigations. Numerical results are presented for a space-diversity system using horizontally spaced antennas at a mobile station. It is shown that while the angle between the antenna axis and the direction of vehicle motion does not appear in the cumulative distribution function (CDF) of the combined output signal envelopes, it affects the LCR and AFD when the two fading signals are correlated. When the two antennas parallel with the direction of vehicle motion are used, the LCR can be reduced below the value obtainable from signals which fade independently. When the two antennas are perpendicular to the direction of vehicle motion, the AFD is loosely dependent on the antenna spacing and, provided the antenna spacing is not too small, is approximately half that for the no-diversity case. (Author abstract) 12 refs.

**088121 HILLY TERRAIN LOS FADEOUTS AND FRESNEL ZONE CONSIDERATIONS FROM RAY TRACING TECHNIQUES.** The Tiruttani-Tirupati line-of-sight (LOS) communication link situated in hilly terrain and operating at 7 GHz suffers severe fadeouts during the early hours of the day in the months of February and March. To investigate if the fadeouts are due to insufficient obstacle clearance along the entire propagation path, the authors determine whether the first Fresnel-zone clearance is secured under varied atmospheric conditions. A computer program was developed using the ray-tracing technique to trace the path of the radio ray under the varied meteorological situations encountered when the fadeouts were observed. It was found that the fadeouts were due to insufficient clearance at the hilltop, usually during subrefractive conditions. 9 refs.

**088122 IMPACT OF FREQUENCY-SELECTIVE FADING ON DIGITAL LAND MOBILE RADIO COMMUNICATION AT TRANSMISSION RATES OF SEVERAL HUNDRED KBIT/S.** Computer simulations of mobile-radio-channel transfer functions have been performed using data from measurements in New York City and the city of Berne, Switzerland, and its outskirts. It is demonstrated that the impulse response may suffer considerably from large variations of the channel characteristics. It is concluded that powerful means of signal processing are necessary to safeguard digital land-mobile radio communication at transmission rates of several hundred kilobits per second. 15 refs.

**088123 EFFECTS OF MULTIPATH DELAY SPREAD ON TIMING RECOVERY.** Equations for the recovered timing for a squaring timing recovery circuit under multipath radio propagation are derived. Both coherent and differential detections are studied. If delay spread is much smaller than the symbol duration, the recovered timing can be approximated by the centroid of the power delay profile,  $p(t)$ . Two cases of timing loop bandwidth are considered. If the fading frequency is much lower than the bandwidth of the timing loop, the instantaneous sample of  $p(t)$  is used to generate the timing clock. If the fading frequency is much higher than the loop bandwidth, the ensemble average of  $p(t)$  over fading samples is used to recover the timing. A computer simulation of a system operating in a frequency-selective, slowly fading environment shows that for root mean square (rms) delay spread less than or equal to 0.1 of the symbol duration, a squaring timing loop with either narrow or wide bandwidth can properly determine the timing detection. The main mechanism of the irreducible bit error rate in this case is the closure of the eye-pattern instead of timing error. 11 refs.

**088124 LOW ANGLE SIGNAL FADING AT 38 GHz IN THE HIGH ARCTIC.** The results from a 1984 microwave propagation experiment conducted at 83°N latitude to study the characteristics of low-angle fading at a frequency of 38 GHz are reported. By monitoring the continuous-wave (CW) signal transmitted from the orbiting LES-8 satellite, propagation data were gathered over a range of elevation angles from 1° to 21°. A total of three

sets of measurements were made in the spring, summer, and winter. These allowed comparisons to be made of the seasonal characteristics of low-angle fading in the Arctic. The experimental data were examined with respect to the atmospheric conditions observed. The results presented include the variation of the median signal level with the elevation angle, cumulative distributions of the received signal level, and fade-rate statistics. The amount of signal fading increased rapidly as the elevation angle decreased. Fading was most severe in the summer, which also had the highest fade rates. Very little fading was observed in the winter. 10 refs.

**088125 FADE MEASUREMENTS AT L-BAND AND UHF IN MOUNTAINOUS TERRAIN FOR LAND MOBILE SATELLITE SYSTEMS.** Fading results related to land mobile satellite communications at L-band (1502 MHz) and UHF (870 MHz) are described. These results were derived from an experiment performed in a series of canyon passes in the Boulder, Colorado region of the US. The experimental configuration involved a helicopter as the source platform, which maintained a relatively fixed geometry with a mobile van containing the receiver and data-acquisition system. An unobstructed line of sight between the radiating sources and the receiving van was, for the most part, also maintained. In this configuration, the dominant mechanism causing signal fading (or enhancement) is a result of multipath. The resulting fade distributions demonstrated that at the 1% and 5% levels, 5.5- and 2.6-dB fades were on the average exceeded at L-band and 4.8- and 2.4-dB at UHF, respectively, for a path elevation angle of 45°. The canyon results as compared with previous roadside-tree-shadowing results demonstrate that the deciding factor dictating fade margin for future land mobile satellite systems is tree shadowing rather than fades caused by multipath. 9 refs.

## Imaging Techniques

**088126 SUPERRESOLUTION OF NEAR OR FAR FIELD COHERENT TARGETS USING APERIODIC ANTENNA ARRAYS.** A technique for obtaining high-resolution images of pointlike coherent targets using aperiodic antenna arrays is developed. Whereas existing superresolution techniques can be used to image coherent targets located only in the far field of periodic receiving arrays, this technique can be used to obtain high resolution images of targets in the near field also. The key to this technique is the use of multiple transmitters. Completely correlated (coherent) targets are decorrelated by transmitting sequentially from different locations, thereby enabling the use of modern superresolution techniques to estimate the target locations. An expression for estimating the variance of the target locations is derived, and is verified by empirical methods. For the same amount of transmitted power and the same number of receivers, this variance is shown to be an order of magnitude smaller than that of existing superresolution techniques. The practicality of this technique is demonstrated with experimental microwave data. 21 refs.

## Industrial Applications See INVENTORY CONTROL—Equipment.

## Mathematical Models

**088127 CONSTRUCTION OF CONSISTENT ESTIMATES.** A theorem which enables one to obtain consistent estimates of distribution parameters, when the generalized method of moments does not yield results, is formulated and proved. Rice's and Likhter's distributions are discussed as examples. The probabilistic characteris-

tics of the estimates obtained are determined. (Author abstract) 10 refs.

**088128 APPLICATION OF THE COMPENSATION THEOREM TO KNIFE-EDGE DIFFRACTION OVER A PLANE EARTH.** The problem of radio wave propagation over a simple knife-edge, with both transmitter and receiver at ground level, is considered by means of the vector form of the Compensation Theorem. The intervening ground is assumed to be flat and to have the same normalized impedance as the knife-edge. Analytical results for the attention factor are given for both perfectly and finitely conducting ground. (Author abstract). 3 refs.

## Microwaves

**088129 ON THE WORLD'S WAVELENGTH.** BNR engineers have developed a new digital microwave radio system, called the RD-6B, that employs efficient 64 quadrature amplitude modulation (QAM) techniques to increase the spectral efficiency of radio channels worldwide. The RD-6B incorporates new DM-140 signal processors and interfaces to transmit signals at 140 Megabits per second (Mbit/s), a standard transmission rate in Europe and in many other parts of the world.

## Monitoring

**088130 SHORTWAVE BROADCASTING BAND SPECTRUM OCCUPANCY AND SIGNAL LEVELS IN THE CONTINENTAL UNITED STATES AND WESTERN EUROPE.** The initial results are described for monitoring using a mobile spectrum monitoring unit (MSMU) that has the capability of fast sampling of radio signals in the frequency spectrum between 2 MHz and 1 GHz. In the summer and fall of 1987, the MSMU was used to measure signal level and spectrum occupancy in the shortwave band (2-30 MHz) at four locations in the continental United States (CONUS) (i.e., Stanford, California; Ft. Huachuca, Arizona; Ft. Sill, Oklahoma; and Annapolis, Maryland) and at two locations in Europe (Seckenheim and Geinsheim, Federal Republic of Germany). After the measurement period, the recorded data were used to compute occupancy statistics at 111 signal amplitude thresholds. Comparison of spectrum-occupancy and signal-level data between CONUS and Europe is reported. 11 refs.

## Noise

**088131 ON THE UNIVERSALITY OF THE METHOD OF CONVERTING THE ATMOSPHERIC RADIO NOISE DISTRIBUTION FUNCTION FROM BAND TO BAND USING A GENERALIZING EMPIRICAL MODEL.** The capabilities of a method (developed earlier by the author) of converting the atmospheric radio noise distribution function from band to band, using an empirical model whose parameters were directly calculated using a computer, were demonstrated on the basis of the experimental data. The method was illustrated for the case when the conversion factor of the bands  $\omega = B_2/B_1 > 1$  ( $B_1$  is the original bandwidth and  $B_2$  is the final bandwidth). The purpose of this paper is to show that the method of converting the distribution function is quite general and can be used for  $\omega < 1$ . The method exhibits universal properties and can be used to an equal extent for both increased or decreased receiver passband. 8 refs.

Osinin, V.F. *Sov J Commun Technol Electron* v 31 n 12 Dec 1986 p 216-217.

**088132 RANDOM FM NOISE WITH SELECTION COMBINING.** Random FM noise using two-branch selection combining with correlated Rayleigh fading signals is analyzed for land mobile radio systems. General expressions are derived for the cumulative distribution function and mean square value of the random FM noise; they can be applied to any type of diversity such as space, polarization, etc. Calculated results show that, if two horizontally spaced antennas parallel with the direction of vehicle motion are used at a mobile station, random FM noise can be significantly reduced for small antenna spacings. 6 refs.

## Optimization

**088133 OPTIMUM PROPERTIES OF ENSEMBLES OF BINARY SEQUENCES.** It is shown that the families of Casami, Gold and bent functions are rigorously optimum functions with respect to the index of maximum correlation surge in an ensemble of given volume. They are asymptotically optimum with respect to the mean-square level of the periodic mutual uncertainty function in a symmetrical Doppler band. (Edited author abstract) 15 refs.

**Propagation** See Also RADIO SYSTEMS, MOBILE—Reviews.

**088134 HEINRICH HERTZ - THEORIST AND EXPERIMENTER.** It is argued that when Heinrich Hertz was appointed professor of physics at Karlsruhe in 1885 he was uniquely prepared for his historic experiments that opened the radio spectrum. Hertz made the first antennas and transmitter-receiver radio system and conducted a series of experiments which established that radio waves are identical to light except for their much greater length. His description of the radiation phenomenon remains the best ever written, revealing his tremendous depth of understanding of the subject. Hertz's training, studies, and experiments are recounted and measurements with a replica of his apparatus are described. 12 refs.

**088137 PROPAGATION OVER SHORT DISTANCES IN URBAN AND RURAL AREAS IN BAND II.** The article describes propagation measurements in Band II at distances from about 1 to 45 km from a transmitter in rural and urban areas in the western part of the Netherlands. The results are presented as curves showing field-strength as a function of distance. (Author abstract) 10 refs.

Doeven, J. *EBU Rev Tech* n 224 Aug 1987 p 191-197.

**088138 PARAMETRIC COUPLED SOLITONS IN TRANSMISSION LINES.** A method is proposed for suppressing dispersion distortions of a short radio pulse propagating in a transmission line. The conditions for which it is possible to have soliton wave packets with synchronous three-frequency interactions are found. It is shown that the intensity of a short data pulse can significantly exceed that of the two other waves, since the non-linear interaction is purely reactive. The results of numerical experiments are presented for realistic circuit parameters. (Author abstract) 14 refs.

**088139 ESTIMATION OF THE DELAY OF SUPER-WIDEBAND RADIO PULSES IN A MEDIUM AS APPLIED TO PROBLEMS OF SUBSURFACE RADAR.** The time delay of super-wideband radio pulses consisting of one or several oscillation periods in an absorbing medium with relaxation (Debye) polarization is calculated. This delay is compared with the case of propagation in a medium with the same phase velocity as at the maximum of the pulse spectrum. It is shown that a calculation for the known characteristics of sea ice reveals significant errors in determining the thickness of a layer using the phase velocity. (Author abstract) 6 refs.

**088141 ESTIMATION OF EARTH ELECTRICAL PROPERTIES USING CW AND FMCW GROUND WAVE PROPAGATION AT HF.** HF ground wave propagation should be well suited to the measurement of ground electrical conductivity and dielectric constant. Despite this, such measurements have historically proven to be unreliable. We have employed both CW and FMCW techniques to measure the ground wave basic transmission loss over paths between 10 and 100 km in length through a variety of terrains covering an area of about 1000 km<sup>2</sup> and to a surface depth approaching 5. Use of FMCW modulation over the longer paths permits rejection of skywave interference. The data recorded over flat terrain covering about 300 km<sup>2</sup> are compared with calculations from a model which includes a nonlinear least squares optimization routine with conductivity and dielectric constant as adjustable parameters. In this way we believe that we have reliably determined average values of conductivity and dielectric constant to a precision of about 25%, and that with improved system calibration an accuracy of 10% should become attainable. Possible sources of error are discussed. (Edited author abstract) 12 refs.

Thomas, R.M. (Defence Science & Technology Organization, Adelaide, Aust); Haack, G.R. *J Electr Electron Eng Aust* v 7 n 3 Sep 1987 p 214-220.

**088142 RAIN RATE PROFILES OBTAINED FROM THE DYNAMIC BEHAVIOR OF THE ATTENUATION OF MICROWAVE RADIO SIGNALS.** A mathematical model is presented which links the dynamical properties of microwave radio signal attenuation to the spatial rain rate structure of intensive showers. The theoretical relation found between attenuation and its rate of change is verified by radio wave propagation measurements on a satellite-Earth path at 11.5 GHz. (Author abstract) 20 refs.

**088143 PROPAGATION OVER AN INHOMOGENEOUS IRREGULAR SURFACE.** A new integral equation has been obtained for the attenuation factor of a radio wave launched by an elevated element, as the wave propagates over a radially inhomogeneous surface of varying height, with an elevated current element as a receiver. In the analysis use is made of the vector form of compensation theorem, using the concept of a real surface impedance on the irregular surface together with that of an equivalent normalized surface impedance in air, at points which follow the contour of the irregular surface. The new integral equation generalizes previous work to treat arbitrary terrain, so that both gradual and sharp changes of terrain height, such as a cliff and a knife edge, are considered. The validity of the integral equation has been tested theoretically by comparison with alternative solutions for particular cases, and also by experiment. (Author abstract) 13 refs.

**088144 MODELLING OF UHF RADIO WAVE SIGNALS WITHIN EXTERNALLY ILLUMINATED MULTI-STORY BUILDINGS.** A reliable model for UHF radiowave signal propagation into and variability within buildings is required to aid in the planning of cellular mobile radio systems serving portable transceivers. However, no such model has been presented in the literature to date and, with the imminent introduction of cellular mobile radio into New Zealand, a study of this problem has been undertaken with the aim of developing a model suitable for New Zealand buildings and situations. Two initial phases of this study have been completed in which suitable equipment and data collection and analysis procedures were established by conducting measurements at 927 and 851 MHz in a single building and at 851 MHz in another, dissimilar building where there was a line-of-sight path to all but one floor in both buildings. A preliminary model investigation using the data from unobstructed floors has shown that the measured cumulative probability density function of the received signal on a floor is best modelled by the Suzuki (Rayleigh plus log-normal) distribution and that the median signal level is not overly dependent on floor height. (Author abstract) 24 refs.

## Propagation in Guides

**088151 SOLAR ACTIVITY DEPENDENCE OF MF SKY-WAVE FIELD STRENGTH IN THE NIGHT-**

**TIME.** MF nighttime sky-wave field strength measurements have been made for ten years on board Japanese ice-breaker 'Fuji' while on its yearly voyage from Japan to Antarctica along a north-south course of approximately 10,000 km. From these measurements, clear solar activity dependence is found in that the field strength for the sunspot maximum period is higher by about 9 dB than that for the minimum period. In order to investigate the dependence which is contradictory to the currently accepted one, a numerical analysis of the ionospheric absorption using three-dimensional ray tracing technique was applied to the nighttime model ionosphere having typical distributions of electrons and collision frequency. Results of the analysis support those of the on-board measurements. Contradiction of the solar activity dependence, however, remains unsolved. (Author abstract) 14 refs.

**088153 RECONSTRUCTION OF THE STRUCTURE OF VOLUME INHOMOGENEITIES OF A MEDIUM.** Inverse problems of the reconstruction of the structure of bounded inhomogeneities in a medium from the scattered wave field of a point source are solved based on the scalar Helmholtz equation within the framework of the Born approximation and the method of smooth perturbations. The analysis is performed for the example of the problem of reconstructing the inhomogeneities of the isotropic ionosphere from scattered radio waves. Relations which enable one to determine the structure of the inhomogeneities with the Rayleigh limit of resolution with respect to the measured field in the Fresnel or Fraunhofer zone are obtained. Examples of the calculation of the resolution of the recording system are given. Integral equations whose solution enables the structure to be reconstructed with a resolution higher than the Rayleigh limit are derived. (Author abstract) 14 refs.

**088156 PECULIARITIES OF THE DEVELOPMENT AND SATURATION OF ARTIFICIAL IONOSPHERIC TURBULENCE DURING A HIGH-POWER DISTURBING TRANSMISSION.** The peculiarities of the wide-band anomalous attenuation of radio waves reflected in a region of the ionosphere disturbed by a high-power pumping wave are investigated experimentally. It is shown that saturation of the anomalous attenuation sets with an increase in the radiation power: Its intensity and time of development are stabilized. This indicates the saturation of the magnitude and spectrum of small-scale artificial inhomogeneities responsible for the effect of anomalous attenuation. The weakening of this effect in the process of development of large-scale artificial inhomogeneities is described. The results of an investigation of the initial stage of self-action of a high-power radio wave under the conditions of cyclic operation of the high-power transmitter are given. (Author abstract) 14 refs.

**088157 ABLEITUNG EINES FUNKSIGNALMODELLS DER IONOSPHERISCHEN UEBERTRAGUNG.** [Derivation of the Ionospheric Propagation Model of Radio Waves]. In the propagation of HF as well as MF electromagnetic waves over long distances the field strength in the target region varies. It is possible to explain the causes of these variations by defining the properties of a waves' propagation medium and their mutual interactions. The reception of information carried by such a wave can be made quite impossible by fading effects. The random processes describing the radio waves' behavior in the target region may be obtained from Gaussian processes. This paper analyses the amplitude and phase relations between the wave components and defines the conditions for random character changes with Rayleigh distribution at the receiving antenna. (Author abstract) In German. 5 refs.

**088159 VERTICAL ANGLE OF ARRIVAL OF HIGH-FREQUENCY SIGNALS PROPAGATING FROM THULE TO GOOSE BAY.** For brief periods in 1985 and 1986, the high-frequency radar system installed at Goose Bay, Labrador, was used to receive a signal transmitted from Thule, Greenland. With the dual an-

tenna arrays of the radar serving as an interferometer, it was possible to determine the vertical angle of arrival of the received signal. Two different experiments were performed. In one, the signal was swept in frequency from 8 to 20 MHz. In the other, eight discrete frequencies were used, with multiple samples taken for each frequency. From these data a Doppler power spectrum and a cross spectrum were formed, and the vertical angle of arrival was determined from the cross spectrum. Results often showed higher angles of arrival than would be expected, suggesting that the high-latitude ionosphere may exhibit unstratified structures (ionospheric tilts) that could significantly modify the nature of high-frequency communication channels. (Author abstract). 6 Refs.

**088160 STEERABLE ELF/VLF RADIATION PRODUCED BY AN ARRAY OF IONOSPHERIC DIPOLES GENERATED FROM HF HEATING.** A very low frequency (VLF) or extremely low frequency (ELF) dipole source has been created within the lower ionosphere by modulating the atmospheric dynamo currents with a ground-based high power HF source from the Arecibo Observatory. It was demonstrated that ELF or VLF generated in this way and injected into the earth-ionosphere waveguide could be received a few thousand kilometers away. The injection properties due to an array of ionospheric dipoles, as a function of array geometry and element currents, that will allow steerable ELF/VLF radiation within the earth-ionosphere waveguide, are investigated theoretically. The ionospheric array factors for a linear and a planar array of Hertzian dipole sources are developed and their properties examined. The principle of pattern multiplication is then applied to include the effect of the ionospheric array element. This provides a means for predicting the field strengths at a remote receiving site due to a steerable linear or planar array of ionospheric sources generated by high power HF periodic plasma heating. 22 refs.

**088161 SHORTWAVE PROPAGATION PREDICTION METHODOLOGIES.** The status of ionospheric-propagation prediction models is examined, with particular emphasis on the use of these models by the shortwave-broadcast community. Their stand-alone capability for forecasts is found to be limited by the use of monthly median, statistical averages of archived ionospheric data, as well as by the use of imprecise control parameter inputs, such as the sunspot number. A variety of developing technologies are discussed for improvement of prediction models. Improvement may result from observations of coronal holes and other relevant solar features for long-term and short-term ionospheric predictions. Also discussed are a variety of other ionospheric measurement schemes for short-term ionospheric predictions, such as the use of vertical-incidence, oblique-incidence, and backscatter sensing from space. The application of this class of measurements for adaptive HF broadcasting systems is discussed. Incorporation of ray-tracing into propagation calculations in the prediction model is also considered. 47 refs.

**088167 APPLICATION OF KOTEL'NIKOV'S THEOREM FOR DETERMINING THE CONDITIONS OF REGULARIZATION OF THE INVERSE PROBLEM OF REFRACTION.** The reasons for the appearance of instability in the solution of the inverse problem of refraction are analyzed using the discretization theorem (Kotel'nikov's theorem) and the exact analytical solution represented in the form of an integral transformation. The analysis shows that there exists a range in which the solution of the inverse problem is correct, occupying the spectral frequency range from 0 up to  $c/\pi$ , where  $c$  is a constant of the order of unity. In this

range the solution of the inverse problem is stable. The results of the analysis are illustrated by experimental data obtained in the course of one of the sessions of bistatic radar sounding of Venus. The analysis performed is of general value for all problems, which have an exponential order of incorrectness, including for problems of inversions of the Laplace, Stieltjes, and Mellin transforms in finite intervals. **088175 POWER SPECTRUM, ANTI-INTERCEPT AND SN RATIO CHARACTERISTICS OF DIRECT SEQUENCE SPREAD SPECTRUM COMMUNICATION SYSTEMS USING FIR AND IIR FILTERS.** The time series generated from a direct sequence spread spectrum (DS-SS) signal can be expressed in terms of an auto-recursive (AR) model. An all-zero FIR filter which are the inverse to each other, consist of the parameters of the AR model. We propose a spread spectrum communication system using a FIRF on the transmission side and an IIRF on the receiving side as well as a system using an IIRF on the transmission side and an FIRF on the receiving side. The former is called the DS-SS communication system using FIR-IIR filters and the latter the delay time in the delay element of the AR model of filters are selected properly by the former system, the mission signal can be spread more than that of the DS signal so that the density is lower and the peak value is suppressed. By the latter system, an optimum transmission becomes possible in the sense that the snr is maximum within the main lobe of the psd of the DS signal. (Edited author abstract) 17 refs.

**088176 ON PERMUTATION INVARIANT SYMMETRIC MULTIPLE ACCESS CHANNELS WITH APPLICATION TO MULTIPLE ACCESS SPREAD-SPECTRUM.** We consider the permutation invariant symmetric M-user multiple access and multiple interference channels. It is shown that choosing equal information rates for all users does not decrease the possible achievable total rate (for given input statistics) or the maximal total capacity (found by maximization of the total rates over all the allowable input statistics). This total rate is equal to the mutual information between the output of the channel and the output of the multiple-access (permutation invariant) device. These results are applied to the M-user binary adder channel corrupted by Gaussian noise, which is used to model coded, quasi synchronized, multiple-access, binary direct sequence spread spectrum systems. Upper and lower bounds on the total maximal achievable rate of reliable transmission of information are evaluated or any M. For  $M \rightarrow \infty$  Gaussian capacity (under the same average power constraints) is approached with users operating at equal powers and equal rates simultaneously. **088177 CYCLICALLY ORTHOGONAL SEQUENCES WITH LOW MULTIPLICITY OF VALUES DERIVED FROM QUADRATIC RESIDUES.** Orthogonal cyclic sequences with low multiplicity of values are given for application to spread spectrum communications systems. Two-, three-, and five-valued orthogonal cyclic sequences are obtained by representing real orthogonal cyclic sequences of length N by cosine series possessing phase constant of odd function, or even function with values  $\{0, \pi\}$ , and by relating the phase constant to quadratic residues of N. Three-valued orthogonal cyclic sequences are obtained by adding a dc component to quadratic residue sequences of these odd and even functions. A two-valued orthogonal cyclic sequence is obtained when a phase constant is given by a quadratic residue sequence of odd function multiplied by a constant. (Edited author abstract) 6 refs.

**088179 RAPID ACQUISITION SCHEME FOR SPREAD-SPECTRUM RADIO IN A FADING ENVIRONMENT.** A modified two-level scheme for coarse code acquisition of spread-spectrum signals in a fading environment is considered. The scheme uses a bank of passive correlators followed by a bank of active correlators. The passive correlators are matched to short sync prefixes, which are interspersed in the incoming signal.

The passive devices correlate over sliding windows (in time), providing a rapid search capability. Threshold exceedances of the passive correlators are used to initiate active correlation over longer time intervals so that high reliability of decision is obtained. The multiple sync prefixes reduce the probability of missing the signal in a fading environment. An analytical model based on queueing and detection theory results is developed, and optimization of the scheme is treated. A Gilbert model is used to characterize the signal fading on the channel. The performance in the presence of background noise with noise jamming is analysed. (Edited author abstract) 14 refs.

**088182 GENERALIZED ANALYSIS FOR A DUAL THRESHOLD SEQUENTIAL DETECTION PN ACQUISITION RECEIVER.** A dual threshold sequential detection receiver is analyzed and a general expression is derived which addresses the probability that the sequential detection pseudorandom noise (PN) acquisition procedure ceases after an arbitrary number of samples following which either a dismissal or detection declaration is made. This expression is made up of two terms which are related to crossing the upper and lower thresholds of a dual threshold receiver. In order to obtain a closed-form solution, an approximation was made in which the final expression was conditioned on the previous two samples. This expression is significantly more complex for dual threshold implementation as opposed to the single threshold/maximum sample time receiver design, and is needed in order to support a characteristic function approach in deriving acquisition probability as a function of time. 21 refs.

**088184 GENERALIZED MINIMUM SHIFT-KEYING MODULATION TECHNIQUES.** The simultaneous data demodulation and phase tracking of an MSK signal using the Viterbi algorithm is described, and two variations of MSK modulation are studied. The MSK with overlay is a dual-rate modulation technique in which low-rate and high-rate data are superimposed on an MSK signal. Here the demodulator uses the Viterbi algorithm to estimate both the low-rate and high-rate data simultaneously. The MSK with pseudorandom sequence spreading combats intentional or unintentional jamming. A simplified receiver for these spread-spectrum MSK signals is found that takes into consideration the effect of random phase perturbations. The performance of these demodulators is evaluated using transfer-function bounds for the bit error probability. For demodulation of the spread-spectrum MSK signal, a simplified receiver is derived, and its performance in the presence of continuous jamming is evaluated. 26 refs.

**088185 PERFORMANCE OF DS/SSMA COMMUNICATIONS IN IMPULSIVE CHANNELS - II: HARD-LIMITING CORRELATION RECEIVERS.** In part I it was demonstrated that impulsive channel noise can be a serious detriment to the performance of direct-sequence spread-spectrum multiple-access (DS/SSMA) communications when conventional linear correlation reception is used. Here, a hard-limiting correlator as an alternative for reception of multiple-access transmission in impulsive channels is considered. For K asynchronous binary PSK DS/SSMA users sharing a linear channel corrupted by impulsive noise that is modeled at the output of the front-end filter of the receiver, techniques are developed for analyzing bit error probabilities of this hard-limiting receiver by exact computation for short spreading sequences, by approximation for longer spreading sequences, and by asymptotic limits for infinitely long spreading sequences. Performance is compared to that of the linear correlator under a variety of conditions, showing that hard-limiting correlation reception can offer substantial improvement over conventional systems in impulsive channels. However, the linear receiver is more effective against multiple-access noise only, and so a tradeoff emerges between rejection of impulsive noise and rejection of multiple-access interference. 26 refs.

Aazhang, Behnaam (Rice Univ, Houston, TX, USA); Poor, H. Vincent. *IEEE Trans Commun* v 36 n 1 Jan 1988 p 88-97.

**088186 SPREAD-SPECTRUM MULTIPLE-ACCESS PERFORMANCE OF ORTHOGONAL CODES: IMPULSIVE NOISE.** A direct-sequence, spread-spectrum, multiple-access (SSMA) communication system that assigns a set of M-orthogonal sequences to each user is analyzed. An accurate model is incorporated for the impulsive noise that characterizes the LF and MF bands, so that the SSMA receiver operates in a combination of multiple-access interference and impulsive (atmospheric) noise. The performance of a linear receiver operating in such an environment is analyzed, and probability-of-error curves are presented. The presence of impulsive noise motivates the derivation and analysis of a nonlinear receiver that uses a variable-gain stage to suppress noise impulses. This receiver is effectively optimum when the signal amplitudes are below a certain bound and when the noise and interference samples are independent, or nearly so. However, the gain stage of this nearly optimum receiver depends on the noise model parameters including the various user delays. Consequently, a nonparametric receiver that incorporates a

simple clipper is also analyzed. The asymptotic relative efficiency of both receivers is determined. 25 refs.

**088188 REJECTION OF MULTIPLE NARROW-BAND INTERFERENCE IN BOTH BPSK AND QPSK DS SPREAD-SPECTRUM SYSTEMS.** The performance of direct-sequence spread-spectrum systems using a suppression filter in the presence of multiple narrowband interference with rational spectral densities is analyzed. Both BPSK and QPSK systems are considered, and analytical expressions for both the mean-square error of the filter output and the performance improvement are established. When the bandwidths of the narrowband components of the interference are all small, approximate expressions are obtained and used to provide further insight into the behavior of the system. Results are presented for the limiting case when the bandwidths approach zero (i.e., when multiple narrowband interference becomes multiple sinusoidal interference). 15 refs.

Wang, Yong-Cheng (Univ of California at San Diego, La Jolla, CA, USA); Milstein, Laurence B. *IEEE Trans Commun* v 36 n 2 Feb 1988 p 195-204.

**088189 PN CODE SYNCHRONIZATION EFFECTS ON NARROW-BAND INTERFERENCE REJECTION IN A DIRECT-SEQUENCE SPREAD-SPECTRUM RECEIVER.** The impact of imperfect synchronization on the performance of prediction-error interference rejection filters in noncoherent direct-sequence (DS) spread-spectrum communications is considered. Bit-error-rate (BER) analysis of binary DPSK (differential phase-shift keying) data modulation used in conjunction with direct-sequence spread-spectrum is used as a performance measure. A first-order noncoherent delay-lock loop is used for the pseudonoise (PN) code tracking. Conditional BER results for the DS/DPSK systems for fixed values of the code tracking error are obtained. The average BER of the system is then evaluated by averaging the conditional BER expressions over the probability density function of the code tracking error. Results include the effects of both a single fading tone and a narrowband Gaussian interferer on the overall system performance. Interferer offset frequency is considered in determining the code tracking loop noise as well as the receiver BER. 18 refs.

Goldberg, Steven H. (Univ of California, Santa Barbara, CA, USA); Iltis, Ronald A. *IEEE Trans Commun* v 36 n 4 Apr 1988 p 420-429.

**088190 MODULATABLE ORTHOGONAL SEQUENCES AND THEIR APPLICATION TO SSMA SYSTEMS.** A set of N-1 orthogonal sequences of period  $N^2$  is proposed, where N is a natural number. Each orthogonal sequence proposed can be modulated by N complex numbers of absolute value 1, so the modulated sequence is also orthogonal. When N is an odd prime number, the absolute value of the cross-correlation function between any two of the N-1 orthogonal sequences is constant and satisfies the mathematical lower bound. This property of the cross-correlation function is not changed when each of the two orthogonal sequences is modulated by N complex numbers of absolute value 1.

Two spread-spectrum multiple-access (SSMA) systems using these sequences are proposed. One system is an asynchronous SSMA system, using the proposed sequences unmodulated. The cochannel interference peak between any two channels in this system realizes the mathematical lower bound for an asynchronous SSMA system using a set of orthogonal sequences. The other system is a synchronous SSMA system without cochannel interference which uses the modulated form of the proposed sequences. 5 refs.

**088191 PERFORMANCE OF A CLASS OF PARALLEL SPREAD-SPECTRUM CODE ACQUISITION SCHEMES IN THE PRESENCE OF DATA MODULATION.** An acquisition procedure for data-modulated direct-sequence spread-spectrum systems is investigated. The correlation time is partitioned into subintervals, and the integration results in these subintervals are noncoherently combined for detection. The tradeoff between noncoherent combining loss and data modulation degradation guides the optimum choice of the number of subintervals. Two forms of data modulation are considered, namely, the alternate-data and random-data cases. The parallel acquisition schemes discussed allow multiple code-phase offsets to be examined at each test. The circular state diagram approach is used to analyze the performances of these schemes. The theory presented is valid for a class of such parallel schemes. 15 refs.

Cheng, Unjeng (JPL, Pasadena, CA, USA). *IEEE Trans Commun* v 36 n 5 May 1988 p 596-604.

**088192 PACKET ERROR PROBABILITIES IN FREQUENCY-HOPPED SPREAD-SPECTRUM PACKET RATIO NETWORKS - MEMORYLESS FREQUENCY-HOPPING PATTERNS CONSIDERED.** The packet error probability induced in a frequency-hopped spread-spectrum packet radio network is computed. The frequency spectrum is divided into q frequency bins. Each packet is exactly one codeword from an (M,L) Reed-Solomon code [M = number of codeword symbols (bytes); L = number of information symbols (bytes)]. Every user in the network sends each of the M bytes of his packet at a frequency chosen among the q frequencies with equal probability and independently of the frequencies chosen for other bytes (i.e., memoryless frequency-hopping patterns). Statistically independent frequency-hopping patterns correspond to different users in the network. Provided that K users have simultaneously transmitted their packets on the channel and a receiver has locked on to one of these K packets, the probability that this packet is not decoded correctly is evaluated. It is also shown that although memoryless frequency-hopping patterns are utilized, the byte errors at the receiver are not statistically independent; instead they exhibit a Markovian structure. 6 refs.

**088193 RAPID CODE ACQUISITION ALGORITHMS EMPLOYING PN MATCHED FILTERS.** The performance of four algorithms using pseudonoise matched filters (PNMFs), for direct-sequence spread-spectrum systems, is analyzed. They are: parallel search with fix dwell detector (PL-FDD), parallel search with sequential detector (PL-SD), parallel-serial search with fix dwell detector (PS-FDD), and parallel-serial search with sequential detector (PS-SD). The operation characteristic for each detector and the mean acquisition time for each algorithm are derived. All the algorithms are studied in conjunction with the noncoherent integration technique, which enables the system to operate in the presence of data modulation. Several previous proposals using PNMf are seen as special cases of the present algorithms. 26 refs.

## Testing

**088195 EXPERIMENTAL STUDY OF PROPAGATION CHARACTERISTICS ON ROADS ON A SNOWY MOUNTAIN.** Experimental results of radio propagation characteristics on roads on snowy or snow-capped mountains are discussed. Propagation tests were carried out on the horizontal and vertical polarization characteristics in a frequency range from VHF to X-band. Field strengths along the road and field distributions in the cross section were measured. The attenuation constants in a straight-road section were obtained by the least-squares method using measured data. It is shown that the attenuation constants are experimentally minimum in a frequency range of 1-3 GHz for each polarization, and that field strengths in the cross section are close to cosine distribution in the horizontal direction, and in the vertical direction, increase nearly monotonically with increasing elevation. 8 refs.

## United Kingdom

**088196 TOWARDS THE INTELLIGENT RADIO.** The author reports on RDS - the vhf Radio Data System and its implementation in the UK. The vhf Radio Data System described in this article is the product of the international working group which was set up by the EBU and in which the BBC was an active participant. The development and experimental period spanned the years 1974-1982, and several countries participated in the work. The objective was to develop a system which would be rugged enough to provide a viable service under all practical reception conditions, but would be compatible with the millions of receivers which already existed in the hands of the public to the extent of not generating any audible interference. Experimental transmissions over the last decade have proved the viability of the chosen system. 3 refs.

Shute, Simon (BBC). *Electron Wireless World* v 93 n 1620 Oct 1987 p 1023-1026.

**RADIO TRANSMITTERS** See Also ANTENNAS, DIRECTIVE—Directional Patterns; GEOPHYSICS—Electromagnetic; MODELS—Remote Control; RADIO BROADCASTING—United States; RADIO INTERFERENCE—Jamming; RADIO SYSTEMS, MOBILE; RADIO TRANSMISSION—Propagation in Ionosphere; TELECOMMUNICATION LINKS, SATELLITE.

**088197 MATERIAL TRACKING USING NON-DEDICATED TRANSMITTERS.** The use of existing high-power radar, television, or radio transmitters as nondedicated interrogators for medium and long-range tracking or identification systems may be applicable to monitoring nuclear material during transport or storage. The basis of this type system is that some character of the transmitter signal, such as modulation or timing, may be used to selectively actuate a remote transponder to transmit a single or coded pulse burst so that a base

station, receiving both the interrogation and response, could locate or identify the transponder. Although such a system severely constrains the designer by removing control of the interrogator frequency, coding, or operating status, the costs and complexities of design, construction, licensing, and operation of a high-power transmitter are also eliminated. Illustrative systems employing commercial radio and television signals are briefly discussed, and a detailed description is provided of a long-search radar in a non-dedicated mode to track small boats with transponders cooperatively or covertly placed. Design procedures and range projections for this system are presented along with some preliminary results obtained with reduced transmitter power. (Author abstract)

**Components** See Also AMPLIFIERS, POWER TYPE—Design.

**088198 SAW STABILIZED MONOLITHIC PULSE AMPLITUDE MODULATED MICROTRANSMITTER.** A low-power SAW-stabilized monolithic micro-transmitter has been developed. This device replaces all of the RF circuitry in a low-cost transmitter, such as these used in wireless security systems, and makes it possible to meet FCC specifications without costly design iterations. The oscillator in the transmitter is controlled by a third-generator SAW resonator that eliminates the need for impedance-matching or phase-shifting networks in the signal feedback path. This type of resonator made the monolithic transmitter design possible. The theory of operation, system architecture, and performance are presented.

## Efficiency

**088199 IMPROVED HIGH EFFICIENCY 500 KILOWATT SHORT WAVE BROADCAST TRANSMITTER WITH NOVEL FEATURES.** Some of the changes in international broadcaster's HF (high-frequency) transmitter needs are addressed, along with some adaptations in HF transmitter design to reflect those needs. The authors identify three fundamental changes in the emphasis of international broadcast transmitter requirements: due to increasing energy costs, more emphasis has been placed on equipment power efficiency; due to increasing labor costs, more attention is being paid to automation and ease of maintenance, i.e., manpower efficiency; and, third, because of spectrum crowding, improved spectral occupancy has become a concern, particularly with respect to transmitted signal purity, and spectral-efficient modulation modes. Several developments designed to meet these needs of broadcasters are described. The issue of power efficiency has been met with improved transmitter RF and modulator circuits. RF efficiency has been improved in part by lowering losses in RF output coupling circuits. This improvement is afforded by better network design, and better automatic tuning, i.e., tuning for best efficiency. More efficient RF output tubes have also been developed recently.

## Evaluation

**088200 EVALUATION OF 500 kW SHORTWAVE TRANSMITTERS AT THE VOICE OF AMERICA.** The Voice of America (VOA) has initiated a major program to modernize and expand its worldwide broadcast system. The program includes the procurement of 500-kW shortwave transmitters both for new stations and as replacements for aging and less efficient equipment in existing facilities. To develop and verify a specification for

new transmitters, four currently available 500-kW transmitters were purchased from separate vendors for evaluation at the VOA facility in Greenville, North Carolina. The intent of this off-the-shelf approach was to ensure a proper level of technical rigor in the specification without unduly restricting competition among suppliers. The evaluation focused on a variety of factors including installation, performance, operability, and maintainability. The procedures followed during the evaluation are described and some of the salient findings are presented.

Berman, Gerald A. (Voice of America, Washington, DC, USA); Garlington, Thomas R. *IEEE Trans Broadcast* v 34 n 2 Jun 1988 p 147-153.

## Modulation

**088201 MERITS OF MODERN TECHNOLOGY FOR TODAY'S HIGH POWER SHORT-WAVE TRANSMITTERS.** Recent developments of high-power shortwave transmitters are described, and practical experience with such transmitters is reported. Topics discussed are: high-level anode modulation, the pulse step modulator (PSM), the switching module, control of the PSM, the RF driver and final stage, and other modulation techniques. 13 refs.

**RADIOACTIVATION ANALYSIS** See Also CHEMICAL ANALYSIS—Activation; NEUTRONS—Sources.

**088203 OPTIMIZATION OF MULTIELEMENT GAMMA ACTIVATION ANALYSIS.** It is important and urgent to study the experience gained in applying the computational approach in order to develop methods for optimizing multielement  $\gamma$  activation analysis (GAA). In this work such a study is carried out based on the results of a comparison of computed and measured, in optimal regimes of  $\gamma$  spectra, activity induced by bremsstrahlung from electron accelerators in standard samples of igneous traprock (ST-1A standard). The regimes of activation and recording were calculated using the OPTIMUM program, developed in accordance with an optimization algorithm. The efficiency of the mathematical model was confirmed in previous experiments. 14 refs.

**088204 NEUTRON-ACTIVATION MEASUREMENTS IN INTENSE FIELDS OF REACTOR RADIATION.** The authors touch on the main aspects of standardization of neutron-activation measurements in intense reactor fields, indicate methods for development standardization of neutron-activation measurement means, and give practical recommendations for experi-

ment design. Standardized neutron-activation measurement means are being serially produced, the required nuclear-physics reference data are being systematized, and procedures for measurements and result processing are being developed. Reference data are presented that allow the necessary calculations for planning neutron-activation measurements to be performed. The principal quantity for preparation of neutron-activation detectors is the mass  $m$  of the nuclide target in the detector. The procedure for calculating this quantity is discussed. 4 refs.

**088205 RADIOACTIVATION MONITORING OF LOCAL SURFACE DAMAGE.** The processes causing surface damage on objects are complex and dissimilar. Apart from a uniform removal of an entire surface, one often observes local damage; scoring, discoloration, fretting corrosion, and erosion, knife-line corrosion and pitting, cavitation, etc. Monitoring the formation and development of cavities and pits is important for diagnosing the state of a component or a unit, for averting in due time a decrease in efficiency or failure of equipment, and for investigation of the damage mechanism and the development of measures for increasing the stability of materials. This article discusses radioactivation monitoring techniques applied to local surface damage. 16 refs.

## Optimization

**088206 OPTIMIZING ROUTINE MULTIELEMENT ACTIVATION ANALYSIS.** Various nuclear-physics methods are used in analyzing materials, which are based on reactions produced by neutrons, high-energy photons, protons, deuterons, and alpha particles. These methods provide high sensitivity, accuracy, and rapidity. Various reactions may occur on irradiation, particularly in fast-neutron and high-energy gamma-ray activation. The authors examine existing and proposed criteria for optimizing gamma spectrometry, which have been used in optimal methods for routine multielement analysis of soils and plants by means of 14 MeV neutrons. Optimizing an activation-analysis method amounts to examining a function (optimization criterion) dependent on controlled parameters. The reliability and accuracy are very much dependent on the criterion and on the processing methods. 4 refs.

## Absorption

**088207 RADIONUCLIDE SORPTION METHODOLOGIES FOR PERFORMANCE ASSESSMENTS OF HIGH-LEVEL NUCLEAR WASTE REPOSITORIES: A PERSPECTIVE GAINED FROM AN NRC WORKSHOP.** A workshop to discuss the characterization and modeling of radionuclide sorption processes in rock-water systems relevant to the isolation of high-level nuclear waste in geologic repositories was held May 13-15 1986, by U.S. Nuclear Regulatory Commission staff and contractors. The key recommendations of the workshop were that (1) a limited understanding of sorption phenomena will be needed to demonstrate reasonable assurance of compliance with regulatory repository-performance requirements; (2) understanding of sorption phenomena must be developed through laboratory studies complemented by field studies and consideration of natural analogs; (3) both site-specific and more fundamental laboratory studies designed to elucidate sorption mechanisms will be necessary components of a successful sorption program; (4) methods of modeling sorption that are more sophisticated than the single-value  $K_D$  model will be needed to support repository-performance assess-

ments; and (5) the level of sophistication of sorption models will depend on the radionuclide(s) of interest, available supporting laboratory data, and the level of isolation performance assigned to sorption processes. (Author abstract) 50 refs.

## Adsorption

**088208 ADSORPTION OF NATURAL RADIONUCLIDES ON PYROLUSITE.** Analysis of Ra, Th, and Po in water samples and low active effluents from a U mining and milling complex generally involves pre-concentration of samples carried out by co-precipitation or by evaporation. This paper describes an alternative method by way of adsorption of these radionuclides on pyrolusite pebbles in a column and their subsequent elution with dilute  $HNO_3$ . Ninety-three to 99% Ra, 80 to 87% Po, and 90 to 98% Th could be separated into 300 mL of acid solution from water samples of the order of 10 to 20 L. The method is found to be inexpensive and more convenient than other methods, without sacrificing the efficiency of extraction. (Author abstract) 5 refs.

## Analysis

**088209 SPONTANEOUS FISSION HALF-LIFE OF  $^{249}Cf$ .** The spontaneous fission half-life of  $^{249}Cf$ , which was calculated on the basis of the mass and the composition of the sample material, the exposure time, the recording efficiency, and the number of recorded fission tracks, is  $T_{s,f} = (8.5 \pm 0.5) \cdot 10^{10}$  years after averaging the results of the measurements made with two types of dielectric detectors. The ratio of the probabilities of  $^{249}Cf$  decay by  $\alpha$ -particle emission and spontaneous fission was calculated from the ratio of the intensities of  $\alpha$  decay and spontaneous fission:  $P_{\alpha}/P_{s,f} = T_{s,f}/T_{\alpha} = 2 (2.32 \pm 0.17) \cdot 10^8$ . 7 refs.

## Applications

**088210 OPERATION OF AN INDUSTRIAL RADIATION PROCESSING FACILITY IN MEXICO.** A 10 year old JS-6500 industrial Cobalt 60 irradiator was installed in 1980 at the ININ Nuclear Center in Mexico with 960 kGy. The facility was commissioned with some minor changes with respect to the original AECL design, in order to give services to different industries and also to do research in several fields. During 1981-1984 the demand increased but never reached more than 50% of the capacity. At present, there are 34 different companies irradiating 48 different products. Even those within the same grouping require different minimum and maximum radiation doses, so the facility has been operated by combining products and volumes. The experiences are presented in this paper. Also, maintenance of the irradiator is discussed and some modifications to the original programme have been done due to the necessity to use local spare parts instead of imported ones. (Edited author abstract) 1 ref.

Torres, Gilberto C. (Inst Nacional de Investigaciones Nucleares, Mexico City, Mex). *Radiat Phys Chem* v 31 n 1-3, Progr in Radiat Process, Proc of the 6th Int Meet, Ottawa, Ont, Can, May 31-Jun 5 1987 p 281-291.

**088211 PROGRESS IN GAMMA PROCESSING OF COMMERCIAL PRODUCTS.** A survey of gamma radiation processing worldwide is presented. It is estimated that 30 to 40% of the world's medical disposable products are radiation sterilized. Food irradiation, on the other hand, is in the embryonic stage of its development but is showing great promise. Emerging applications for radiation processing in the cosmetics and pharmaceutical industries, as well as in sewage sludge and materials

processing, are currently being assessed. Today, cobalt 60 production capacity has increased by a factor of 4 to in excess of 50 million curies per annum. This capacity should be doubled in the next five to ten years. The United States leads the world in the use of industrial irradiators. However, in the rest of the world the markets are constantly increasing. The Far East has moved into second place, replacing the European market now in third place.

## Chemical Analysis

**088212 ANALYSIS OF TISSUE SAMPLES CONTAINING COLLOIDAL THORIUM DIOXIDE (THOROTRAST) OR ZIRCONIUM DIOXIDE (ZIRCONOTRAST): RADIOCHEMICAL PREPARATION AND ALPHA-SPECTROMETRY.** The aim of the present study is to assess the activity of the thorium isotopes, Th-232, Th-230, and Th-228 in tissue samples containing Thorotrast or Radiozirconotrust, i.e. Th-230 and Th-228 enriched Zirconotrust, in order to enable calculations of tissue doses. A procedure was developed for radiochemical processing of these samples, and a computerized alpha-spectroscopy system has been constructed for routine activity measurements. The procedure developed for sample preparation permitted complete radiochemical processing of the above tissue samples. With regard to the great number of samples to be measured and the expected counting times of more than 1500 min, a computerized alpha-spectroscopy system with a sample conveyor has been constructed. (Edited author abstract) 7 refs.

**088213 THREE-DIMENSIONAL GROUNDWATER FLOW AND ADVECTION DIFFUSION CODE FOR TREATING DECAY CHAIN OF RADIOACTIVE MATERIALS BY FINITE ELEMENT METHOD.** A code - PER8MIGR - based on finite element method, and incorporating an 8-node isoparametric elements has been developed for solving in 3-dimensional treatment the groundwater flow and advection diffusion equations involving the decay chain of radioactive substances. Galerkin's method is applied to discretize the permeability and advection diffusion equations, and linear matrix equations are solved by band matrix method. The Code is verified for applicability by agreement seen in benchmark tests for groundwater flow in which comparisons are made of the results obtained using the code with those of one- and three-dimensional analyses and with HYDROCOIN Level-1 Case-1 solution, and also in tests for nuclide, migration with the results obtained using other codes-AT123D, SWIFT, F.E.M. code of LBL and MIG3D in INTRACON test. The present work should permit accurate estimation of the flow and diffusion behavior to be expected of high- and low-level radioactive wastes in geological formation of complex geometry. **Environmental Testing**

**088215 SEQUENTIAL ANALYTICAL METHOD FOR THE DETERMINATION OF U-238, Th-232, Th-230, Th-228, Ra-228 AND Ra-226 IN ENVIRONMENTAL SAMPLES.** Uranium and thorium isotopes are initially separated using tri-n-octyl phosphine oxide (TOPO) supported on a column of silica gel. The uranium isotopes are determined by alpha-spectrometry following extraction with TOPO onto a polymeric membrane. Thorium isotopes are coprecipitated with lanthanum fluoride before counting in an alpha spectrometer. Radium isotopes are separated by coprecipitation with mixed barium and lead sulphate. Radium-226 is determined with the radon emanation technique on a solution of the mixed barium and lead sulphates in ethylene-diamine tetra-acetic acid. Radium-228 is measured by its daughter product <sup>228</sup>Ac in a 2  $\pi\beta\gamma$  coincidence counter. (Edited author abstract) 7 refs.

**088218 MULTI-LEVEL ATTRIBUTES SAMPLING SCHEMES FOR MATERIAL ACCOUNTANCY VERIFICATION.** In order to verify the declared material accountancy values of a facility, a safeguards authority such as the International Atomic Energy Agency makes its own independent measurements of the contents of items in the material balance on a sampling basis. Because of advances in non-destructive assay technology, a number of alternative measurement methods may be available to make such verification measurements, each with its own level of accuracy and required measurement effort. It is shown how an arbitrary number of such techniques can be combined in an attributes sampling scheme that will guarantee a given probability of detecting a missing goal quantity. (Author abstract) 8 refs.

Sanborn, Jonathan B. (Brookhaven Nat'l Lab, Upton, NY, USA). *Nucl Mater Manage* v 16 n 1 Oct 1987 p 16-19.

**088219 IMPORTANCE OF UNDERSTANDING PROCESS HOLDUP - A DEPARTMENT OF ENERGY (DOE) VIEW.** Residual material in processing equipment is today and will in the future continue to be one of the major problems in controlling and accounting for nuclear material. Existing facilities were designed for product quantity, quality, and safety; not for minimization and quantification of residual material in process. With the development of measurement systems, and with enhanced material control and accounting practices and procedures, inventory differences have been emphasized. The improvement in processing input and output measurements has highlighted the problems of quantifying residual process material. The primary purpose for quantifying material held up in process is to determine the inventory difference and its related uncertainties or statistical variances. This quantification and its associated problems must be addressed if we are to prevent, deter, and detect theft and/or diversion of nuclear materials. (Author abstract). 1 Ref.

Hammond, Glenn A. (US DOE, Washington, DC, USA); Hawkins, Ron L. *Nucl Mater Manage* v 26 n 4 Jul 1988 p 12-14.

**088220 PROCESS HOLDUP - THE REGULATORY VIEW.** Performance-oriented safeguards regulations reflecting the different strategic value of special nuclear material were recently published as final rules. These rules have a significant impact on the requirements for holdup calculations and measurements. For licensees processing low enriched uranium, it is expected that few, if any, holdup measurements will be made for safeguards purposes. However, for licensees processing high enriched uranium or plutonium, the new regulations require extensive analysis of holdup measurements and estimations in modeling process flows, holdup, and yields for individual unit processes. Good quality holdup measurements and estimations will be required for both physical inventory and process monitoring purposes. (Author abstract). 4 Refs.

Brach, E. William (US Nuclear Regulatory Commission, Washington, DC, USA). *Nucl Mater Manage* v 26 n 4 Jul 1988 p 15-17.

**088221 HOLDUP - RELATED ISSUES IN SAFEGUARDING OF NUCLEAR MATERIALS.** Residual inventories of special nuclear materials (SNM) remaining in processing facilities (holdup) are recognized as an insidious problem for both safety and safeguards. This paper identifies some of the issues that are of concern to the safeguards community at-large that are related to holdup of SNM in large-scale process equipment. These issues range from basic technologies of SNM production to changing regulatory requirements to meet the needs of safeguarding nuclear materials. Although there are no

magic formulas to resolve these issues, there are several initiatives that could be taken in areas of facility design, plant operation, personnel training, SNM monitoring, and regulatory guidelines to minimize the problems of holdup and thereby improve both safety and safeguards at nuclear material processing plants. (Author abstract). 8 Refs.

Pillay, K.K.S. (Los Alamos Nat'l Lab, Los Alamos, NM, USA). *Nucl Mater Manage* v 26 n 4 Jul 1988 p 18-20.

**088222 OVERVIEW OF HOLDUP MEASUREMENT TECHNOLOGY.** 'Holdup' refers to special nuclear material (SNM) unintentionally deposited in or on process equipment or plant structure. Holdup arises through imperfections in the manufacturing process, accidents or failures of equipment, and deficiencies in plant and process equipment design. The origin of holdup, where it occurs in plants, and the methods of assay thus far found useful under conditions often found in nuclear fuel manufacturing installations are discussed. 3 Refs.

Zucker, Martin S. (Brookhaven Nat'l Lab, Upton, NY, USA). *Nucl Mater Manage* v 26 n 4 Jul 1988 p 21-25.

**088223 NUMATH: A NUCLEAR MATERIAL HOLDUP ESTIMATOR.** NUMATH is a computer program which provides near-real-time estimations of material compositions and inventories from previous inventory measurements, operating data, and available on-line process measurements - in a manner that is transparent to the computer terminal operator. In steady-state simulated-run testing, NUMATH produced estimates within 10% of the measured inventories for accountable materials. (Author abstract). 3 Refs.

**088224 INMM 28TH ANNUAL MEETING: 'SAFEGUARDS - A MATURE TECHNOLOGY?'** This conference proceedings contains 158 papers, all of which are separately indexed and abstracted. The papers consider topics in nuclear material management. Safeguard techniques are discussed in detail. Materials accountability and control systems are reviewed. Many papers are devoted to physical protection problems, including insider threats, as well as threat avoidance. Radioactive waste transport is also considered. Containment and surveillance, including security systems equipment, video systems, and video authentication, are also presented. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10542 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon (Inst of Nuclear Materials Management). *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 776p.

**088225 SOME DEVELOPED PERFORMANCE CRITERIA.** This paper describes proposed performance criteria for weapons, test devices, and significant special nuclear material (SNM) parts. The criteria were developed from material control, accountability, and physical security measures. Guidelines discussed in this paper represent a first effort in developing a useful set of Department of Energy material control and accountability (MC&A) performance standards for weapon parts production facilities. (Author abstract)

**088226 HOW ATTRACTIVE IS YOUR SNM?** The goal of a well designed safeguards system is the proper protection of various categories of Special Nuclear Material (SNM). In the past the quantity of SNM was the primary concern when defining categories. The form of the SNM is also important in a safeguards system. To a

diverter of material pure metal, for example, could be much more attractive than a nitrate solution. The design of a universal attractiveness table along with performance criteria for the safeguards system is a very complex problem. Several approaches to a solution will be discussed. (Author abstract) 2 refs.

Erkkila, Bruce H. (Los Alamos Natl Lab, Los Alamos, NM, USA). *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 776p.

**088227 PERFORMANCE CRITERIA FOR CATEGORIES III AND IV NUCLEAR MATERIALS.** DOE policy requires that DOE facilities protect and control the use of nuclear materials in such a manner that national security, program continuity and the health and safety of the public are not adversely impacted. Current implementation of this policy is based largely on compliance to specified requirements. Such requirements have not addressed site-specific situations and do not provide a means to quantify how well an integrated safeguards system is achieving policy objectives. The proposed performance criteria for Categories III and IV nuclear materials which are in the early stages of development address the potential impact on public health and safety of the use of these quantities of materials. These criteria attempt to provide more clear and consistent guidance regarding graded protection than do the current orders. Details of the proposed criteria are presented from the standpoint of a laboratory facility rather than a production facility. (Author abstract)

**088228 PERFORMANCE CRITERIA - PERSONNEL DUTIES AND TRAINING.** Performance criteria require that a facility handling nuclear material be capable with some degree of probability to detect the theft or diversion of material within a given time interval. Compliance criteria are established for the minimum requirements in materials accounting. These criteria require levels of excellence from both the monitoring system and the personnel involved in the acquisition and interpretation of input data and response alarms. The duties and training expected of personnel operating in a safeguards organization are discussed. (Author abstract)

**088229 SYSTEMS ANALYSIS FOR MATERIALS CONTROL AND ACCOUNTANCY TECHNOLOGY.** The objective is to upgrade Materials Control and Accountancy (MC&A) technology over the flows of special nuclear materials throughout the DOE complex of fuel cycles. The program focus is to develop a 'Management Tool' for decision support in evaluating MC&A upgrades, and in validating the MC&A aspects of the Master Safeguards and Security Agreements (MSSA) effectiveness. The approach is the computerization of the nuclear materials flow charts, identification of key measurement locations in the production and product fuel cycle, and construct data information processing at each measurement location. The program is to provide the Office of Safeguards and Security (OSS) with a timely management decision support system in planning MC&A safeguards technology upgrades over the nuclear materials production and product cycles. (Author abstract)

Daly, T.A. (Argonne Natl Lab, Argonne, IL, USA); Bucher, R.G.; Rothman, A.B.; Charak, I.; Persiani, P.J. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 221-224.

**088230 WHERE DO THE NUCLEAR MATERIALS MANAGEMENT FUNCTIONS FIT IN THE MATERIALS CONTROL AND ACCOUNTABILITY**

(MC&A) PLAN? Nuclear Materials Management activities have reporting requirements that include (1) Annual Forecast, (2) Materials Management Plan, (3) Quarterly Status Report, (4) Assessment Report, and (5) Scrap and Excess Material Management. Data used to generate reports for both functions come from the same data base and source documents at most facilities. The separation of sponsoring groups at the DOE for NM Accountability and NM Management can and does pose problems for contractors. In this paper, we will try to separate and identify these overlaps at the Facility and DOE level. (Edited author abstract)

De Ver, E.A. (Los Alamos Natl Lab, Los Alamos, NM, USA). *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 225-227.

**088231 NUCLEAR MATERIALS CONTROL AND ACCOUNTABILITY INTERNAL AUDIT PROGRAM AT THE OAK RIDGE Y-12 PLANT.** The internal audit program of the Nuclear Material Control and Accountability (NMC&A) Department at the Oak Ridge Y-12 Plant, through inventory-verification audits, inventory-observation audits, procedure audits, and records audits, evaluates the adequacy of material accounting and control systems and procedures throughout the Plant; appraises and verifies the accuracy and reliability of accountability records and reports; assures the consistent application of generally accepted accounting principles in accounting for nuclear materials; assures compliance with the Department of Energy (DOE) and NMC&A procedures and requirements. The internal audit program has significantly strengthened the control and accountability of nuclear materials through improving the system of internal control over nuclear materials. (Edited author abstract) 1 ref.

**088232 INVENTORY DIFFERENCES: AN EVALUATION METHODOLOGY.** This paper discusses an evaluation methodology which is used for inventory differences at the Los Alamos National Laboratory. It is recognized that there are various methods which can be, and are being, used to evaluate process inventory differences at DOE facilities. The purpose of this paper is to share thoughts on the subject and techniques with those who are responsible for the evaluation of inventory differences at their facility. The authors feel that one of the most dangerous aspects of any evaluation technique, especially one as complex as most inventory difference evaluations tend to be, is to fail to look at the tools being used as indicators. There is a tendency to look at the results of an evaluation by one technique as an absolute. At the Los Alamos National Laboratory, several tools are used and the final evaluation is based on a combination of the observed results of a many-faceted evaluation. The tools used and some examples will be presented.

**088233 SYSTEM TO FULLY AUTOMATE SPECIAL NUCLEAR MATERIALS ACCOUNTABILITY REPORTING FOR ELECTRIC UTILITIES.** The USNRC requires each licensee who is authorized to possess Special Nuclear Materials (SNM) to prepare and submit reports concerning SNM received, produced, possessed, transferred, consumed, disposed of, or lost. Yankee Atomic is developing an IBM PC-based computer code that fully automates the process of generating SNM accountability reports. The program, called SNMSP II, prints a number of summaries including facsimiles of the NRC/DOE-741, 742, 742C, and RW-859 reports in a format that can be submitted directly to the NRC/DOE. This paper discusses the major features of the code and

describes its implementation at Yankee. (Edited author abstract)

Pareto, Vittorio (Yankee Atomic Electric Co, Framingham, MA, USA); Venegas, Ramon. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 243-245.

**088234 NUCLEAR MATERIALS MANAGEMENT AND SAFEGUARDS SYSTEM (NMMSS).** This paper describes the Nuclear Materials Management and Safeguards (NMMSS) which is sponsored by the Department of Energy and the Nuclear Regulatory Commission. The system serves national security and program management interests, and international interests in the programs for the peaceful application of nuclear energy and nonproliferation of nuclear weapons. Within the scope applied and controlled under United States law and related International agreements, are US private nuclear industrial activities. In addition, its national and international scope enables it to provide service to other organizations such as the Arms Control and Disarmament Agency, the Department of State, and the US Congress. (Author abstract)

Baird, Patricia W. (Martin Marietta Energy Systems Inc, Oak Ridge, TN, USA); Jacobsen, Sharon E.; Matthews, William B. III; Pedigo, Roberta B. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 283-285.

**088235 EMERGENCY INVENTORY SYSTEM AT THE OAK RIDGE Y-12 PLANT.** A portable, computerized system for taking an emergency inventory of special nuclear materials (SNM) is in operation at the Oak Ridge Y-12 Plant. It is identified as the EIS (Emergency Inventory System). The components of the EIS are easily transported to any area of the plant where an inventory might have to be taken. The easy-to-use, menu-driven programming for the system is written in a widely used database management language that is standardized and easily upgraded. This paper discusses the development, operation, hardware, and software of the EIS. (Edited author abstract) 1 ref.

Smith, S.E. (Martin Marietta Energy Systems Inc, Oak Ridge, TN, USA). *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 290-292.

**088236 CONCEPT OF AN INTEGRATED QUALITY RECORD NUCLEAR MATERIAL ACCOUNTANCY SYSTEM.** RBU had already started in 1976 with the computerization of its nuclear material accountancy system. It used the hardware and the software which were at hand at that time. The development of the software needed about 3 years, and so, the system was fully introduced in 1979 and has been used since then with only minor changes. But with time, the overwhelming progress in computer and software technology has overcome the existing system. Upgrading the old system would need a lot of effort, so RBU decided to modernize its system fundamentally. The paper will describe the main changes between the present and the future systems. (Edited author abstract)

von Wachtendonk, Hans Juergen (Reaktor-Brennelement Union, Hanau, West Ger). *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 333-334.

**088237 DESIGN METHODOLOGY FOR MATERIALS CONTROL AND ACCOUNTING INFORMATION SYSTEMS.** Modern approaches to nuclear materials safeguards have significantly increased the data processing needs of safeguards information systems. Implementing these approaches will require developing efficient, cost-effective designs. Guided by database design research, we are developing a design methodology for

distributed materials control and accounting (MC&A) information systems. The methodology considers four design parameters: network topology, allocation of data to nodes, high-level global processing strategy, and local file structures to optimize system performance. Characteristics of system performance that are optimized are response time for an operation, timeliness of data, validity of data, and reliability. The ultimate goal of the research is to develop a comprehensive computerized design tool specifically tailored to the design of MC&A systems. (Author abstract) 6 refs.

Helman, P. (Univ of New Mexico, Albuquerque, NM, USA); Strittmatter, R.B. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 345-351.

**088238 U.S. DEPARTMENT OF ENERGY INTERNATIONAL SAFEGUARDS PROGRAM - CONTAINMENT AND SURVEILLANCE ACTIVITIES.** Material accounting is currently the fundamental element of International Safeguards as applied by the International Atomic Energy Agency (IAEA), with Containment and Surveillance (C/S) serving an important complementary role. Because of limited IAEA resources and the increasing number of nuclear facilities, it is commonly recognized that increased reliance may have to be placed on C/S equipment. For more than a decade, C/S has been an important element of the DOE International Safeguards Program, with Sandia National Laboratories serving as the 'Center of Excellence' for the DOE C/S activities. These activities are divided into three major categories - C/S-based Safeguards Design and Strategies, C/S Technology Development, and Technology Exchange. This paper describes the objective of each of these activities, the principle accomplishments, the current activities and planned future activities. (Author abstract) 10 refs.

Myers, D.A. (US DOE, Washington, DC, USA); Mangan, D.L.; Sonnier, C.S. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 380-382.

**088239 SIMULATION MODEL FOR MATERIAL ACCOUNTING SYSTEMS.** A general-purpose model that was developed to simulate the operation of a chemical processing facility for nuclear materials has been extended to describe material measurement and accounting procedures as well. The model now provides descriptors for material balance areas, a large class of measurement instrument types and their associated measurement errors for various classes of materials, the measurement instruments themselves with their individual calibration schedules, and material balance closures. Delayed receipt of measurement results (as for off-line analytical chemistry assay), with interim use of a provisional measurement value, can be accurately represented. (Edited author abstract) 1 ref.

Coulter, C.A. (Los Alamos Natl Lab, Los Alamos, NM, USA); Thomas, K.E. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 478-482.

**088240 VARIANCE AND COVARIANCE CALCULATIONS FOR NUCLEAR MATERIALS ACCOUNTING USING 'MAVARIC'.** Determination of the detection sensitivity of a materials accounting system to the loss of special nuclear material (SNM) requires (1) obtaining a relation for the variance of the materials balance by propagation of the instrument errors for the measured quantities that appear in the materials balance equation and (2) substituting measured values and their error standard deviations into this relation and calculating the variance of the materials balance. MAVARIC (Materials Accounting VARIance Calculations) is a custom spreadsheet, designed using the second release of Lotus 1-2-3, that significantly reduces the effort required to make the necessary variance (and covariance) calculations needed to determine the detection sensitivity of a materials accounting system. (Edited author abstract) 2 refs.

Nasser, K.K. (Los Alamos Natl Lab, Los Alamos, NM, USA). *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 489-493.

**088241 VARIANCE CALCULATIONS FOR MATERIALS ACCOUNTING SYSTEM DESIGN AND EVALUATION.** Error propagation/variance calculations are used for establishing alarm limits for materials balance closures. Variance calculations may also be employed in the evaluation of accounting system designs for a proposed facility, as well as for upgrades of existing facilities. Information from such an exercise may be used to allocate resources for system improvements and identify process areas that require strict access or material controls. Simplifying assumptions are normally required since detailed data are not available for proposed facilities and may be difficult to obtain for existing facilities. Transfer, inventory, and measurement data are input into a code that calculates the variance for each term in the materials balance equation. Provision should be made for treatment of measurement correlations and holdup. (Edited author abstract) 1 ref.

**088242 NEW BRUNSWICK LABORATORY SAFEGUARDS MEASUREMENT EVALUATION PROGRAM.** The New Brunswick Laboratory (NBL) has been tasked by the US Department of Energy (DOE) Office of Safeguards and Security (OSS) to assess and evaluate the adequacy of measurement technology as applied to materials accounting in DOE nuclear facilities. Phase I of the Safeguards Measurement Evaluation Program, initiated during 1985, involved evaluation of the primary accountability measurement methods at six DOE Defense Programs facilities: Savannah River Plant, Portsmouth Gaseous Diffusion Plant, Y-12 Plant, Rocky Flats Plant, Rockwell Hanford Operations, and NBL. Samples of uranyl nitrate solution, dried plutonium nitrates, and plutonium oxides were shipped to the participants for assay and isotopic abundance measurements. Resulting data are presented and evaluated as indicators of current state-of-the-practice accountability measurement methodology, deficiencies in materials accounting practices, and areas for possible assistance in upgrading measurement capabilities. (Edited author abstract) 1 ref.

**088243 OSE INSPECTION OF MATERIALS CONTROL AND ACCOUNTABILITY: REVIEW.** As part of its task to confirm that Department of Energy (DOE) field offices provide levels of security and safeguards commensurate with defined threats, the DOE Office of Security Evaluations (OSE) conducts inspections of the nuclear materials control and accountability (MC&A) systems at DOE facilities throughout the United States. Inspections are based on the DOE Safeguards and Security Standards and Criteria, tailored to the specific assets at and threats to each individual site. This paper reviews the process of inspecting MC&A systems during the planning, preinspection, and inspection/reporting phases. (Author abstract)

Coady, Kelly J. (US DOE, Washington, DC, USA). *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 531-534.

**088244 OSE INSPECTION OF MATERIALS CONTROL AND ACCOUNTABILITY: FIELD PERSPECTIVE OF INSPECTIONS.** The Inspection and Evaluation (I&E) process for materials control and accountability (MC&A) is discussed from the perspective of an 'inspector'. Methods of preparing for a visit by the I&E team and the operational and budget impacts of the I&E Standards and Criteria are briefly discussed. The I&E

process does not have to be traumatic, but it can be if the inspectors are not properly prepared and if ground rules and procedures have not been established. This paper presents the author's views and reflects his perspectives of the Office of Security Evaluations (OSE) MC&A process. In preparation for this paper, the author has talked at length with his peers and has included some of their perceptions of the I&E process. However, this paper is the sole responsibility of the author and does not constitute an official position of the Los Alamos National Laboratory or of any other entity. (Author abstract)

**088245 INDEPENDENT FISSILE INVENTORY VERIFICATION IN A LARGE TANK EMPLOYING LUTETIUM DOUBLE SPIKES.** A 3000-liter feed adjustment tank containing over 2400 L of uranium solution was assayed for its contents using the double spiking technique of isotope dilution mass spectrometry. Lutetium was the double spike, with the natural element used as the initial spike and enriched <sup>176</sup>-Lu as the second. The ability of a remote sampling system was evaluated for its ability to introduce the lutetium and also to produce homogeneous sample solutions. The system was found to be satisfactory. Volumes of the tank can be measured to a precision of about 0.2%. The concentration of uranium was measured as 154.5 g/L uranium, thus giving a total of 382.3 kg in the tank as compared to the plant's best estimate of 383 kg. Uranium measurements were subjected to internal calibration calculations, with <sup>233</sup>-U and <sup>236</sup>-U being used as the reference isotope. (Edited author abstract) 4 refs.

**088247 RADIOCAESIUM ON URBAN SURFACES IN WEST CUMBRIA FIVE MONTHS AFTER CHERNOBYL.** Following the accident at the Chernobyl nuclear power plant on April 26, 1986, heavy rainfall in early May led to the deposition of radiocaesium on urban and ground surfaces in parts of west Cumbria, UK. Measurements in the following September showed that most common urban constructional materials had intercepted and retained significant fractions of the radiocaesium incident on surfaces. In some cases, as much as two-thirds was retained. Although the amounts found in this survey present no significant radiation hazard, the high retention figures on some materials do indicate the limitations of weathering as a decontamination mecha-

nism and highlight the need for forced decontamination methods to be considered in nuclear accident contingency planning. 1 ref.

## Production

**088249 APPLICATION OF ATOMIC MUTATIONS INCLUDED IN NUCLEAR REACTIONS,  $^{40}\text{Ar}(\gamma, p)^{39}\text{Cl}(\beta \text{ DECAY})^{39}\text{Ar}$ , TO SURFACE STUDY.** It has been found that the nuclear transformation processes which are initiated by photonuclear reactions can be used for studying the adsorption and chemical reactions taking place on solid surfaces. Chemically reactive  $^{39}\text{Cl}$  was produced by irradiating  $^{40}\text{Ar}$  with high-energy bremsstrahlung, and its blow was directed onto several material surfaces. The amount of chlorine absorption was ascertained by detecting its radioactivity. Desorption without heating the adsorber samples inevitably occurred owing to the nuclear decay of  $^{39}\text{Cl}$ . The adsorption and desorption rates were compared for several elements. A fast growth of oxide islands on sample surfaces was observed during the adsorption-desorption process. (Author abstract) 7 refs.

**088251 CERENKOV GLOW OBSERVATIONS FROM SPENT FUEL.** The observation of Cerenkov glow from a fuel assembly is an attractive method of detecting the presence of radioactive material. The simple, hand-held instrumentation is very easy to use and does not require penetration of the water in the spent fuel pool. An obstacle to routine use of the instrument arises in that the standard night vision devices have a broad band wavelength response which required the pool area to be darkened. Various techniques used to limit the bandwidth of the devices for use in viewing the Cerenkov glow in the presence of facility illumination have furthered implemen-

tation. A properly specified, commercially available instrument has been used to make narrow band observations at two power reactors without interference from the facility illumination. (Edited author abstract) 10 refs.

## Sampling

**088254 PHYSICO-CHEMICAL SPECIATION OF AIRBORNE  $^{131}\text{I}$  IN JAPAN FROM CHERNOBYL.** The physicochemical form of airborne  $^{131}\text{I}$ , released during the Chernobyl accident, was investigated in Japan during the period 6 to 19 May 1986. The proportions of  $^{131}\text{I}$  species identified during that period were: 19% particulate iodine, 5%  $\text{I}_2$ , 6% HOI and 70% organic iodides. These results are similar to those obtained in previous studies of airborne stable iodine in inland regions. A fraction of  $^{131}\text{I}$  which was adsorbed on particulate matter desorbed from it during the sampling process. (Author abstract) 11 refs.

**088255 MC-10 PWR SPENT-FUEL STORAGE CASK: TESTING AND ANALYSIS.** Successful testing confirmed that the Westinghouse MC-10 spent-fuel storage cask offers utilities a technically sound and practical way to meet the growing need for additional on-site storage. Moreover, in predicting the cask's thermal performance, the COBRA-SFS computer code, now being evaluated at the Pacific Northwest Laboratory, achieved good agreement with actual test data. The COBRA-SFS code performed well in predicting the shapes of the temperature profiles and the actual temperatures, with pre- and posttest results coming within 30°C of data. The agreement between predictions and measurements improved slightly in the posttest analysis, which corrected for a basket-to-inner-wall gap and for input errors. In shielding performance, the cask met design expectations, except that the bottom will require minor design modifications. (Edited author abstract)

## Thermodynamics

**088256 EQUILIBRIUM MEASUREMENTS AS A SOURCE OF ENTROPIES AND MOLECULAR CONSTANT INFORMATION.** The absolute entropies of a number of high temperature gaseous molecules with uncertain molecular constant assignments were derived from equilibrium measurements with accuracies of 1 to 2 cal·K<sup>-1</sup>·mol<sup>-1</sup>. These results were derived from measurement of reaction equilibrium constants over wide temperature ranges by application of second law analysis. The results give clear indications about the magnitudes of electronic level contributions of the lower-valent uranium and thorium halides, the symmetries and geometric structures of uranium and thorium tetrahalides, and about the low frequency vibrations of some M<sub>2</sub>SO<sub>4</sub> metal sulfate species. The general usefulness of this approach is discussed. (Author abstract) 18 refs.

**088257 PREPARATION OF LABELLED  $^{38}\text{Cl}$  HYDROCARBONS BY RECOIL  $^{38}\text{Cl}$  ATOM REACTION AND DETECTION BY RADIO-GAS CHROMATOGRAPHIC TECHNIQUES.** A radio-gas chromatographic technique had been applied for the quantitative determination of the radioactive labeled  $^{38}\text{Cl}$  compounds obtained from the recoil  $^{38}\text{Cl}$  atom reaction with C<sub>2</sub>H<sub>4</sub>. Argon gas was added to the system as neutron flux monitor to calibrate the total radioactivity of  $^{38}\text{Cl}$  produced. I<sub>2</sub> and HI were added as a scavenger to remove the thermal radicals produced. The yields of radioactivity of CF<sub>2</sub>Cl<sup>38</sup>Cl and C<sub>2</sub>H<sub>5</sub><sup>38</sup>Cl depended on the initial mole fraction ratio of CF<sub>2</sub>Cl<sub>2</sub>/C<sub>2</sub>H<sub>4</sub>. The major product found was C<sub>2</sub>H<sub>5</sub><sup>38</sup>Cl (> 90%) when HI was added as scavenger. In the other system CF<sub>3</sub>Cl/C<sub>2</sub>H<sub>4</sub>/I<sub>2</sub> we studied the yields of inorganic and organic compounds labeled with  $^{38}\text{Cl}$ . The yield of H<sup>38</sup>Cl as a function of the mole ratio of CF<sub>3</sub>Cl/C<sub>2</sub>H<sub>4</sub> is shown. (Author abstract) 10 refs.

**088260 SYNTHESIS OF  $[^{11}\text{C}]$  IODOMETHYLCYCLOPROPANE, AN INTERESTING ALKYLATING REAGENT.** The synthesis of  $[^{11}\text{C}]$  iodomethylcyclopropane by a four-step procedure, starting from  $[^{11}\text{C}]$  carbon dioxide, is presented. The  $[^{11}\text{C}]$  carbon dioxide was trapped in a solution of cyclopropylmagnesium bromide and the acid was reduced to give the alcoholate. When treated with p-toluenesulfonyl bromide,  $[^{11}\text{C}]$  bromomethylcyclopropane was formed directly and then converted to the corresponding iodide by the Finkelstein reaction.  $[^{11}\text{C}]$  iodomethylcyclopropane was prepared in about 13% radiochemical yield (decay-corrected) and 80% radiochemical purity, with a reaction time of 20 min and a specific radioactivity in the order of 10-100 mCi/ $\mu\text{mol}$ . (Author abstract) 13 refs.

**088262 DEUTERIUM AND TRITIUM LABELING OF (3-XYNYL)CYCLOHEXANE BY CLEMMENSEN AND WOLFF-KISHNER REDUCTION.** Tritium-labeling of (3-xylyl)cyclohexane was investigated by deuterium-labeling on Clemmensen and Wolff-Kishner reduction of 2-3-xylylcyclohexane. Deuterium-labeling by the Clemmensen reduction was proved to be accompanied by isotope exchange via acid-catalyzed enolization of the carbonyl group. Thus, the labeled (3-xylyl)cyclohexane was a mixture of compounds with various numbers of deuterium atoms. Labeling by the modified Wolff-Kishner reduction gave a mixture of compounds labeled predominantly at position 2. (Author abstract) 9 refs.

## Transportation

**088265 BEFOERDERUNG RADIOAKTIVER STOFFE IN DER EG.** [Shipments of Radioactive Substances in the EC]. In the early eighties the European Communities, initially the Transport Directorate General and later the Energy Directorate General, saw the need to discuss shipments of radioactive substances within the EC countries, especially under some aspects of the nuclear fuel cycle. Under all conditions, smooth transport had to be ensured, e.g., from a nuclear power plant to a reprocessing plant. The Energy Directorate General of the European Communities therefore established a group of experts in 1982 who were to deal with problems associated with shipments of radioactive substances. One of their first major activities was the drafting of a report to the European Parliament in which the situation of shipments of radioactive substances within the EC was examined. The results of that report are outlined in the article. (Author abstract) In German.

**088266 FORUM: SHIPMENT OF SPENT NUCLEAR FUEL FROM AUSTRALIA.** The Federal Government has agreed to ship spent nuclear fuel elements from Australia for reprocessing. This article gives the background to this operation which though unusual for Australia is a normal part of the international transport system. (Edited author abstract)

Coleby, D. *Nucl Spectrum* v 2 n 1 Mar 1986 p 8-12.

**088267 REVISION DER IAE-EMPFEHLUNGEN UND IHRE UMSETZUNG.** [Revised IAEA Recommendations and their Implementation]. Transports of radioactive materials are carried out on the basis of the recommendations made by the International Atomic Energy Agency (IAEA) about safe transports of radioactive materials (Safety Series No. 6). Transports of other dangerous goods are organized on the basis of United Nations (UN) recommendations (Orange Book). The IAEA recommendations were published in an amended version in 1985. The article contains an explanation of the way in which international transport organizations incorporate the 1985 version of the recommendations into internationally valid transport codes, such as ADR, RID, ADN, IATA-DGR, ICAO-TI, and the IMDG Code. (Author abstract) In German.

76-79.

**088268 BASE TECHNOLOGY DEVELOPMENT ENHANCES STATE-OF-THE-ART IN MEETING PERFORMANCE REQUIREMENTS.** Sandia National Laboratories (SNL) has responsibility to the United States Department of Energy (DOE) for baseline technology to support the design of radioactive material transportation packages. To fulfill this responsibility, SNL works with industry, government agencies, and national laboratories to identify and develop state-of-the-art technology required to design and test safe, cost-effective radioactive materials packages. Principal elements of the base technology program include: 1) analysis techniques, 2) testing, 3) subsystem and component development, 4) packaging systems development support, and 5) technical support for policy development. (Author abstract)

Freedman, J.M. (Sandia Natl Lab, Albuquerque, NM, USA); Allen, G.C. Jr.; Luna, R.E. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 263-265.

**088269 PUBLIC CONCERNS ABOUT RADIOACTIVE MATERIAL TRANSPORTATION CAN BE REDUCED BY EFFECTIVE COMMUNICATION OF ENGINEERING DATA.** This paper presents information concerning the safety of transporting radioactive materials (RAM). This evaluation is supported by an examination of data for actual accidents and incidents that have occurred with RAM transport, a study of the regulatory test procedures used to certify RAM packagings and the comparison of RAM transport with that of other hazardous materials. A number of studies are summarized that show that RAM transportation has been a low risk operation for approximately four decades. (Edited author abstract) 10 refs.

McClure, James D. (Sandia Natl Lab, Albuquerque, NM, USA); Luna, Robert E. *Nucl Mater Manage* v 16 1987, INMM 28th Annu Meet: 'Safeguards - A Mature Technol?', Newport Beach, CA, USA, Jul 12-15 1987 p 266-271.

**088270 CULTIVATING TRANSPORTATION RELATIONSHIPS: THE COMMUNICATIONS ENIGMA.** Transportation, a critical component of the Nuclear Industry's total mission, is an area where problems exist, especially as it relates to rail transportation. Cooperation between the Nuclear Industry and the Transportation Carrier Community is being negatively impacted by flaws in effective communication, which, if improved, can provide great benefits to both parties. This paper addresses the level of understanding which exists today, the areas which are especially troublesome and must be overcome, why it is important to the Nuclear Industry to make this effort, and, finally, the causes and suggested solutions for taking corrective action. The paper is not intended to answer all aspects of what is required, but rather provide a starting point of understanding from which to develop future programs. (Author abstract)

**088271 TROUBLESOME TRANSPORTATION CONCERNS CAN BE MITIGATED - RADMAT TRACKING SYSTEM.** There are three troublesome institutional concerns which face every large-quantity radioactive materials shipment - routing, prenotification, and emergency response. DOE is developing a transportation tracking system, based on a rapidly developing technology to determine geographical location using geopositioning satellite systems. This technology will be used to track unclassified radioactive materials shipments in real-time. It puts those charged with monitoring transportation status on top of every shipment. Besides its practical benefits in the areas of logistics planning and

execution, it demonstrates emergency preparedness has indeed been considered and close monitoring is possible. This paper will describe the system's technical detail, DOE plans and policy for its implementation, and the state of satellite positioning technology. (Edited author abstract)

**088272 PACKAGING AND TRANSPORTATION OF RADIOACTIVE MATERIALS (PATRAM '86), PROCEEDINGS OF AN INTERNATIONAL SYMPOSIUM.** This conference proceedings contains 159 papers which concern the packaging and transportation of radioactive materials. 9 papers are in French, one in Spanish, one in Russian. The rest are in English. The contributions span a broad range of topics which include policy, technical details, transport experiences, and administrative issues. Design of packaging systems for radioactive wastes is given ample coverage. Analysis and testing techniques of containers are reviewed. Cask materials are also discussed. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11074 in the Ei Engineering Meetings (TM) database produced by Engineering Information Inc.

**Waste Disposal** See Also RADIOACTIVE WASTES—Management.

**088273 UPDATED SCALING FACTORS IN LOW-LEVEL RADWASTE.** NRC regulations require utilities to list the quantities of several difficult-to-measure radionuclides in all low-level radioactive waste shipped to land disposal facilities. This research, verifying and extending conclusions reported earlier, proposes generic scaling factors to ease the utilities' financial burden for off-site analyses. Fifty-two plants participated in the study, adding two years of data to NP-4037 and bringing the number of off-site analyses in the EPRI 10 CFR 61 database to about 1300. This report, which substantiates the generic scaling factors first proposed in NP-4037, presents scaling factors for quantifying nickel-63 and iron-55, as related to cobalt-60 concentrations in BWR and PWR waste streams. Additionally, the report identifies plutonium-239 as the key isotope for determining other transuranic concentrations. (Edited author abstract)

Anon. *Electr Power Res Inst Rep EPRI NP* 5077 Mar 1987 156p.

**088274 METHODOLOGY FOR CALCULATING COMBUSTIBLE GAS CONCENTRATION IN RADWASTE CONTAINERS.** An NRC-approved procedure is now available for calculating hydrogen concentrations in sealed nuclear waste containers. Implemented on computer spreadsheets, the procedure is faster and less costly than the tests and measurements originally prescribed for predicting combustible gas generation. The calculated hydrogen concentrations were within an average of 20% of the concentrations measured prior to venting and shipment of the TMI-2 casks. On the basis of these results, the NRC agreed to accept model calculations as confirmation that low-level waste packages meet regulations governing combustible gas mixtures. (Edited author abstract)

Anon. *Electr Power Res Inst Rep EPRI NP* 4938 Mar 1987 116p.

**088275 DESIGNS AND COSTS OF LOW-LEVEL WASTE DISPOSAL FACILITIES.** To help utilities, EPRI is developing alternative designs for low-level radioactive waste disposal facilities. This report provides detailed conceptual designs for different disposal technologies, along with cost estimates for each alternative design

and projected worker exposure rates based on the quantity and radiologic nature of waste packages received for disposal. Development efforts resulted in designs for six LLRW disposal technologies: buried placement (trenches), covered structure, buried structure, buried modules, collocated covered modules and buried structure, and deep structure (mined cavity). Total cost estimates indicated that buried placement was the least expensive and deep structure the most expensive of the alternatives. (Edited author abstract)

Anon. *Electr Power Res Inst Rep EPRI NP* 5365 Aug 1987 2p.

**088276 FILTRATION IMPROVEMENT STUDY AT THREE MILE ISLAND UNIT 2.** Reduced water clarity impaired visibility in the reactor vessel at Three Mile Island Unit 2, interfering with defueling operations. This research, cosponsored by General Public Utility Nuclear Corporation, determined that a combination of two cationic polymers and diatomaceous earth could improve the ability of existing filtration equipment to maintain water clarity. Colloidal materials in the reactor coolant led to plugging of the porous metal screens. When used alone, commercially available filtering materials do not adequately prevent penetration of extremely fine particulates. Two coagulant aids composed of cationic organic polymers did destabilize the colloids. However, the use of polymers in combination with diatomaceous earth provided interparticle bridging, resulting in dramatic improvement in the filterability of the coolant as well as extremely high effluent clarity. (Edited author abstract)

Anon. *Electr Power Res Inst Rep EPRI NP* 5367 Oct 1987 112p.

**088277 ADVANCED RADIOACTIVE WASTE AS-SAY METHODS.** Nuclear power plants face increased restrictions in the classification of radioactive waste material, which can result in increased disposal costs. Two techniques identified in this study should improve accuracy in waste radioactivity measurements, thereby reducing handling and burial costs while keeping personnel radiation exposure as low as reasonably achievable. This study found that gamma-ray spectroscopy used with a neutron counting technique will improve analytic accuracy at reasonable cost while fulfilling ALARA requirements. For easy-to-sample wastes such as homogeneous evaporator bottoms or small volumes of mixed resin, comparisons between direct assay results and sampling results showed excellent agreement: 20%. (Edited author abstract)

Anon. *Electr Power Res Inst Rep EPRI NP* 5497 Nov 1987 288p.

**088278 LA GESTION A LONG TERME DES DECHETS RADIOACTIFS.** [Long-Term Management of Radioactive Waste]. After setting out the terms of reference of ANDRA (national agency for the management of radioactive waste), the author describes the current situation and the projects for the surface storage of waste of low and medium activity. He then discusses the work which has started on the construction of an underground laboratory for studying the storage of long life waste. (Author abstract). In French.

Faussat, Armand. *Rev Gen Nucl* n 1 Jan-Feb 1988 p 51-52.

**088279 SYSTEMS ENGINEERING IN NRC'S HIGH LEVEL WASTE PROGRAM.** In order to fulfill its statutory responsibilities in the national program for high level nuclear waste disposal, the Nuclear Regulatory Commission (NRC) has adopted a systems engineering approach. This paper discusses that approach, and its expected contributions to the overall NRC program. The paper covers 3 subjects: (1) Why NRC has adopted a systems engineering approach to fulfill its regulatory role in the national High-Level Waste (HLW) program, especially in repository licensing; (2) The current status of NRC's program and what it is designed to do; and (3) What NRC foresees as the benefits of a successful effort

in terms of safety, timeliness, and cost-effectiveness.

**088281 EVALUATING THE DURABILITY OF A SIMULATED NUCLEAR WASTE GLASS: A STATISTICAL APPROACH.** Multicomponent systems tests of the durability of fuel recycle waste glass are an important tool to assess the long-term performance of a nuclear waste isolation system. A fractional factorial design was chosen for these tests, with three parameters: the cation exchange capacity of clay, the ionic strength of groundwater, and the concentration of clay in groundwater. The dissolution behavior of a simulated nuclear waste form based on sodium borosilicate glass was investigated at these three levels. (Edited author abstract). 66 Refs.

## Accident Prevention

**088282 RIGID PERFORMANCE REQUIREMENTS ASSURE PUBLIC SAFETY BY REGULATIONS.** Title 10, Part 71 of the Code of Federal Regulations (10 CFR 71) provides a set of prescriptive performance test requirements for spent nuclear fuel and high-level waste transport packaging containment systems. The hypothetical accident conditions, which involve a sequence of impact, puncture, fire, and water immersion events, are referred to as rigid because of their extremely prescriptive nature. These hypothetical accident events have now been placed within the context of real transportation accidents, at least for conventional austenitic stainless steel/lead gamma shielded cask designs. The assurance of public safety, including the issue of safety margin for very severe accident events, is discussed in this paper for both conventional and innovative cask design concepts. A particular risk assessment approach that follows from work at the Lawrence Livermore National Laboratory is suggested. (Author abstract) 6 refs.

## Adsorption

**088283 ADSORPTION - DESORPTION STUDIES ON THE RADIUM-SILICA SYSTEM.** Uranium is extracted from its ores by sulphuric acid or by alkaline carbonate leaching. The uranium mill tailings from these processes are mildly radioactive because they contain most of the radium-226 initially present in the ore, either as radium sulfate or as radium carbonate. Adsorption of radium-226 on quartz is investigated. Adsorption isotherms are obtained for crystalline and sulphuric and hydrochloric acid-treated quartz samples at pH 1 and 10. Desorption of radium-226 from silica with EDTA and an EDTA-KCl mixture is also studied. It is found that radium-226 adsorbed on silica is difficult to desorb whereas radium deposited on silica as radium sulphate is easily removed in EDTA solutions. (Edited author abstract) 15 refs.

## Analysis

**088284 DIE BESTIMMUNG VON PLUTONIUM IN ABFALLFASERN.** [Plutonium Assays in Waste Drums]. The events associated with the Transnuclear and Nukem nuclear fuel companies have revived the discussion about the methods, minimum quantities, accuracy and reliability of assaying for plutonium in waste drums. These problems are in no way new, but have always been of crucial importance in the work going on for a long time already for the development of methods of measurement for nuclear materials accountability and the determination of fissile material in alpha-bearing waste. Methods in which the drum is opened and the sample analyzed chemically are able to detect plutonium quantities in the submilligram range, but are too time consuming for routine application and raise problems in sampling heterogeneous waste. For this reason, those methods of measurement are preferred in which the radiation emitted by the sample is measured on the surface of the drum. (Edited author abstract) 15 refs. In German.

Kuehle, M. (Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, West Ger); Ottmar, H.; Wuerz, H. *Atomwirtschaft Atomtech* v 33 n 4 Apr 1988 p 181-184.

**088285 CHEMICAL CHARACTERIZATION, LEACH AND ADSORPTION STUDIES OF SOLIDIFIED LOW-LEVEL WASTES.** Laboratory and field leaching experiments were conducted on solidified low-level waste from a commercial boiling water reactor. Chemical and radionuclide analyses performed on samples collected from the field and laboratory experiments indicate strong adsorption of  $^{134,137}\text{Cs}$  and  $^{85}\text{Sr}$  onto the Hanford soil. Approximately 0.5% of the available  $^{60}\text{Co}$  leached from the waste forms and migrated through the soil with a retardation factor of 1. Chemical constituents present in the reactor waste streams and found at elevated levels in the field and laboratory leachates include: sodium (1383 mg/L), sulfate (2230 mg/L), and nitrate (435 mg/L field only). Plausible solid phases that could be controlling the chemical and radionuclide concentrations in the leachate were identified using the MINTEQ geochemical computer code. (Edited author abstract) 22 refs.

Walter, M.B. (Pacific Northwest Lab, Richland, WA, USA); Serne, R.J.; Johnstone, D.L.; Yonge, D.R. *Nucl Chem Waste Manage* v 8 n 1 1988 p 55-67.

## Calcination

**088286 OPERATING PERFORMANCE OF THE NEW WASTE CALCINING FACILITY.** Reprocessing nuclear fuels at the Idaho Chemical Processing Plant (ICPP) to recover the unspent fissile material results in the generation of significant quantities of radioactive liquid wastes. Handling, treatment, and storage of these wastes are areas that have received considerable attention from the entire nuclear industry. Although no decision concerning 'permanent' disposition of these wastes has yet been reached, a new facility built by the U.S. Department of Energy (DOE) at the ICPP near Idaho Falls, Idaho, is providing the capability to solidify the liquid wastes and safely store them in underground bins. This article discusses the facility and design requirements, remote requirements, and operating results.

Bingham, G.E. (Westinghouse Idaho Nuclear Co, Idaho Falls, ID, USA). *Energy Prog* v 8 n 2 Jun 1988 p 98-99.

## Computer Aided Analysis

**088287 WEST VALLEY UPGRADES ITS MULTI-COMPONENT ASSAY SYSTEM.** The experience gained in modifying, developing and automating the West Valley radwaste assay system is potentially applicable elsewhere. The type of radionuclides, size of waste package, and density and form of the waste determine which of West Valley's four major assay subsystems is used. The four subsystems together form a comprehensive automated assay system. Using personal computers, the

full system automatically stores assay data; maintains inventories; streamlines recordkeeping; negates the need for duplicative, time-consuming data entry; automatically produces, manifests and generates reports; and performs statistical and mathematical analyses, data reduction, and classification.

McVay, Charlie (West Valley Nuclear Services Co, West Valley, NY, USA); Hoffman, Dean. *Nucl Eng Int* v 33 n 403 Feb 1988 p 51-52.

## Decontamination

**088288 MELTING OF URANIUM-CONTAMINATED METAL CYLINDERS BY ELECTROSLAG REFINING.** Melt refining as a means of uranium decontamination of metallic wastes by electroslag refining was examined. Electroslag refining was selected because it is easy to scale up to the necessary industrial levels. Various thicknesses of iron and aluminum cylinders with uranium concentrations close to actual metallic wastes were melted by adding effective fluxes for decontamination. Thin-walled iron and aluminum cylinders with a fill ratio (electrode/mold cross-section ratio) of 0.05 could be melted, and the energy efficiency obtained was 16 to 25%. The ingot uranium concentration of the iron obtained was 0.01 to 0.015 ppm, which was close to the contamination level of the as-received specimen, while for aluminum it was 3 to 5 ppm, which was a few times higher than the as-received specimen contamination level of approximately 0.9 ppm. (Edited author abstract) 15 refs.

Uda, Tatsuhiko (Hitachi Ltd, Hitachi, Jpn); Ozawa, Yoshihiro; Iba, Hajime. *Nucl Technol* v 79 n 3 Dec 1987 p 328-337.

**088289 DESIGN AND TESTING OF NATURAL-BLENDED ZEOLITE ION EXCHANGE COLUMNS AT WEST VALLEY.** A zeolite ion exchange system has been designed and fabricated for decontaminating various radioactive liquid wastes being generated during the decommissioning activities at the former nuclear fuel reprocessing plant in West Valley, New York. Variables affecting the column design and performance were investigated in the laboratory. Results of testing showed that the removal of the radioactive contaminants is strongly dependent upon waste composition and residence time. The use of a zeolite bed containing both a natural zeolite (phillipsite) and a processed zeolite (Linde A-51) were found to successfully handle the waste streams. (Author abstract) 1 ref.

Burn, P. (West Valley Nuclear Services Co, West Valley, NY, USA); Ploetz, D.K.; Saha, A.K.; Grant, D.C.; Skriba, M.C. *AICHE Symp Ser* n 259 v 83, Rec Progr in Adsorpt and Ion Exch. Publ by AIChE, New York, NY, USA p 66-72.

**088290 RADIOACTIVE DECONTAMINATION OF WASTE OIL BY FILTRATION, CENTRIFUGATION, AND CHELATION.** Laboratory studies were conducted on select physical and chemical processes for decontamination of a composite waste lubricating oil from a boil water reactor. Physical treatments included successive filtration through 25.8 and 1  $\mu\text{m}$  filters to remove particulate matter and centrifugal to remove water. Chemical treatment consisted of mixing the oil with an aqueous solution of the chelating agent ethylenediaminetetraacetic acid (EDTA) and centrifuging the resulting emulsion. The effectiveness of the treatment processes was evaluated by measuring radionuclide concentrations in the oil following each treatment step and calculating decontamination factors. The total activity of the oil was dominated by  $^{60}\text{Co}$ ,  $^{54}\text{Mn}$ , and  $^{137}\text{Cs}$ , although  $^{51}\text{Cr}$ ,  $^{58}\text{Co}$ ,  $^{59}\text{Fe}$ , and  $^{134}\text{Cs}$  were also present. Filtration consistently achieved decontamination factors of approximately 200, 100, and 40 for  $^{137}\text{Cs}$ ,  $^{54}\text{Mn}$ , and  $^{60}\text{Co}$ , respectively, and reduced concentrations of the other radionuclides below their detection limits. The overall decontamination factor for successive filtration, centrifugation, and chelation was in excess of 10,000 for  $^{54}\text{Mn}$  and  $^{137}\text{Cs}$  and on the order of 1000 for  $^{60}\text{Co}$ . (Edited author abstract) 14 refs.

**088291 DEACTIVATION OF LOW-ACTIVITY EFFLUENTS FROM ATOMIC ELECTRIC POWER PLANTS BY SELECTIVE INORGANIC SORBENT.** Large amounts of liquid waste are produced during the operation of atomic electric power plants. One of the possible technological solutions which would simplify the processing of waste water is to use synthetic inorganic sorbents that are selective mainly with respect to radionuclides  $^{137}\text{Cs}$ ,  $^{134}\text{Cs}$ , and  $^{60}\text{Co}$ , which provide the basic contribution to the radioactivity of the effluent from atomic electric power plants. The present article provides the results of long-term stand tests of composite sorbents based on ferrocyanides of tetravalent metals, describes the design of an experimental decontamination device for industrial use, and provides a technical and economic substantiation of its application. Two sorbents were chosen for testing as a result of preliminary experiments: sorbents based on zirconium ferrocyanide (ZFC) and titanium ferrocyanide (TFC). 8 refs.

**088292 OCEAN DISPOSAL OF HIGH LEVEL RADIOACTIVE WASTE: MIGRATION PATHWAYS IN SOILS.** This work is an investigation of the effectiveness of sub-seabed sediments as a barrier to radionuclide migration, when the sediments are deformed by the passage of a penetrometer, by hydraulic fractures or by faulting. The effect on diffusion coefficients of the pressures and temperatures encountered below 5 km of water, is discussed. The experimental section consists of a description of the method used to produce autoradiographs of soil samples and to obtain the distribution coefficients of promethium and iodide between clays and seawater. These are followed by experiments to determine diffusion coefficients for the migration of iodide through clay samples. The last part of the section describes the scanning electron microscopy, which was used to investigate the orientation of clay particles around a rapidly emplaced model projectile. The results of the studies are reviewed in terms of the effect that the deformations are likely to have on the rate of transport of radionuclides to the seabed. (Edited author abstract) 36 refs.

**088293 STUDY OF THERMALLY INDUCED CONVECTION NEAR A HIGH-LEVEL NUCLEAR WASTE REPOSITORY IN PARTIALLY SATURATED FRACTURED TUFF.** We present simple estimates for velocities of buoyancy-driven flow of liquid and gas phases near a hypothetical high-level nuclear waste repository in partially saturated, fractured tuff. These estimates indicate that gas phase convection could take place with appreciable velocity, of the order of 20 m/year, while liquid convection is expected to be very slow, of the order of 0.1 mm/year. Detailed numerical simulations using an 'effective continuum' approximation to represent

fracture effects confirm these estimates and demonstrate a sensitivity of gas convection to the strength of binary diffusion. (Author abstract) 38 refs.

**088294 CENTRIFUGE AND LABORATORY TESTS, MODELLING THE PENETRATOR CONCEPT FOR THE DISPOSAL OF HGW IN DEEP OCEAN SEDIMENTS.** The report is a summary of the work carried out at Cambridge University Engineering Department to investigate the geotechnical aspects of the subseabed disposal of heat generating waste. The problem of heat transfer and coupled consolidation around a heat source was studied both experimentally and numerically. Calculations of the temperature and pore pressure changes in the soil around a cylindrical heat source were made and verified by both laboratory tests and by centrifuge modeling at 100 times earth's gravity. It was shown that conduction was the major heat transfer process. The high velocity penetration of soil by projectiles was modeled on the Cambridge Geotechnical Centrifuge and this was followed by centrifuge tests in which there was subsequent heating of the projectile after firing. These dynamic tests showed that the projectile produced high pore pressures within the soil, which were quickly dissipated. (Author abstract) 25 refs.

**088296 EMPIRICAL CORRELATIONS FROM WASTE GROUT FORMULATION DATA.** Data correlations have demonstrated systematic relationships between important variables in hydrofracture grout formulation. The data are taken from an investigation to determine conditions for eliminating drainable water from the grout system. The two most important variables affecting drainable water are the amounts of Attapulgit-150 clay in the dry-solids blends and the ratios in which the blends are mixed with the waste. Empirical equations were developed relating (a) volume percent of drainable water, (b) time for free water adsorption, (c) weight percent of clay, (d) dry-blend liquid-waste mix ratio, (e) compressive strength, (f) weight percent of fly ash, and (g) pumping flow rate required for turbulent flow through 51-mm-i.d. pipe. (Edited author abstract) 11 refs.

**088299 CHARACTERISTICS OF RADIOACTIVITY CONTAMINATION OF SOIL AT THE NEVADA TEST SITE.** For 35 years the Nevada Test Site Complex has been contaminated by a combination of transuranic elements, fission products, and activation products. Within the nuclear detonation sites the initial radionuclide distribution depended upon the different types of nuclear tests (airburst, surface, or underground) and meteorological conditions at the time of each test. Results of this study show that the present distribution is the result of wind and water erosion, whereas site specific geomorphic features and pedogenic processes played secondary roles. The high temperatures of the detonations resulted in most of the radionuclides being incorporated into fused soil and rock materials which have very low solubilities in aqueous media. The glassy silicate contaminants vary in size, but most (91%) are greater than 0.1 mm in diameter. Therefore, the radioactivity contributed by the respirable (<0.1 mm) and respirable (<0.005 mm) particles in the soils is less than 9% of the total soil radioactivity, indicating that the site has a very low potential to off-site environmental and health hazards under natural conditions. (Edited author abstract) 36 refs.

**088300 MODELING STUDY OF GEOCHEMICAL INTERACTIONS AT THE SHEFFIELD, ILLINOIS LOW-LEVEL RADIOACTIVE WASTE DISPOSAL SITE.** This report summarizes an attempt to model the geometrical behavior of leachate migration from the Sheffield, Illinois low-level radioactive waste disposal site. The reaction path code PHREEQE was used to simulate mixing between groundwater altered by trench leachate and ambient groundwater. The thermodynamic speciation code WATEQF was used to calculate the aqueous speciation and mineral saturation indices of the pertinent waters. The mass balance code BALANCE was used to predict the probable chemical reactions occurring as groundwater migrates. Results suggest that the most important factor influencing water quality is dilution. Chemical reactions that may also be affecting water chemistry are ion exchange, calcite precipitation, iron sulfide mineral dissolution, and exsolution of CO<sub>2</sub>. Limitations of the modeling include lack of consideration of reaction kinetics under surficial conditions, uncertainties in flowpaths, and limited reliability of thermodynamic data. The study suggests that anionic and gaseous radionuclides have the greatest potential for migration away from the site. (Author abstract) 17 refs.

**088301 EMANATION AND DISPERSAL OF TRITIATED WATER FROM DISPOSAL SHAFTS.** The source level of contamination induced by the presence of tritiated water (HTO) in the Banderier tuff near Los Alamos, New Mexico has been seen to decrease in all directions at the same time. This decrease in radioactivity with distance from the source has been measured around three different disposal shafts and found to be slower than the decrease in emanation rate with distance from the source. Physical factors, suspected of influencing HTO emanation, were entered as independent variables in a regression equation including measurements taken over a 14-month period. The physical variables studied were of thermal, hydrological, and meteorological origin. Only four variables were retained as significant. Air concentrations of HTO show a maximum during the warmer months and an overall minimum during the colder months. Emanation of HTO, shown to be strongly associated with daily heat flux amplitude, also at a maximum in summer and at noon, more than counterbalances higher dissipation due to increased turbulence occurring during the same period. (Edited author abstract) 9 refs.

**088306 TECHNOCRACY AND TRUST: NUCLEAR WASTE CONTROVERSY.** The Nuclear Waste Policy Act of 1982 requires the US Department of Energy (DOE) to develop a permanent nuclear waste repository. DOE is also required to conduct a program of consultation and cooperation with each of the effected states and Indian

Tribes. The program is characterized by a pervasive lack of trust that threatens to undermine the intent of the act. Rather than addressing the technical issues of nuclear waste disposal, this paper explores the issue of trust itself. The paper concludes that the crisis over nuclear waste cannot be resolved through technological solutions alone. The crisis involves the relationship of a citizenry to its institutions of power. To address such a crisis, the subject of trust itself and its requirements must be seriously examined. (Author abstract) 22 refs.

Bella, David A. (Oregon State Univ, Corvallis, OR, USA); Mosher, Charles D.; Calvo, Steven N. *J Prof Issues Eng v 114 n 1 Jan 1988 p 27-39.*

**088307 ESTABLISHING TRUST: NUCLEAR WASTE DISPOSAL.** The US effort to establish a permanent nuclear waste repository is threatened by a pervasive lack of trust that could undermine the entire program. Rather than examining the many technical debates involved, this paper addresses the pervasive and long-standing lack of trust. The subject of trust itself is explored. It is reasoned that the lack of trust is a function, not of the individuals involved, but of the decision-making process. An alternative process is presented. (Author abstract) 13 refs.

**088309 IMPACT OF D<sup>3</sup>He FUSION REACTORS ON WASTE DISPOSAL.** The suggestion that the surface of the moon may be mined for <sup>3</sup>He to be used as a fuel in terrestrial fusion reactors has recently been made. A fusion reactor based on the D<sup>3</sup>He reaction would have the advantage that most of the power produced would be in the form of charged non-radioactive particles. However, secondary D-D and D-T reactions also occur. A study is made of the consequences of the radioactivity induced by the neutrons from these reactions with respect to waste disposal. A generic first wall and shield 0.4 m thick consisting of 7% structure, 73% H<sub>2</sub>O and 20% void was used as a test case. (Edited author abstract) 11 refs.

**088310 TREATMENT AND DISPOSAL OF TRITIUM CONTAINING WASTE AT MOUND.** First generation fusion machines will burn the hydrogen isotopes deuterium and tritium as fuel. Tritium, which is radioactive, must be handled carefully and any byproducts must be disposed of as radioactive waste. Tritiated waste will fall into one of three categories: gaseous, liquid, or solid. Sources and expected quantities of tritiated waste that are likely to be generated by a fusion machine will be discussed. Strategies, options and processes for dealing with tritium containing wastes will also be presented. Final disposition of each category of tritium contaminated waste is governed by regulations and guidelines. These regulations and guidelines, and how they might apply to a fusion reactor facility, will be outlined. (Author abstract) 10 refs.

**088311 STABILITY EVALUATION FOR CEMENT PACKAGE CONTAINING RADIOACTIVE WASTE.** In order to provide stable cement packages, ettringite formation, a major cause of cement deterioration, was studied theoretically and experimentally. A computer program was developed to calculate the chemical equilibrium compositions of a complex cement system. Higher curing temperature and the addition of NaOH were identified as effective methods to avoid ettringite formation. These findings were confirmed by measuring the amount of ettringite in solidified cement by an X-ray diffraction method. (Author abstract) 17 refs.

**088312 APPLICATION OF THE FINITE ELEMENT GROUNDWATER MODEL FEWA TO A RADIOACTIVE WASTE DISPOSAL SITE.** A finite element model for water transport through porous media (FEWA) has been applied to the unconfined aquifer at the Oak Ridge National Laboratory Solid Waste Storage Area 6 Engineered Test Facility (ETF). The model was developed in 1983 as part of a shallow land burial technology research program and was previously verified using several general hydrologic problems for which an analytic solution exists. Model application and calibration, as described in this paper, consisted of modeling the ETF water table for three specialized cases: a one-dimensional steady-state simulation, a one-dimensional transient simulation, and a two-dimensional transient simulation. In the one-dimensional steady-state simulation, the FEWA output accurately predicted the water table during a long period in which there were no human-induced or natural perturbations to the system. The input parameters of most importance for this case were hydraulic conductivity and aquifer bottom elevation. (Edited author abstract) 11 refs.

**088313 NEPTUNIUM MIGRATION IN OXIDIZING CLAYEY SAND.** The rate and mechanism of Np migration were investigated in a flowing water/clayey sand system under oxidizing conditions. A <sup>237</sup>Np-doped borosilicate glass was used as a source of containment in the migration experiments. A preliminary study of the chemical speciation of Np in the water leachate allowed identification of soluble cationic and anionic carbonate species of Np(V). The formation constants of Np(V) carbonate complexes were corrected for the ionic strength of the groundwater by making use of the Guggenheim-Scatchard specific interaction theory. The values were then used to model the partitioning of Np between the soil and the water phase. Analytical solutions of the transport equation were used for best-fit analysis of the Np column profiles. Both the sorption reaction and the dissociation kinetics were considered in the model. (Edited author abstract) Refs.

**088314 PRAXIS DER RADIOAKTIVEN ABFALL-BEHANDLUNG IM ZWIELICHT.** [Suspicious About the Practice of Radioactive Waste Treatment]. Two quite distinct events associated with the treatment and disposal of radioactive waste have created a turmoil in the past twelve months. In the discussions about the Hanau nuclear fuel industries, the pressure buildup in conditioned waste drums, which had been known for two years and had meanwhile been investigated in various places, was mixed up with the irregularities at Transnuklear either out of ignorance or intentionally. In the public, this was bound to create the impression as if the ballooning of a large number of waste drums as a result of gas evolution were connected with the goings-on at Transnuklear. Actually, however, these are two absolutely separate issues. 1 ref. In German.

**088315 UNREGELMAESSIGKEITEN BEI DER DEKLARATION VON ABFALLFAESSERN DURCH TRANSNUKLEAR/SCK MOL.** [Irregularities in the Declaration of Waste Drums by Transnuklear/SCK Mol]. In mid-December 1987, the competent ministries in the Federal Republic of Germany received some first indications of irregularities said to have occurred in the conditioning of low level radioactive waste from German nuclear power plants at the Belgian nuclear research center, SCK Mol. The first statement referred to forty conditioned drums shipped back to the intermediate storage facility with the Unterweser Nuclear Power Station (KKU) in September 1983. A second statement then indicated that a total of 321 drums containing waste from the Belgian BR-3 test reactor had been shipped into the Federal Republic. Subsequent investigations revealed that intermediate storage facilities in the Federal Republic at present hold some 2500 drums whose contents were either conditioned or graded in Mol. A number of drums were examined at the Karlsruhe and Juelich Nuclear Research Centers. The findings made in these examinations, and the consequences to be drawn from them, are presented. (Author abstract) In German.

**088316 DRUCKAUFBAU UND BLAEHERSCHEINUNGEN AN 200-1-ABFALLFAESSERN.** [Pressure Buildup and Ballooning in 200 1 Waste Drums]. In addition to the generally known phenomenon of radiolytic gas evolution in cemented medium level radioactive waste, which mainly causes water from the cement matrix to be dissociated by radiation chemistry reactions producing hydrogen, there has recently been internal pressure buildup and ballooning as a consequence of gas evolution in a different kind of waste drums, namely drums filled with low level waste (LLW) compacted under high pressure. The results of investigations conducted to date are not yet sufficient to explain fully all processes going on in this waste. However, it has become clear what mixtures of substances are likely to create problems. (Author abstract) 2 refs. In German.

**088317 RADIOACTIVE WASTE MANAGEMENT: FACILITIES AND PLANNING IN SWEDEN.** As far as the nuclear fuel cycle is concerned, Sweden differs from other countries in that the twelve nuclear power plants of the country, with an aggregate installed capacity of roughly 10,000 MW meeting 50% of the electricity requirement, are compelled by law to discontinue operation by the year 2010. Svensk Kaernbraenslehantering AB (SKB), the Swedish nuclear fuel cycle company, thus faces a precisely defined waste management volume totaling some 7000 te of spent fuel elements to be put into long term intermediate storage. For this purpose, the central Swedish intermediate storage facility for spent fuel elements, CLAB, has been built near the Oskarshamn nuclear power station on the Simpevarp peninsula. In late 1987, more than 3200 spent fuel elements with some 650 te of fuel were stored in the water pool. The Swedish repository for radioactive waste is being driven into the rock below the water level near the site of the Forsmark nuclear power station, one kilometer from the coast. (Edited author abstract)

**088318 ASSESSMENT OF CARBON STEEL CONTAINERS FOR RADIOACTIVE WASTE DISPOSAL.** The report describes a study of the corrosion of high level nuclear waste containers in geological disposal. It has concentrated on the use of carbon steel in granitic environments and has aimed at estimating the corrosion allowance required to achieve a 1000-year life. Experi-

tal and mathematical modelling studies have indicated that 216 mm of steel should be more than sufficient to prevent penetration by general or localized corrosion. There are sound mechanistic reasons to regard this value as an overestimate. The possibility of stress corrosion cannot be dismissed but because the process requires a certain minimum stress level before it can occur, it should be possible to avoid the problem by giving the containers a stress relief heat treatment. A conservative assessment has shown that microbial corrosion may cause a maximum additional metal loss of 13 mm. (Author abstract) 39 refs.

Marsh, G.P. (Harwell Univ, Engl); Taylor, K.J. *Corros Sci* v 28 n 3 1988 p 289-320.

**088319 ELIMINATION OF COBALT IN NUCLEAR VALVES.** The attribute unique to cobalt-base, wear-resistant alloys that make them attractive for nuclear valve applications is their high resistance to galling and sliding wear. Studies at AMAX, supported by EPRI, have identified a family of iron-base alloys, designated NOREM, that show resistance to galling wear as high as the cobalt-base ones. Other iron-base alloys also performed very well in these laboratory tests. These alloys also possess other properties needed for hardfacing applications. Loop tests of gate valves that will be hardfaced with these alloys have been initiated, and a plant demonstration will be organized. The outstanding properties of the NOREM alloys and the expectation that they can be produced at lower cost than the cobalt-base ones has spurred interest by valve manufacturers, a number of whom will be undertaking in-house evaluations. In valves designed to control or throttle coolant flow, the use of cobalt-base hardfacing alloys appear to be unnecessary. Some stainless steels that performed well in operating plants were identified. 9 refs.

**088322 SCANNING AND HIGH-RESOLUTION AUGER ANALYSIS OF ZIRCONOLITE/PEROVSKITE SURFACES FOLLOWING HYDROTHERMAL TREATMENT.** Synroc is the generic term for waste forms based on assemblages of titanate minerals such as perovskite, zirconolite and hollandite. Two tita-

nate minerals, zirconolite with perovskite minor phase inclusions, have been subjected to hydrothermal chemical attack. The effects of the treatment have been investigated with scanning and high resolution Auger analysis. Both mineral surfaces act as substrates for carbonate precipitation. Dissolution was the main mechanism of attack of perovskite, followed by precipitation from solution and growth of TiO<sub>2</sub> on the phase regions. There was also precipitation of calcium as fluoride and phosphate and growth of these crystallites at random locations on the surface of the two-phase ensemble. The zirconolite phase regions were not affected by the hydrothermal treatment. (Edited author abstract) 15 refs.

**088325 VOLUMETRIC CHANGE OF SIMULATED RADIOACTIVE WASTE GLASSES IRRADIATED BY THE <sup>10</sup>B(n, α)<sup>7</sup>Li REACTION AS SIMULATION OF ACTINIDE IRRADIATION.** The density change of simulated radioactive waste glasses irradiated by the <sup>10</sup>B(n, α)<sup>7</sup>Li reaction was determined by a sink-float method as a function of irradiation exposure. Simulated waste glasses P0500, P0798 and GP98/12 swelled, while P0504 shrunk. The magnitude of the density change was less than 0.6% up to a fluence of 6.6 × 10<sup>25</sup> reactions/m<sup>2</sup>, which corresponds to the cumulative irradiation during a few tens of thousand years after disposal of the waste glass from the spent fuel irradiated up to 33000 MWD/MTU. The processes which play an important role on the density change have not been clarified, but it is likely that one of the processes is helium bubble formation which was clarified by a carbon replica technique, in association with transmission electron microscopy. (Author abstract) 13 refs.

**088326 CHEMICAL ASSOCIATIONS OF ARTIFICIAL RADIONUCLIDES IN CUMBRIAN SOILS.** The distributions of radionuclides in the surface layer of four soils of contrasting types from west Cumbria, UK, have been studied in detail. All the soils contain enhanced levels of artificial radionuclides derived from low-level discharges both to sea and to atmosphere from the British Nuclear Fuels reprocessing plant at Sellafield. The bulk of

the activity is held in the top 15 cm of soil profiles, suggesting that radionuclide mobility is limited. Sequential extraction experiments have identified major associations of plutonium with organic matter and of caesium with silicates but there is no preferential association of ruthenium with any single soil component. (Author abstract) 35 refs.

**088327 RADIOACTIVE WASTE MANAGEMENT IN THE UK.** In the UK, as in most industrialized countries, radioactive materials are used in the generation of electricity, and in industry, defence, medicine and research. There is a recognized need, reflected in government policy, to establish a permanent, safe disposal facility. Disposing of this waste is not an awesome task. Technically and logistically the problem is quite manageable. The greatest impediment to the establishment of a waste disposal facility is public perception of the risks associated with radioactive materials. For this reason, it is important to provide the public with full information on radioactive waste disposal, and to ensure that their concerns are fully discussed and understood.

McInerney, P.T. (UK Nirex Ltd). *Nucl Eng J Inst Nucl Eng* v 29 n 2 Mar-Apr 1988 p 34-36.

**088328 DISPOSAL R&D PROGRAMME OF UK NIREX LTD.** A review is presented of the large program of research and development specifically concerned with the long-term safety of radioactive waste disposal. This paper is concerned with the long-term safety of a repository deep underground or under the sea-bed, for which the Environment Departments are the regulating authorities. 4 Refs.

**088329 TECHNOLOGY AND ART OF NUCLEAR WASTE DISPOSAL.** The paper considers the issues and questions that face the public regarding nuclear waste management. It discusses the current method of nuclear waste management and the disposal methods that have been researched. It highlights key points in the Nuclear Waste Policy Act regarding technical criteria for geologic repository selection and requirements for public involvement in the selection process. The paper's theme encourages nuclear experts to develop the channels of communication with the public in an effort to fulfill the public's need to understand the issues. The history of the second nuclear waste repository project is provided for insight, and the agenda for the coming years is discussed. (Author abstract). 1 Ref.

**088330 CUBIC ZIRCONIA AS A CANDIDATE WASTE FORM FOR ACTINIDES: DISSOLUTION STUDIES.** Canada's radioactive waste management activities include research programmes pertaining to the immobilization of highly radioactive nuclear fuel waste in durable host materials. Zirconia stabilized with 10 mol percent Y<sub>2</sub>O<sub>3</sub> or 15 mol percent CaO appears to be attractive because of its ability to incorporate actinides and long-lived <sup>93</sup>Zr, present in the irradiated fuel sheath, into the crystal lattice of its cubic form. Leaching studies were performed on cubic zirconia stabilized with 9.4 mol percent Y<sub>2</sub>O<sub>3</sub>. The experiments described confirmed the high durability of cubic zirconia under the temperature and groundwater salinity conditions anticipated in a nuclear waste disposal vault. 28 Refs.

**088331 DIRECT-ASSAY CHARACTERIZATION OF IRRADIATED HARDWARE, APPLICATION TO FUEL SKELETONS.** Nuclear power plants are reaching the limits of their capacity to store spent fuel and it will be some time yet before the DOE facility will accept the fuel for disposal. Disposal of irradiated hardware at PWRs has been slow, however, since the bulk of PWR volume has been fuel assemblies composed both of fuel rods and the skeletons (cages). However, Northern States Power estimates that rod consolidation (removal of the fuel rods from the cages and repackaging them with closer packing) could reduce the volume required for stored fuel by a factor of two. Effective consolidation requires disposal of the skeletons. The current Consolidation Demonstration Program at Prairie Island consolidated 36 fuel assemblies and was concluded in the spring of 1988 with the disposal of all skeleton material that meets burial criteria. This article reports on the program. 4 Refs.

**088333 EXPERIENCE WITH RADIOACTIVE WASTE INCINERATION AT CHALK RIVER NUCLEAR LABORATORIES.** Chalk River Nuclear Laboratories is a Nuclear Research Centre operated by Atomic Energy of Canada Limited. A full-scale waste treatment center has been constructed to process low- and intermediate-level radioactive wastes generated on-site. A batch-loaded, two-stage, starved-air incinerator for solid combustible waste is one of the processes installed in this facility. This paper presents a review of the performance of the incinerator during its six years of operation. In addition to presenting operational experience, an assessment of the starved-air incineration technique will also be discussed. (Edited author abstract). 8 Refs.

**088334 OVERVIEW OF THE MANAGEMENT OF LOW-LEVEL RADIOACTIVE WASTES IN CANADA.** In Canada, the program for the management of low-level radioactive wastes is one of continued reliance on interim storage methods while putting in place the policies, regulations and technologies for the transition to permanent disposal which should begin early in the 1990s. The Canadian regulatory authority has issued a policy statement on the objectives, requirements and guidelines for the disposal of radioactive wastes and has proposed a basis for the identification of a de minimis category. This article presents an overview of low-level radioactive waste management in Canada, including regulations, waste processing, safety, and storage concepts. 21 Refs.

**088335 DEVELOPMENT AND ACTIVE DEMONSTRATION OF ACID DIGESTION OF PLUTONIUM-BEARING WASTE.** At the Eurochem site, 800 kg of combustible alpha waste containing about 7 kg of plutonium were treated from March 1983 to July 1985 with the aim of concentrating the plutonium by oxidizing the waste and converting it into a soluble form so that the established purification process could be applied. In a batch process, shredded waste is oxidized with nitric acid in sulfuric acid. The digester content is then kept for

several hours at digestion temperature to complete the dissolution of plutonium dioxide. The cold digester content is then filtered and the plutonium-containing filter cake is sent to the plutonium purification system. The off-gases generated are freed from the acids by scrubbing. The process is demonstrated in a plant with a daily throughput of 10 kg of waste. (Edited author abstract). 10 Refs.

**088336 SAFEGUARDS PROBLEMS AND POSSIBLE SOLUTIONS WITH DEEP UNDERGROUND DISPOSAL OF USED NUCLEAR FUEL AND FUEL RECYCLE WASTE.** The disposal of used, radioactive, nuclear fuel and nuclear fuel recycle waste, which is often more radioactive, has been one of the major undertakings of the nuclear industry in many countries. Technology must be developed and facilities must be built for safe long-term storage or disposal of this used fuel and fuel recycle waste. In Canada, the United States, Sweden, Germany and other States, research and development work has been in progress for several years to find a satisfactory solution to this important problem. This work on used fuel and fuel recycle waste disposal has included studies and tests on: suitable locations for disposal; techniques for safe containment and disposal; and health and safeguards aspects. In this paper we will consider the problems and possible techniques for the application of IAEA safeguards to the nuclear material at these disposal facilities. (Author abstract) 5 refs.

**088338 GEODE PROCESS ACHIEVES HIGH VOLUME REDUCTION.** A combined crystallization and cementation system for nuclear power plant wastes, called Geode<sup>®</sup>, is being offered by Chem-Nuclear Systems in association with HPD, both of the United States. The system is part of Chem-Nuclear's turnkey approach to managing utility power plant wastes, in which it accepts the waste stream, processes it, packages it and disposes of it. The processing of liquid wastes with the Geode system is performed in two distinct but integrated, process steps. The first process step provides volume reduction of the liquid waste stream by use of a Mobile Crystallizer Unit (MCU). The second process step immobilizes and stabilizes the concentrated waste solution in disposable liners by use of a Mobile Cement Solidification Unit (MSU).

**088339 BEHAVIOUR OF COMPOSITES USED IN THE CONFINEMENT OF NUCLEAR WASTES.** 3.

**DIFFUSION OF IONS THROUGH EPOXIDE NETWORKS.** The diffusion of cesium and chloride ions through epoxide membranes was studied under a variety of conditions including self-diffusion, the presence of other salts in the aqueous solution, an excess of either reagent used in the manufacture of the membrane, the addition of various fillers in the epoxide network and two temperatures. At 23°C, the diffusion coefficient D was  $(2-6) \times 10^{-13} \text{ cm}^2 \text{ s}^{-1}$  for most systems, except when the epoxide was prepared with an excess of the dioxirane component or when untreated glass beads were added to the networks. In the latter instance D increased and most notably with glass beads. (Edited author abstract) 5 refs.

**088340 SCANNING AUGER MICROSCOPY STUDY OF EUROPIUM PARTITIONING IN SPHENE GLASS-CERAMIC AND PHASE-SEPARATED GLASS.** This study was undertaken within the context of a major research program to evaluate sphene ( $\text{CaTiSiO}_5$ ) glass-ceramics as possible hosts for the radioactive wastes that could result from future recycling of used nuclear fuel. To minimize the release of radioactivity to the environment through waste-form leaching, it is important that most of the long-lived radionuclides be preferentially incorporated into the sphene lattice. The preferential partition of europium into the crystalline phase of sphene glass-ceramics has been unequivocally demonstrated by scanning Auger microscopy. Sphene crystals were located within the sodium aluminosilicate glass matrix by recording digital Auger images for calcium and titanium. Europium was positively detected, by Auger spot analysis, only within the sphene phase of the glass-ceramics. In addition, europium has been shown to be strongly associated with calcium and titanium in the phase-separated precursor glass. Secondary as well as primary phase-separation microstructure was identified in Auger images of the precursor glass for calcium, titanium and silicon. (Edited author abstract) 98 refs.

**088341 STRESS CORROSION RESISTANCE OF PURE COPPERS IN GROUND WATERS AND SODIUM NITRITE SOLUTIONS.** In view of the use of pure copper for encapsulating radioactive waste a programme of tests was undertaken to assess the propensity for stress corrosion cracking in synthetic ground water to which various additions were made. Of the additions studied, only sodium nitrite induced stress corrosion when present at concentrations in excess of  $0.001 \text{ mol l}^{-1}$  and above potentials that varied with nitrite concentration. Oxygen-free high conductivity and phosphorus deoxidised coppers behaved essentially identically. The effects of deaeration of nitrite solutions and raising the temperature to 80°C upon cracking were studied. (Author abstract). 9 Refs.

**088342 TITANATE CERAMICS FOR THE IMMOBILIZATION OF SODIUM-BEARING HIGH-LEVEL NUCLEAR WASTE.** The phase chemistries and microstructures of titanate-based ceramics containing simulated high-level nuclear waste with varying sodium contents were compared. Incorporation of relatively low sodium levels resulted in more complex phase assemblages. The aim of this work was to establish the mechanisms of sodium incorporation into titanate ceram-

ics and determine the degree to which the chemical properties of the waste form deteriorate with increasing sodium content. (Edited author abstract). 65 Refs.

**088343 ADVANCED ROBOTICS MAY HANDLE NUCLEAR WASTE CASKS.** A robotic system that can check nuclear waste shipping casks for damage and exterior radiation contamination has been built and demonstrated at Sandia National Laboratories. The system was developed by engineers who are exploring new design concepts and technologies for such casks. Considerable research, testing, and design have been done at Sandia's Transportation Systems Development Department and elsewhere to ensure that shipping casks can be transported safely. The goal is casks that can shield radiation and be strong and secure enough to withstand severe accidents - high-speed crashes and fires.

**088345 RADIOACTIVE WASTE HIDDEN LEGACY OF THE ARMS RACE.** The soaring capital costs of waste cleanup are making the price of producing nuclear weapons astronomical. Roughly 45 cents of each dollar spent to make bomb-grade material now goes toward managing wastes. Cleanup and waste-handling operations already consume nearly 1 billion dollars yearly, almost an eighth of DOE's budget. Full cleanup of both radioactive and hazardous waste of DOE sites could cost 100 billion dollars. These costs are forcing DOE and Congress to reconsider the need for more plutonium. Progress in arms control could provide further impetus to sharply curtail plutonium production. It is argued that plutonium production, as well as soil dumping of radioactive waste, should halt immediately. EPA should enforce the same standards for DOE as for the private sector. (Edited author abstract).

**088346 NATURAL GEOCHEMICAL ISOLATION OF NEUTRON-ACTIVATED WASTE: SCENARIOS AND EQUILIBRIUM MODELS.** A coupled geochemical/geohydraulic model is used to discuss and interpret possible mechanisms for contaminant transport and accumulation in inorganic environments. Scenarios are constructed incorporating computed system behavior. A comparison of potential contaminant concentrations with acceptable ones allows one to quantify the degree of geochemical isolation of the contaminant which a chosen

environment provides. Long lived waste, activated in the thermal neutron flux of a light water reactor, is classified using the proposed methodology and a very conservative scenario; beryllium, lead, molybdenum, selenium, tin and zirconium activated in the bulk of the reactor decommissioning waste (the bioshield) might be sufficiently isolated by the chemistry in common soils. (Edited author abstract) 55 refs.

**088349 HYDROGEOLOGIE DES ROCHES IMPERMEABLES.** [Hydrogeology of Impermeable Rocks]. The hydrogeology of impermeable rocks plays a significant role in nuclear waste under-ground storage projects. This article first reviews sedimentary rocks with clay intercalations where the non-respect of certain equilibrium conditions between saline waters can lead to residual circulation. It also discusses hard rocks where fracturing is the determining factor. Finally, the salt-bearing deposits whose impermeability is subject to limitations related to risks of dissolution are dealt with. (Edited author abstract) In French.

Goguel, Jean. *Hydrogeologie* n 3 1987 p 155-160.

**088350 ENGINEERING GEOPHYSICAL STUDIES OF THE LOVISA NUCLEAR POWER PLANT SITE, FINLAND.** Field studies have been performed in the power plant area of Lovisa in southern Finland to evaluate the suitability of the local bedrock for disposal of low-level and intermediate-level reactor wastes. The aim of the borehole geophysical studies was to evaluate the geometry and properties of fracture zones in relatively homogeneous granite. Of the single-hole methods, the dipmeter method was used to determine the orientation of individual fractures. The sonic log was used to evaluate the openness (width or thickness) of fractures. Cross-hole methods such as the seismic and the mise-a-la-masse method were used to determine the geometry and continuity of fractured zones between boreholes. It was, in general, impossible to evaluate the continuity of single fractures. However, fracture sets can be identified based on the dipmeter data. The continuity of fracture zones can be evaluated with the combined results of single- and cross-hole methods. (Author abstract) 6 refs.

**088351 BEHAELTER FÜR DIE ENDLAGERUNG RADIOAKTIVER ABFÄLLE.** [Containers for the Final Storage of Radioactive Waste in the Konrad Mine]. The Konrad Mine near Salzgitter-Bleckenstedt is the planned repository for radioactive waste with negligible heat output. The article outlines the boundary conditions for the waste containers as resulting from the plans for the operations phase of the Konrad Mine. Also concepts of radiation protection in the facility and some aspects of mining technology are discussed. For the standardized waste container concept, which served as one of the basic criteria in planning the infrastructure of the Konrad Mine, possible uses, development potentials for volume minimization, and the requirements to be met are outlined. The concept to be employed in packaging radioactive waste, which has been elaborated on the basis of experience accumulated in the test emplacement in the Asse Salt Mine, of the results of research and development projects and, above all, of present practice (e.g., in nuclear power plants and at the national research centers), proves that radioactive waste can be conditioned properly so as to meet the preliminary emplacement conditions for the Konrad Mine. (Edited author abstract) In German. 10 refs.

**088352 WIPP GETS READY FOR OPERATION.** The Waste Isolation Pilot Plant (Wipp) in the United States is now being readied for the receipt of first waste in late 1988. Extensive large scale tests are progressing well, yielding significant data on the design, operation and performance of salt repositories. Some topics discussed by this article are these: the reason for the existence of Wipp; validating the site and design; underground construction; surface construction; an experimental program; Wipp operations; RH TRU waste handling; and CH TRU waste handling.

Sadler, John W. *Nucl Eng Int* v 32 n 401 Dec 1987 p 57-58, 60-62, 65.

**088353 THERMOMECHANICAL ANALYSIS OF SOME PROPOSED SCHEMES FOR RADIOACTIVE WASTE DISPOSAL.** Solutions are presented for the steady state, thermomechanical response of an elastic half space containing either a vertical line source or a horizontal disc shaped source of heat. It is suggested that these solutions may be useful for predicting the long term behaviour of rock masses containing nuclear waste repositories; the solution for the line source being appropriate for the disposal of hot wastes in deep boreholes and the solution for the disc shaped source being applicable to disposal in underground galleries of significant lateral extent. It is demonstrated that in both cases the surface of the rock mass will heave and that there is potential for cracking of the rock overlying the repositories because of tensile stress changes induced in the region near the surface. (Edited author abstract) 7 refs.

**088355 LONG-TERM DISPOSAL OF RADIOACTIVE WASTE: AN INTERNATIONAL ISSUE.** Criteria and technology are falling into place throughout the international community for the disposal of radioactive wastes: near surface disposal for short-lived radioactive wastes, geologic emplacement for the long-lived radioactive wastes. Selection of disposal systems suitable for specific national situations requires extensive technical analysis, much of which includes chemical engineering. (Author abstract)

Lakey, L.T. (Pacific Northwest Lab, Richland, WA, USA). *Energy Prog* v 7 n 4 Dec 1987 p 196-200.

**088356 CHARACTERIZING FRACTURES AT POTENTIAL NUCLEAR WASTE REPOSITORY SITES WITH ACOUSTIC WAVEFORM LOGS.** Fractured igneous (i.e., granite, basalt) rock is one of the most important mediums currently under consideration for the disposal of High Level Nuclear Waste. Flow of groundwater through fractures is the most probable mechanism for transporting nuclides away from the storage facility. If flow velocities are low enough, nuclides will diffuse into and be adsorbed to the rock matrix, where they pose a minimal threat to mankind. Flow velocity is most sensitive to fracture aperture. Hence fracture aperture is a critical parameter to determine during site characterization studies. Small scale laboratory tests illustrate that normalized tube wave amplitude determined from a full waveform acoustic log is indicative of fracture aperture. Theory suggests normalized tube wave amplitude will be representative of the effective fracture aperture which controls permeability. (Edited author abstract) 26 refs.

**088358 PERFORMANCE ASSESSMENT OF RADIOACTIVE WASTE REPOSITORIES.** The current plans for permanent disposal of radioactive waste call for its emplacement in deep underground repositories mined from geologically stable rock formations. The U.S. Nuclear Regulatory Commission and U.S. Environmental Protection Agency have established regulations setting repository performance standards for periods of up to 10,000 years after disposal. Compliance with these regulations will be based on a performance assessment that includes (i) identification and evaluation of the likelihood of all significant processes and events that could affect a repository, (ii) examination of the effects of these processes and events on the performance of a repository, and (iii) estimation of the releases of radionuclides, including the associated uncertainties, caused by these processes and events. These estimates are incorporated into a probability distribution function showing the likelihood of exceeding radionuclide release limits specified by regulations. (Author abstract) 27 refs.

**088359 THERMAL IMPACT OF WASTE EMPLACEMENT AND SURFACE COOLING ASSOCIATED WITH GEOLOGIC DISPOSAL OF HIGH-LEVEL NUCLEAR WASTE.** This article is a study of the thermal effects associated with the emplacement of aged radioactive high-level wastes in a geologic repository, with emphasis on the waste characteristics, repository structure, and rock properties controlling the thermally induced effects; thermal, thermomechanical, and thermohydrologic impacts, determined mainly on the basis of previous studies that assume 10-yr-old wastes; thermal criteria used to determine the repository waste loading densities; and technical advantages and disadvantages of surface cooling the wastes prior to disposal as a means of mitigating the thermal impacts. Waste loading densities determined by repository designs for 10-yr-old wastes are extended to older wastes using the near-field thermomechanical criteria based on room stability considerations. Extension of the surface cooling period from 10 yr to longer periods can lower the near-field thermal impact but have only modest long-term effects for spent fuel. More significant long-term effects can be achieved by surface cooling of reprocessed high-level waste. (Edited author abstract) 134 refs.

**088360 STRUCTURE OF SALT FORMATIONS AND THE RELIABILITY OF BURYING SOLIDIFIED RADIOACTIVE WASTE.** A number of technological problems associated with the features of the salt medium are encountered when underground repositories of radioactive waste of high specific activity are created in rock-salt formations. An important aspect of such repositories is the migration of liquid inclusions under the influence of a temperature gradient; the inclusions usually being present in natural sites of rock salt. Such a transfer of liquid in the medium of the repository of solidified radioactive waste can cause a number of undesirable effects. This article discusses salt formation structure. The reliability of burying solidified radioactive waste is reviewed. 12 refs.

**088361 GERMAN KONRAD REPOSITORY PROJECT.** In the Federal Republic of Germany, it is planned to dispose of radioactive waste with negligible heat generation in the abandoned Konrad iron ore mine. Under the law, the Physikalisch-Technische Bundesanstalt (PTB) is the authorized applicant and thus responsible for the construction and operation of federal installations for the long-term storage and disposal of radioactive waste. On the basis of site-specific safety assessments covering the overall geological and hydrogeological situation, the technical concept of this facility including its scheduled mode of operation and the waste packages to be disposed of, the PTB has demonstrated the safety of the planned Konrad repository in the operational and post-operational phase. (Author abstract) 65 refs.

**088363 LEARNING FROM NUCLEAR WASTE REPOSITORY DESIGN: THE GROUND-CONTROL**

**PLAN.** At present, under a U.S. Department of Energy program, three repositories for commercial spent fuel - in salt, tuff and basalt - are in the phase of site characterization and conceptual design, and one pilot project for defense waste in salt is under development. Because of strict quality assurance requirements throughout design and construction, and the need to predict and ascertain in advance the satisfactory performance of the underground openings, much intellectual energy has been expended to analyze underground openings in the unusual circumstances of the repository environment. In the long term, these efforts will lead to an improved understanding of rock behavior and improved methods of underground analysis and design. For the shorter term, a formalized ground control plan was developed, the principles of which may be applied to other types of projects. This paper summarizes the status of underground design and construction for nuclear waste repositories and presents some details of the ground control plan and its individual elements. (Edited author abstract) 10 refs.

Schmidt, Birger. *Tunnelling Underground Space Technol* v 3 n 2 1988 p 175-181.

**088364 EXPLORATORY SHAFT DESIGN FOR A HIGH-LEVEL WASTE REPOSITORY IN SALT.** The authors describe the exploratory shaft design for a high-level nuclear waste repository in salt. The exploratory shaft facility in salt is one of three facilities - one each in basalt, tuff and salt - to be developed for the Office of Civilian Radioactive Waste Management Program of the U.S. Department of Energy. The authors discuss design criteria for the shaft; the influence of the geotechnical conditions on shaft lining; the shaft construction process; the two types of shaft lining to be used; and determination of the loads on the shaft lining. (Author abstract) 9 refs.

**088365 MODEL CALCULATIONS OF THE THERMOMECHANICAL EFFECTS IN THE NEAR FIELD OF A HIGH-LEVEL RADIOACTIVE WASTE REPOSITORY.** The final disposal of high-level radioactive waste in a salt dome affects the thermomechanical behavior of the surrounding rock salt due to the temperature rise caused by the heat generation of the radioactive waste. The near-field thermomechanical phenomena around several in situ temperature tests and a 300-m-deep conceptual borehole were studied numerically. Thermally induced closure of the boreholes and the strain-stress field distribution in the rock salt following the pressure load on the measuring probe surface and on the waste containers were determined. The calculations were performed with the commercial finite element program ADINA, taking into account the nonlinear and time-dependent behavior of the rock salt. The purpose of these investigations was a validation of the numerical methods, of the thermomechanical material parameters of rock salt, and of the model boundary conditions. (Edited Author abstract) 15 refs.

**088366 CRACKING OF A NUCLEAR WASTE CONTAINER MATERIAL BY IRRADIATION IN A SIMULATED GROUNDWATER.** Fatigue-crack propagation tests were conducted on a container material (ASTM A27 steel) tested in Hanford groundwater at 150°C for application in a potential basalt repository. Tests were run at a single value of stress intensity factor on groups of identical specimens undergoing gamma irradiation and control specimens not exposed to irradiation. The gamma flux levels (approx. 123 rad/hour) were prototypic of the maximum levels expected at the outer surface of the waste container. A statistical evaluation

suggested that there were no significant differences between crack growth rates in the unirradiated and irradiated specimens. (Author abstract) 14 refs.

**088370 DISPOSAL R&D PROGRAMME OF UK NIREX LTD.** This paper is concerned with the long-term safety of a repository deep underground or under the sea-bed, for which the Environment Departments are the regulating authorities. Guidance on the dose target for the performance of a repository in the UK was given more than three years ago. The authors suggest that at that time no other country was putting forward comparable limits, and indeed a number are still not doing so. This is an indication of the UK's lead in the regulatory sense, and is reflected in the lead in their ability to show that UK Nirex Ltd can meet the dose target for any repository that may be proposed. 4 Refs.

George, D. (UK Nirex Ltd, Engl); Tasker, P.W. *Nucl Eng J Inst Nucl Eng* v 29 n 2 Mar-Apr 1988 p 52-56.

**088371 DESIGN CRITERIA FOR AN UNDERGROUND NUCLEAR WASTE REPOSITORY.** Three sites have been chosen as candidates for America's first nuclear waste repository. Each is characterised by different geology which would assuredly influence the method of excavation selected. Comparisons are made between boring and blasting construction for the designs proposed for salt, volcanic tuff and basalt. Support requirements, ventilation and the ability of the geologic system to retard radionuclide migration are also directly influenced by the geology and excavation method. (Author abstract). 2 Refs.

**088372 500 YEAR CONCRETE FOR A RADIOACTIVE WASTE REPOSITORY.** The IRUS repository planned at Chalk River for the belowground disposal of low level radioactive waste relies on the durability of

concrete for the required 500 year service life. A research program for the IRUS repository to design a durable concrete and also to predict its longevity under the repository environment is in progress. The methodology involves the identification of major degradation agents, and the assessment of the rate of diffusion of corrosive ions and/or the rate of advancement of the reaction front into the concrete. Accelerated test methods are being used on laboratory specimens in conjunction with extrapolation procedures to predict long-term durability from short-term data. The inherent limitations are also examined. (Author abstract). 12 Refs.

Ion Exchange

**088375 REMOVAL OF RADIOACTIVE CONTAMINANTS FROM WEST VALLEY WASTE STREAMS USING NATURAL ZEOLITES.** A variety of low-level radioactive waste streams are being generated from the decontamination and decommissioning of the former nuclear fuel reprocessing plant at West Valley, New York. To remove the radioactive contaminants from the solutions by ion exchange, natural zeolites, such as clinoptilolite, erionite, chabazite, and phillipsite, were felt to provide desired flexibility and capacity. Batch and column testing were conducted on these materials using waste streams containing radioactive cesium, strontium, and cobalt. Sorption coefficients, dynamic decontamination factors, capacity, and sorption kinetics were determined. Testing was conducted on prepared zeolites to provide comparative data. (Edited author abstract) 2 refs.

Leaching

**088376 ADSORPTION ON VARIOUS LEACH CONTAINER MATERIALS OF PLUTONIUM AND CURIUM LEACHED FROM NUCLEAR WASTE GLASSES.** Test pieces of quartz glass, PFA Teflon, gold and stainless steel, which are candidates for a leach container, were immersed in deionized water with the waste glass containing  $^{238}\text{Pu}$  or  $^{244}\text{Cm}$  in a Pyrex glass container at 100 degree C, and then they were decontaminated with dilute nitric acid. The quartz glass was found to have the smallest contamination of  $^{238}\text{Pu}$  and  $^{244}\text{Cm}$ . The adsorption amounts of  $^{244}\text{Cm}$  on the PFA Teflon and quartz glass were approximately the same, and for  $^{238}\text{Pu}$  the Teflon showed about twice the amount of adsorption as that measured on the quartz glass. Adsorption and desorption of curium and plutonium were discussed in relation with difference of materials, time dependence and acidity of leachate. (Edited author abstract) 11 refs.

Management

**088377 REDUCES: A PRACTICAL APPROACH TO RADWASTE MANAGEMENT AND MINIMIZATION.** The purpose of this article is to present the REDUCES concept, a practical approach for both the evaluation of radwaste volume reduction programs and the management and minimization of radioactive wastes. Seven basic techniques are described, which can be used at nuclear facilities for the reduction of radwaste volumes. They are: reutilization, ending generation, decontamination, using filtration, compaction, employee participation, and segregation. 4 refs.

**088378 ISSUES IN LOW-LEVEL RADIOACTIVE WASTE MANAGEMENT.** As a result of the breakdown of the nation's radioactive waste management system in 1979, Congress has set a 1992 deadline for states to join together in regional 'compacts' to manage and dispose of their own low-level radioactive waste. This article describes the challenges and opportunities associated with developing a new generation of waste management technologies and their institutional infrastructure, and earning the public's confidence in them. It is written from the perspective of the Chair of the Central Midwest (IL-KY) Compact Commission, but the issues are generic. In fact, their resolution is likely to set precedents for the way we deal with other hazardous wastes in the future. (Author abstract) 6 refs.

**088379 STOCKER, GERER, SURVEILLER LES DECHETS RADIOACTIFS.** [Storing, Managing, Monitoring Radioactive Wastes]. The 'Agence Nationale pour la Gestion des Dechets radioactifs' (National Agency for Radioactive Waste Management) which in France is the organization responsible for this management, distinguishes two main categories of waste. First, the so called short life waste, whose radioactivity becomes negligible in less than 300 years. This waste, produced at a rate of approximately 30,000 m<sup>3</sup> per year, packaging and packing included, is managed industrially. Its definitive storage is now established on the surface, at the La Manche Center near the La Hague Plant. At the beginning of the 1990s this center will be backed-up by a new center located in the Aube. Second, the so called long life waste whose storage, at the beginning of the 21st century, will be by deep geological burying (some hundreds of meters deep) in a structure which is leaktight or very impermeable and which has been stable for millions of years. Four geographical areas have now been prospected. They corre-

spond to four different geological media, clay (Aisne), granite (Deux-Sevres), shale (Maine et Loire) and salt (Ain). (Edited author abstract) In French.

**088380 LA GESTION A LONG TERME DES DECHETS RADIOACTIFS.** [Long-Term Management of Radioactive Waste]. After setting out the terms of reference of ANDRA (National agency for the management of radioactive waste), the author describes the current situation and the projects for the surface storage of waste of low and medium activity. He then discusses the work which has started on the construction of an underground laboratory for studying the storage of long life waste. (Author abstract) In French.

Faussat, Armand (l'ANDRA, Fr). *Rev Gen Nucl* n 1 Jan-Feb 1988 p 51-52.

**088381 RADIOACTIVE WASTE MANAGEMENT IN THE UK.** In the UK, as in most industrialized countries, radioactive materials are used in the generation of electricity, and in industry, defence, medicine and research. Their use brings many benefits, but, at the same time results in the production of small quantities of radioactive waste. Disposing of this waste is not an awesome task. Technically and logistically the problem is quite manageable. The greatest impediment to the establishment of a waste disposal facility is public perception of the risks associated with radioactive materials. This article presents a review of the type of waste generated, and the waste management policy in the United Kingdom.

## Nondestructive Examination

**088383 MOBILE NON-DESTRUCTIVE ASSAY SYSTEM.** A mobile system for non-destructive assay (NDA), developed at the Los Alamos National Laboratory, provides accurate and sensitive measurements for transuranic (TRU) isotopes contained in 208-l drums of miscellaneous nuclear wastes. The NDA unit consists of four major subsystems: an assay chamber, counting and digital electronics, data acquisition, and a neutron generator. It performs both active and passive neutron waste measurements. The former determines the amount of fissile isotopes at a sensitivity level of 1 mg plutonium. The latter determines spontaneous fission and ( $\alpha$ , n) isotopes at a comparable level. A complete assay consists of sequential active and passive measurements. (Edited author abstract) 8 refs.

**088384 IN-PLANT TESTING OF RADWASTE ION-EXCHANGE MATERIALS.** Utilities want to reduce the costs associated with ion-exchange processing of radioactive waste liquids. The in-plant testing method, demonstrated on a pilot scale in this project, gives utility personnel the necessary tool for reducing radwaste liquid ion-exchange processing costs as well as for improving volume reduction factors. For waste chemistry, the liquid streams in this study comprised a variety of chemical and radiochemical constituents, and the composition of the waste was highly variable. The chemical equivalent concentrations of nonradioactive species - which were several orders of magnitude greater than those for the radioactive constituents - were the exhausting species for the rad-waste ion-exchange system. (Edited author abstract)

## Radiation Effects

**088385 VOLUMETRIC CHANGE OF SIMULATED RADIOACTIVE WASTE GLASS IRRADIATED BY ELECTRON ACCELERATOR.** Density changes of simulated radioactive waste glasses, silica glass and Pyrex glass irradiated by an electron accelerator were measured by a 'sink-float' technique. The density changes of the waste and silica glasses were less than 0.05%, irradiated at 2.0 MeV up to the fluence of  $1.7 \times 10^{17}$  e/cm<sup>2</sup>, which were remarkably smaller than that of Pyrex glass of 0.18% shrinkage. Precision of the measurements in the density changes of the waste glass was lower than that of Pyrex glass possibly because of the inhomogeneity of the waste glass. (Author abstract) 16 refs.

**Radioactivity** See STRONTIUM AND ALLOYS—Radioactivity.

**Solidification** See Also NUCLEAR FUELS—Reprocessing.

**088386 INFLUENCE OF NON-TECHNICAL POLICIES ON CHOICES OF WASTE SOLIDIFICATION TECHNOLOGIES.** Several statutes and regulations dealing with the disposal of low-level radioactive wastes are shown to promote non-technical policies which could unduly affect the choice of technology for solidifying wastes. The most influential of these non-technical policies is volume reduction, whether adopted explicitly in statutory language or implicitly by basing disposal fees solely on waste volume. In either case, there is no evidence that those who adopted this policy considered its possible adverse effects of this policy on public health and safety and the environment. To avoid the potential for such adverse consequences, the explicit and implicit consequences of non-technical policies must be fully evaluated to ensure that they do not unduly influence technical decisions on the proper choice of waste treatment, including solidification. (Author abstract).

## Spectroscopic Analysis

**088387 PRECIPITATION OF ACTINIDES AS FLUORIDES OR HYDROXIDES FOR HIGH-RESOLUTION ALPHA SPECTROMETRY.** Management of

radioactive wastes requires sensitive, accurate and reliable analytical procedures by which the radionuclides of interest can be determined in a wide variety of sample types. Procedure are given for precipitating and mounting all actinides from thorium through californium for high-resolution alpha spectrometry by two mutually complimentary systems. One system involves precipitation of fluorides from dilute acid in which most actinides can be separated from each other and from many common interferences by proper use of oxidizing and reducing agents. Elements forming strong fluoride complexes such as iron, titanium, zirconium, etc., do not interfere, but calcium interferes seriously. The other system involves precipitation of hydroxides from strongly alkaline solutions of ethylenediaminetetraacetic acid in which large quantities of calcium can be tolerated. More importantly, the latter system can be used to recover actinides coprecipitated with barium sulfate, which in turn permits use of potassium fluoride fusion to guarantee complete dissolution of the most refractory types of samples. (Edited author abstract) 12 refs.

**088388 PERMEABILITY OF HTR FUEL ELEMENT GRAPHITE FOR TECHNETIUM, CESIUM, AND NEPTUNIUM.** Spent fuel from the operating German High Temperature Gas Cooled Reactor THTR-300 will not be reprocessed but stored in a final repository after suitable conditioning. An accidental ingress of water into the repository could lead to the formation of a brine solution which may corrode the multiple barrier system components and leach radionuclides from the fuel microspheres. It was shown that radionuclides permeate through graphite to a considerable extent, especially from fuel elements undergoing pressure cycles when stored under a brine solution. **088391 CONDITIONING AND HANDLING OF TRITIATED WASTES AT CANADIAN NUCLEAR POWER FACILITIES.** Ontario Hydro operates a 10,000 MW capacity nuclear power system utilizing the CANDU

pressurized heavy water reactor design. The use of  $D_2O$  as moderator and coolant results in the production of about 2400 Ci\* of tritium per MWe-yr. As a result, there is significant Canadian experience in the treatment, handling, transport and storage of tritiated wastes. Ontario Hydro operates its own reactor waste storage site which includes systems for volume reduction, immobilization and packaging of wastes. In addition, a facility to remove tritium from heavy water is presently being commissioned at the Darlington nuclear site. Experience to date, operational procedures being developed and ongoing R&D in this area are described. (Edited author abstract) 4 refs.

**088392 MANAGEMENT OF TRITIUM-CONTAMINATED WASTES AT THE ETHEL FACILITY.** In the frame of JRC's 1984-87 Fusion Technology Programme and with the aim of contributing to tritium R&D for NET, the Commission of the European Communities decided in July 1985 to construct the European Tritium Handling Experimental Laboratory (ETHEL) on the site of the Ispra Establishment. ETHEL is a facility designed to handle a maximum inventory of 100 g tritium. Its detailed design study was started in January 1987 and its commissioning is foreseen for end 1989-beginning 1990. Being well aware of the lack of an efficient, economic and safe technology in the field of tritiated waste management, extensive laboratory research on tritiated waste treatment, conditioning and containment inside multibarrier systems, has been proposed by the research staff of the Ispra Establishment as one of the experimental activities to be performed at ETHEL. Current practices to be applied for routine management of tritiated waste generated during the normal ETHEL operations, as well as objectives of the experimental research that the JRC staff specifically intend to perform in the field of tritiated waste management strategy, are described. (Author abstract) 35 refs.

**088394 NIREX SITE INVESTIGATIONS - PROBABLY THE MOST THOROUGH EVER UNDERTAKEN.** When the decision to terminate site investigation in four possible sites for low-level nuclear waste storage - Elstow, Bradwell, Fulbeck and Kilingholme - was taken, the curtain descended on what was probably the largest combination of site investigation operations ever undertaken in the UK. This work was notable not only for its scale, but also for its thoroughness, and had the original plans been carried out, it might well have been held up as an example. The Oxford Clay appeared to be a particularly suitable formation for the disposal of waste in shallow trenches. Some idea of the work involved in these site investigation operations can be gained by considering the operation at Elstow described in this study.

Anon. *Ground Eng* v 21 n 2 Mar 1988 p 9-10, 12.

**088395 MODIFICATION TO SEGREGATE HIGH-ACTIVITY AND LOW-ACTIVITY RESIN AT BRAIDWOOD STATION.** This paper describes a recent modification made to the radwaste system at Commonwealth Edison Company's Braidwood Station to provide

a tank dedicated to the storage of low-activity spent resin, thereby allowing the existing spent-resin storage tank to be dedicated to the storage of high-activity spent resin. The existing spent-resin tank was originally designed for the storage of spent resin from the primary system, such as that from the primary coolant demineralizers, and of low-activity spent resin from the steam generator blow-down and radwaste demineralizers.

**088397 SENDING LOVIISA'S FUEL TO RUSSIA.** All spent fuel from the Loviisa nuclear power station on the south-eastern coast of Finland is returned to the plant's supplier, V/O Atomenergexport (AEE) of the Soviet Union. The return is carried out using Soviet transport casks and railway wagons specially designed for VVER-440 spent fuel. Road transport trailers owned by IVO are used to transfer the casks from Loviisa railway station to the power plant and back.

**088398 RADIATION DOSE IMPACTS RESULTING FROM VARIATIONS IN THE TRANSPORTATION-RELATED ACTIVITIES IN A SYSTEM FOR MANAGEMENT OF SPENT NUCLEAR FUEL.** In the commercial nuclear spent-fuel management system, potential changes are being considered that will improve the transportation-related aspects of the system. The U.S. Department of Energy (DOE) has recognized that alternative options could be implemented in the authorized waste management system to achieve some improvements. Analyses have been performed for the DOE related to radiation doses in the system to the public and workers that would result from potential changes in the transportation-related aspects in the system. The primary alternatives studied to reduce radiation doses concern increasing transportation cask capacity. (Author abstract) 33 refs.

**088399 PACKAGING AND TRANSPORT OF RADIOACTIVE WASTES.** To ensure the safe and efficient operation of a national radioactive waste disposal facility it is important that the wastes are put in a form which is not only suitable for interim storage and for transport, but also meets the requirements for final disposal. Packaging the wastes to meet these diverse requirements is the responsibility of the waste producers. However, to ensure a coherent scheme, Nirex in close collaboration with waste producers, is co-ordinating the development of packaging standards and guidelines and also developing an integrated transport system. 10 Refs.

**088401 APPLICATION OF LIFE CYCLE COST ANALYSES IN EVALUATION OF NUCLEAR WASTE TRANSPORTATION SYSTEM ALTERNATIVES.** Nuclear waste transportation, an essential part of the DOE's overall waste management responsibilities, entails moving discharged spent fuel (SF) from various US reactors to a geologic repository, possibly via a monitored retrievable storage facility. The SF will be moved in special transportation casks, designed to satisfy stringent performance criteria. Various cask designs, all satisfying the performance criteria but differing in certain other design features, will be considered for the transportation role. This paper discusses the use of life cycle cost (LCC) as an aid in choosing among basic cask design features, and in assessing certain transportation system operating alternatives. The LCC approach is illustrated through analyses of several examples representing competing cask design concepts, cask design features, and system operating options. (Author abstract) 3 refs.

**088404 TMI-2 TRANSPORTATION PROGRAM - DESIGN CONSIDERATIONS FOR THE NUPAC 125-B CASK HANDLING AND LOADING/UNLOADING EQUIPMENT.** Removal, transport and receipt of core debris from the damaged reactor at Three Mile Island Unit 2 (TMI-2) required the design of transport cask handling and 'dry' loading and unloading equipment. The system for 'dry' (not underwater) loading of the transport cask includes; 1) equipment for handling the cask, 2) equipment for loading core debris canisters into the cask at TMI, and 3) equipment for removing the canisters in a hot cell facility. This paper reviews the technical design operational parameters and summarizes lessons learned in the design, testing, startup and use of the equipment provided for the TMI-2 Transportation Program. **088405 NINO CASK-LOADING SAFEGUARDS SYSTEM.** It is, in general, difficult to determine by means of camera-surveillance techniques what is loaded into spent-fuel casks being prepared for shipment from light-water reactors to other reactors, reprocessing facilities, or long-term storage. Furthermore, the expected high frequency of cask loadings in the coming years would place too great a burden on the IAEA and Euratom inspectorates if each had to be observed by an inspector. This paper presents an alternative to both inspector presence at cask loading and operator assistance in applying seals; this alternative is called the No Inspector, No Operator system (NINO). (Edited author abstract) 10 refs.

## United States

**088406 HIGH LEVEL WASTE MANAGEMENT IN USA.** In U.S.A., spent nuclear fuels generated from nuclear power plants are to be directly disposed in repository. Until the repository commences, spent nuclear fuels must be managed under institutional control such as high-burnup, expansion of spent nuclear fuel storage pool capacity. In the report, the status of the countermeasures with regard to spent nuclear storage and the disposal plan of high level waste are described including the current topics. Outline of the regulation in U.S.A. with regard to high level waste is also described. (Author abstract) In Japanese. 22 refs.

## Applications

**088410 LOHNBESTRAHLUNGSZENTREN ALS SCHRITTMACHER DER INDUSTRIELLEN NUTZUNG.** [Toll Irradiation Centers to Pioneer Industrial Use of Radiation]. Treatment with ionizing radiation can greatly improve the quality and the characteristics of use of many industrial products. A major obstacle to the use of this technique, especially in small businesses, is the need to purchase irradiation facilities of the proper size, which require high load factors to be run economically. An obvious solution ensuring the desired high throughput are toll irradiation facilities serving a number of customers. If this approach is to work, the facilities must provide a broad spectrum of radiation energies and powers and must be designed flexibly enough to meet rapidly changing requirements without time consuming retooling and, perhaps, even run in simultaneous operation. (Edited author abstract). In German.

## Health Hazards

**088411 RISK OF LEUKAEMIA IN SEASCALE FROM RADIATION EXPOSURE.** This paper has reviewed an assessment by the National Radiological Protection Board of the risks of radiation-induced leukaemia in children and young persons in Seascale over the period of operation of the Sellafield nuclear fuel reprocessing plant up to 1980. The analysis has shown that in the study population of 1,225 children born in the village between 1945 and 1979, and followed to 1980, 0.1 radiation-induced leukaemias would be expected in children under 20 years of age from all radiation sources. This corresponds to risk of about one in 12,250 for the average child in the study population. 10 refs.

**088412 OBSERVATION OF HEALTH EFFECTS OF LOW LEVEL IONIZING RADIATION IN OC-**

**CUPATIONALLY EXPOSED POPULATIONS.** There is controversy over the correct method of extrapolating from observations made on populations exposed to high doses of ionizing radiation (where carcinogenic effects may be unequivocally demonstrated) to obtain risk estimates for occupationally exposed persons and members of the general public who may be chronically exposed at low levels. Direct observation of the effects of chronic low level exposure may one day be possible in workers in the UK nuclear industry. This paper reviews several studies currently under way in this country and examines the potential of such work for quantifying the risk. (Edited author abstract) 19 refs.

## Industrial Applications

**088413 RADIOISOTOPES AND RADIATION TECHNOLOGY IN INDUSTRY.** Industrial radiation processing is based on the use of radiation as a source of energy to induce specific chemical, physical, and biological changes. On the other hand, applications of isotopes in industry, either as sealed sources or as tracers, rely on the measurements of physical signals which monitor properties of interest. This article offers an overview of radiation processing and tracer applications which are perhaps lesser known, although widely applied for the benefit of industry.

**Mathematical Models** See Also NEUTRONS—Emission.

**088414 ERRORS FOUND IN EXPRESSIONS GIVEN BY SCHAEFFER AND BY SELPH FOR RADIATION FLUX IN RECTANGULAR STRAIGHT DUCT.** Assuming the entrance of a rectangular straight duct to be uniformly covered with a film of radiation source, and the radiations to be emitted into the duct at intensities proportional to  $\cos^2\theta$  ( $\theta$ : Angle of radiation incidence), the unscattered component of radiations along the duct axis is shown. This consequently proves the fallacy of the expressions given by Schaeffer and by Selph for the same assumptions. (Edited author abstract) 5 refs.

**Monitoring** See Also NUCLEAR POWER PLANTS—Radioactivity.

**088415 RADIOACTIVITY MONITORING OF THE WATER CYCLE FOLLOWING THE CHERNOBYL ACCIDENT.** Details are given of the radioactivity monitoring programs following the Chernobyl accident. Measurements of gross beta activity in samples of rainwater, raw water, treated water, waste products from water treatment plants, and sewage sludges, are tabulated. On a limited sampling regime fallout in the Longdendale water catchment, three months after the accident, was investigated and shown to be mainly absorbed onto grass and soil. Water treatment processes were found to be effective in removing radioactive fallout from raw water, and concentrating it into the waste treatment products. The disposal of these waste products is discussed. (Author abstract) 9 refs.

**088416 DISCRETE ANGLE BIASING IN MONTE CARLO RADIATION TRANSPORT.** An angular biasing procedure is presented for use in Monte Carlo radiation transport with discretized scattering angle data. As in more general studies, the method is shown to reduce statistical weight fluctuations when it is combined with the exponential transformation. This discrete data appli-

cation has a simple analytic form that is problem independent. The results from a sample problem illustrate the variance reduction and efficiency characteristics of the combined biasing parameter  $p$  and the preferential direction  $\Omega_0$  used in the combined biasing schemes. (Author abstract) 28 refs.

**088417 ANALYTICAL STUDY OF LEAKAGE ESTIMATORS IN MONTE-CARLO SIMULATION OF RADIATION TRANSPORT.** Variance reduction characteristics of estimators, employed to obtain leakage in Monte-Carlo simulation of deep-penetration problems, are studied. Analytical expressions are developed for the first and second moments of leakage, for a 1-D slab field, with forward/backward scattering, for the various estimators, using the weight moments equation formulation. The estimators studied are the last event estimator and the next event estimator. Survival biasing, normally employed in deep-penetration problems, is also considered. The variance reduction properties of the estimators are compared as a function of scattering probability and anisotropy in scattering. (Author abstract). 10 Refs.

**088418 NEW DETERMINATION OF TRUE NET COUNT-RATES WITH 'PROPORTIONAL' SOURCES OF A RADIOISOTOPE.** In the whole range of observed total count-rates with a constant background rate  $R_b$ ,  $R_1 + R_b$ ,  $R_2 + R_b, \dots$ , a new simple evaluation procedure has been elaborated for accurate determination of the experimental observed-to-true net rate ratios  $R_1/R_1^0 > R_2/R_2^0 > \dots$ , by a series of 'proportional' sources of the same radioisotope. This new evaluation procedure for determining the linear and nonlinear portions of  $R_j/R_j^0$  vs  $R_j$  over the whole range of the observed net count-rate  $R_j$ , in addition, gives a new accurate and simple procedure for evaluating the rational overall resolving time  $\tau'$  from the linear portion of  $R_j/R_j^0$  vs  $R_j$ , where  $j=i=p+1$  to  $n$ . 9 refs.

Ujhelyi, Cs. (Inst of Nuclear Research, Debrecen, Hung). *Appl Radiat Isot* v 38 n 9 1987 p 717-727.

**088419 OPTIMAL MEASUREMENT TIME FOR SHORT-LIVED WEAK RADIOACTIVE SOURCES.** It is shown that an optimal measurement time can be simply determined for short-lived weak sources. The calculated values are presented in a widely applicable graphic form. (Author abstract) 1 ref.

Bikit, I. (Univ of Novi Sad, Novi Sad, Yugoslavia); Slivka, J. *Nucl Instrum Methods Phys Res Sect A* v A260 n 2-3 Oct 15 1987 p 550-552.

**088420 RADIATION ENVIRONMENT OF AN MT-22 MICROTRON.** The main purpose of the present work is to carry out full-scale measurements of the radiation fields around an operating electron accelerator, an MT-22 microtron, and to compare these with estimates based on published recommendations. Measurements made with the aid of activation detectors showed that the flux density of scattered thermal neutrons in the microtron

room ranged from  $10^5$  to  $2 \cdot 10^5 \text{ cm}^{-2} \cdot \text{sec}^{-1}$ . The presence of thermal neutrons causes the formation of isotope  $^{41}\text{Ar}$  with a concentration which, in the absence of air exchange, is close to the maximum allowable limit for the air of industrial workplaces. At the same time, the radiation effect of the  $^{13}\text{N}$  and  $^{15}\text{O}$  isotopes produced in the air as a result of the bremsstrahlung is negligible. 12 refs.

Teterev, Yu.G. *Sov At Energy* v 62 n 5 May 1987 p 396-400.

**088421 LISOL, A TECHNIQUE FOR LIQUID SCINTILLATION ON-LINE MEASUREMENTS.** A new measuring device, called LISOL, for Liquid Scintillation On-Line, has been developed for the detection of alpha and beta-emitting radiotracers in liquid flows. The principle involves continuous withdrawal of a small fraction of the streaming liquid, to which is added acid to suppress hydrolysis and sorption, and a liquid scintillator cocktail, after which the mixture passes a measuring cell viewed by photomultipliers. The advantage of the new device is demonstrated by measuring the distribution (D) of the pure beta-emitter  $^{147}\text{Pm}$  between aqueous  $\text{Na(H)-ClO}_4$  and benzene in the presence of acetylacetone. Reproducible D-values are obtained down to  $\leq 10^{-4}$  and at  $\text{pH} \leq 9$ , where  $\text{Pm(III)}$  is strongly hydrolyzed. (Author abstract) 9 refs.

Albinsson, Y. (Chalmers Univ of Technology, Goteborg, Sweden); Ohlsson, L.-E.; Persson, H.; Rydberg, J. *Appl Radiat Isot* v 39 n 2 1988 p 113-120.

**088422 COMPARISON OF MONTE CARLO SIMULATIONS WITH FISSION TRACK OBSERVATIONS IN APATITE.** Monte Carlo simulations have been made of the revelation of fission tracks through the cleavage plane of a crystal. The distributions of quantities that are normally measured (track dip angle  $\Phi$ ; projected length  $P$  onto the cleavage plane; and depth,  $Z$  measured vertically from the etched surface to the end-point of the track) have been calculated. The derived distribution of spatial length and angle to the reference axis have also been calculated. The effects on these of a gaussian distribution of fission track range, of bulk etching, and of scanning bias have been evaluated. It is shown that, provided that the bulk etching rate is measured, reliable determination of the mean and standard deviation can be obtained. The simulations have been compared with experimental data for apatite crystals cut in the basal plane or in the prismatic plane. (Edited author abstract) 4 refs.

**088423 ANISOTROPIC ETCHING CHARACTER OF SPONTANEOUS FISSION TRACKS IN ZIRCON.** The anisotropic etching character of spontaneous fission tracks in zircon was examined to ensure the reliability of the external detector method. The effect of anisotropic etching on the etching efficiency was evaluated using detailed progressive etching experiments. For zircons whose track density is around  $1 \times 10^6 \text{ cm}^{-2}$ , the angular distribution of etched tracks is found to be isotropic under optimal etching condition, in contradiction to the former studies. (Author abstract) 9 refs.

Sumii, Tomoaki (Kyoto Univ, Kyoto, Jpn); Tagami, Takahiro; Nishimura, Susumu. *Nucl Tracks Radiat Meas* v 13 n 4 1987 p 275-277.

**088424 COMPARISON OF THREE PROCEDURES FOR DETERMINING TRUE NET COUNT-RATES WITH "PROPORTIONAL" SOURCES OF A RADIOISOTOPE.** Three procedures have been published for the exact evaluation of the true net count-rates  $R_1^0 < R_2^0 < \dots$  from directly observed total rates  $R_1 + R_b < R_2 + R_b < \dots$  of 'proportional' sources of a radioisotope. In this work the experimental values of observed-to-true net rate ratio,  $R_j/R_j^0 < 1$ , were evaluated from the linear ( $j=i$ ) and nonlinear ( $j=k$ ) portions of  $R_j/m_j$  vs  $R_j$ . Kohman's method had to be modified to

derive a relation between  $R_j/m_j$  and  $R_j^2/m_j$  for evaluating the apparent rational overall resolving time per count,  $\tau_N$ , and an approximate value of the true net rate per unit mass of a radioisotope solution,  $(R/m)_N^0$ , from  $R_j/m_j$  vs  $R_j^2/m_j$ . 7 Refs.

**088426 DOSE ESTIMATES FROM THE CHERNOBYL ACCIDENT.** The Lawrence Livermore National Laboratory Atmospheric Release Advisory Capability (ARAC) responded to the Chernobyl nuclear reactor accident in the Soviet Union by utilizing long-range atmospheric dispersion modeling to estimate the amount of radioactivity released (source term) and the radiation dose distribution due to exposure to the radioactive cloud over Europe and the northern hemisphere. In later assessments, after the release of data on the accident by the Soviet Union, the ARAC team used their meso-scale-to-regional-scale model to focus in on the radiation dose distribution within the Soviet Union and the vicinity of the Chernobyl plant. (Author abstract). 21 Refs.

Lange, Rolf (Lawrence Livermore Natl Lab, Livermore, CA, USA); Dickerson, Marvin H.; Gudiksen, Paul H. *Nucl Technol* v 82 n 3 Sep 1988 p 311-323.

**088427 PARAMETRIC MODELLING OF TEMPORAL VARIATIONS IN RADON CONCENTRATIONS IN HOMES.** The  $^{222}\text{Rn}$  (radon) concentrations in the living area, the basement, and the underlying soil of a New Jersey home have been measured at half-hour intervals over the course of a year, as have indoor and outdoor temperatures, wind speed and direction, indoor-outdoor and basement-subslab pressures; in addition, periods of furnace operation have been logged. A preliminary version of a mathematical model is developed that demonstrates the dependence of the radon concentrations on the environmental variables and the extent of furnace use, with the purposes of improving the ability to predict occurrences of elevated concentrations in general, increasing the usefulness of short-term measurements in particular, and assisting in the devising of remedial measures. The possibility of determining the model parameters from knowledge or measurement of geological and structural characteristics is discussed. 6 refs.

**088428 USE OF LOW-BACKGROUND GERMANIUM DETECTORS TO PRESELECT HIGH-RADIO-PURITY MATERIALS INTENDED FOR CONSTRUCTING ADVANCED ULTRALOW-LEVEL DETECTORS.** The use of ultra-low-background germanium-diode gamma-ray spectrometers to measure the concentrations of radionuclides in a variety of materials is described. Bulk shielding materials that were examined included contemporary lead, 150-year-old lead, 400-year-old lead, pre-1945 battleship steel, and electrorefined copper. Typically, the samples were constructed such that a thickness of 5 cm or more of material completely surrounded the detector except for the end connected to the liquid nitrogen dewar. Several experiments were performed to gauge the effects of shielding materials on the observed cosmogenic neutron flux. Another experiment was performed at ground level using

one of the germanium diodes fabricated with superclean materials (copper can and cryostat, custom solder, indium o-ring, etc.) and 5-, 10-, and 15-cm-thick low-activity passive Pb shielding to determine the effects of bulk shielding on the observed background. The results are presented and discussed. 3 refs.

**088431 THEORY AND CAPABILITIES OF A  $4\pi\beta\text{-}\gamma$  COINCIDENCE SYSTEM WITH CUMULATIVE DEAD TIMES.** A  $4\pi\beta\text{-}\gamma$  coincidence system working with cumulative dead times, and associated electronics is described. The corresponding theoretical formulae are presented. For testing both electronics and formulae, high-activity sources of  $^{60}\text{Co}$  (up to 1.2 MBq) have been measured successfully. Their estimated uncertainties at one standard deviation were less than 0.25%. (Author abstract) 4 refs.

**088432 SOME DEVELOPMENTS IN THE COX-ISLAM THEORY OF COINCIDENCE CORRECTIONS, INCLUDING THE EXTENSION OF THE COMPUTER-DISCRIMINATION METHOD.** Exact and high-order approximate formulae to correct  $\beta\text{-}\gamma$  coincidence-counting data were derived by Smith based on the theory of Cox and Islam, and in this paper the approximation is generalized to allow unequal resolving times, and also exact explicit formulae are given for the cases of equal dead times and for one dead time being twice the other. The approach is further developed to cover the case of computer discrimination in either a single channel or simultaneously in both  $\beta$  and  $\gamma$  channels. The

single  $\beta$ -channel case requires the accumulation of  $\beta$  spectra in coincidence and anticoincidence with  $\gamma$  pulses. Simultaneous discrimination requires accumulation of such spectra as a function of both  $\beta$  and  $\beta$  energy. (Author abstract) 6 refs.

**088433 DECAY COUNTING IN THE AGE OF AMS.** Up to the advent of AMS, all the accomplishments of  $^{14}\text{C}$  dating, and the studies of  $^{10}\text{Be}$  and other long-lived radionuclides, were made by low-level decay counting, the technique pioneered by W.F. Libby. It will hardly be news to people at this conference that, while much was accomplished in the three decades when counting prevailed, the world has now changed decisively. I will try to give an account of where low-level counting was 'before the revolution,' and of what its usefulness is today. There are still some remarkable examples of its application, the best being the neutrino experiment of Raymond Davis, and its potential successors. Some cosmogenic nuclides, whose half-lives are less than  $10^3$  yr, are still best measured by decay; this will continue unless the overall ion yield of AMS systems rises markedly from present levels. One long-lived nuclide,  $^{53}\text{Mn}$ , is still best measured by neutron activation as  $^{312}\text{d}$   $^{54}\text{Mn}$ , but this may not continue. (Author abstract) 20 refs.

**088434 EFFECT OF TWO DEAD TIMES IN SERIES ON COINCIDENCE MEASUREMENTS.** Dead times in series occur in any counting device where detector signals are electronically amplified, selected for pulse height by a discriminator (or pulse-height analyzer) and fed through a dead-time unit producing a dead time, which has very often been designed to establish definite dead time losses. The problem of two dead times in series has been treated by J.W. Mueller. No attempt, however, seems to have been made up to now to investigate this problem for the electronics of a coincidence system. In this paper two dead times in series are considered that are found either in one or in both channels of a coincidence system. Correlation formulas with experimental evidence are given which allow the deviations from results, which were calculated by taking only one dead time per channel into account, to be estimated. **088435 OPTIMUM GEOMETRY OF LARGE MARINELLI-TYPE VESSELS FOR IN-SITU ENVIRONMENTAL SAMPLE MEASUREMENTS WITH  $\text{Ge(Li)}$  DETECTORS.** Using the peak efficiencies calculated by the PEAK code for 8 and 18%  $\text{Ge(Li)}$  detectors, the optimum geometry of large Marinelli-type vessels (5-60 L), under which the peak efficiency has its maximum value, was obtained in the energy region from 365 to 1332 keV. The result showed that the optimum geometry holds when the sample thickness in the axial and radial directions are equal. (Author abstract) 10 refs.

**088437 CALIBRATION OF A SOLID STATE NUCLEAR TRACK DETECTOR FOR THE MEASUREMENT OF INDOOR LEVELS OF RADON AND ITS DAUGHTERS.** Time-integrated measurements of environmental radiation levels are commonly carried out using solid state nuclear track detectors (SSNTD). These detectors are particularly suitable for monitoring indoor radiation, however they should be calibrated for the measurement of the levels of radon (Rn) and its daughters likely to be found in dwellings. This paper reports the results of experiments conducted to calibrate cellulose nitrate film LR-115 type II, which is used for the measurement of Rn levels in indoor environments of dwellings in India. The detector was exposed to varying concentrations of Rn inside an exposure chamber both in Bare- and in Cup-with-membrane modes. The calibration factors obtained are given. **088438 DATA PROCESSING AND DISPLAY ALGORITHMS FOR PORTABLE INSTRUMENTS.** Data processing and display algorithms that have general utility to the processing of statistically poor data and its subsequent presentation on digital or digitally generated analog displays have been developed for microprocessor-based portable radiation instrumentation. By using a modified exponentially weighted filter, the data displayed become easy to interpret in a much shorter amount of time than normally required. The apparent time constant can be dynamically adjusted based on the statistical validity of the data. Related algorithms are used for the simulation of an analog meter movement and for handling range changing on digital displays. When used together, these algorithms produce an accurate, stable presentation of data that is also considered visually pleasing. 3 refs.

## Japan

**088440 ENVIRONMENTAL RADIOACTIVITY AROUND TOKAI-WORKS AFTER THE REACTOR ACCIDENT AT CHERNOBYL.** Following the reactor accident at Chernobyl, environmental samples of air, rain water and agricultural and marine products were collected and analyzed by gamma- and alpha-spectrometry. The highest concentrations of  $^{131}\text{I}$  in the environmental samples were as follows:  $1.0 \times 10^{-1}$  Bqm $^{-3}$  (aerosol-associated in air);  $3.0 \times 10^{-1}$  Bqm $^{-3}$  (gaseous in air);  $2.1 \times 10^2$  Bq kg $^{-1}$  (plants);  $1.4 \times 10^1$  Bq litre $^{-1}$  (milk). Other nuclides such as  $^{95}\text{Zr}$ ,  $^{95}\text{Nb}$ ,  $^{103}\text{Ru}$ ,  $^{106}\text{Ru}$ ,  $^{125}\text{Sb}$ ,  $^{129\text{m}}\text{Te}$ ,  $^{132\text{I}}$ / $^{132}\text{Te}$ ,  $^{134}\text{Cs}$ ,  $^{137}\text{Cs}$ ,  $^{140}\text{Ba}$ / $^{140}\text{La}$ ,  $^{141}\text{Ce}$  and  $^{144}\text{Ce}$  were also observed in various environmental samples. Based on the monitoring results at one dairy farm, we have derived an equation to model the transport of  $^{131}\text{I}$  from pasture grass to milk. This equation was then applied to the data from two other farms around Tokai-Works and the calculated  $^{131}\text{I}$  activities in milk were compared with those measured. The equation shows good predictive capabilities for quantification of the peak concentrations of  $^{131}\text{I}$  in milk but underestimates longer-term activities. (Edited author abstract) 7 refs.

**088443 COMPUTED TOMOGRAPHY USING URA CODED APERTURE CAMERAS.** In order to obtain a three-dimensional compressed core image in the inertial confinement fusion (ICF) experiment, a new technique for computed tomograph using uniformly redundant arrays (URA)-coded aperture cameras (URA-CT) has been developed. The URA coded aperture camera is known for its high Sn-ratio and large collection efficiency. In this technique we try to reconstruct three-dimensional objects from their coded images obtained using two orthogonal URA coded aperture cameras. In com-

puter simulations, we have obtained a good estimate of the object with a relative error of less than 10%. The principle of URA-CT, computer simulation results and the possibility of applying URA-CT for imaging the three-dimensional compressed core in ICF experiments are presented. (Edited author abstract) 4 refs.

**088444 INVESTIGATION ON INHERENT UNSHARPNESS OF DIFFERENT SCREEN MATERIALS FOR 8 MV X-RAYS AND CO $^{60}$   $\gamma$ -RAYS.** Inherent unsharpness has been investigated for screens of lead, steel, tantalum, and polyethylene with thicknesses between 0.02 mm and 2 mm (as available). The radiations used were Co $^{60}$  gamma-rays and 8 MV X-rays from a linac. According to expectation, the inherent unsharpness increases with screen thickness and depends on energy of course. For both energies the steel and tantalum screens exhibit the lowest unsharpness values at usual and comparable screen thicknesses. When a steel filter is placed between Co $^{60}$  source and film, the width of the measured unsharpness curve is nearly doubled. This is due to the superimposition of a geometric unsharpness caused by the scattered radiation originating from the steel filter. (Edited author abstract) 10 refs.

**088447 ASSESSMENT OF THE PRESENT STATUS OF X-RAY TELEVISION-FLUOROSCOPY-REAR-TIME RADIOGRAPHY.** Television-fluoroscopic equipment applications should be assessed in terms of the flaw sensitivity required in a particular application. Real-time radiography equipment design is a complex problem in which the performances of individual components - conversion screen, camera, pixel matrix, line raster, etc. need to be matched to one another if high quality images are required. If flaw sensitivities equivalent to those attainable on film are required, these cannot at present be achieved with equipments which do not use computer image enhancement and projective magnification, except perhaps when using very high energy X-rays. If computer image enhancement is used, IQI sensitivities equal to those obtainable on film can be attained on a considerable range of specimen thickness, but the flaw sensitivity, in particular crack sensitivity, will be much poorer than attainable on film. To attain crack sensitivities similar to film radiography, even with 'normal film techniques', projective magnification and digital image enhancement are necessary. Additional respects of the subject are discussed. 4 Refs.

**088449 SILVER DISPERSAL IN IMAGE ENHANCEMENT FOR ENGINEERING RADIOGRAPHIC FILMS.** A method is considered for intensifying the silver image in a radiographic film, which is based on raising the coupling capacity of the silver in the primary image, which is based on silver dispersal. Measurements have been made on the sensitometric, structural, and radiographic parameters of films given this treatment. Silver dispersal is found to retain the flaw-detection sensitivity while reducing the exposure time by a factor 2.5-3 when RT-12 or D7 Structurix film is used; if the initial exposure time is retained, one can use a low-silver film type RT-12 m, whose silver content is half. (Author abstract) 12 refs.

## Automation

**088450 RADIOGRAPHIC EXAMINATION TAKES ON AN AUTOMATED IMAGE.** Automation can be effectively applied to nondestructive testing (NDT). Until recently film radiography used in NDT was largely a manual process, involving the shooting of a series of x-rays, manually positioned and manually processed. In other words, much radiographic work is being done the way it was 50 years ago. Significant advances in automation have changed the face of manufacturing, and industry has shared in the benefits brought by such progress. A telling example was found in the assembly operations of the Parlex Corporation, Methuen, Mass., the manufacturer of flexible-rigid multilayer circuits containing as many as 24 layers. In one assembly produced for a missile nose cone, holes had to be accurately drilled through 20 layers, leaving 2 mils of copper around each hole for good contact and reliability. Standard alignment tests, using Quality Conformance Test Coupons, indicated misalignment of the holes, and nearly \$80,000 worth of circuit board assemblies were scheduled to be scrapped. This paper discusses the installation of an in-line radiography system which was put in operation by the Parlex Corporation. The system was built around the Du Pont NDT Daylight Module. The system conclusively demonstrated that the drilling was in fact accurate and that the boards would perform as specified.

**088452 ORTHODONTIC ANALYSIS AND TREATMENT PLANNING: A SUITE OF PROGRAMS FOR PERFORMING CENTROID CEPHALOMETRICS.** The lateral skull radiograph is essential in the diagnosis of facial dys harmony and the planning and evaluation of corrective orthodontic treatment. The classical cephalometric analysis of the lateral radiograph involves the construction of lines and planes based on anatomical landmarks to form a reference system. A new approach to cephalometric measurement based on centres of area (i.e. centroids) has recently been developed. A suite of programs is described for performing various types of centroid analysis ranging from a simple analysis of facial and cranial segments to template matching of cyclical curves. Sample runs are presented. Many of the programs are data-driven which means that they can be readily adapted to new situations. The system is currently being re-written to run in a more standardized environment. (Author abstract) 9 refs.

**088455 FAST POINT SPREAD FUNCTION COMPUTATION FROM APERTURE FUNCTIONS IN HIGH-RESOLUTION POSITRON EMISSION TOMOGRAPHY.** The problem of extracting point spread functions from detector aperture functions in high-resolution PET is addressed. In the limit of very small size detectors relative to the ring dimensions, assumptions are made that lead to a fast and simple computation model yielding point spread functions with negligible errors due to the reconstruction algorithm. The method allows one to assess accurately the intrinsic performance of a PET tomograph, and it appears to be adequate to relate the imaging capabilities in every point of the camera reconstruction field to the geometric and physical characteris-

tics of the detection system. The method was developed as an investigation tool to help design the next generation of very-high-resolution PET tomographs. 27 refs.

## Imaging Techniques

**088458 ENHANCEMENT OF CHEST RADIOGRAPHS WITH GRADIENT OPERATORS.** Reference is made to the Sobel and Roberts gradient operators used to enhance image edges. Overall, the Sobel operator was found to be superior to the Roberts operator in edge enhancement. A theoretical explanation for the superior performance of the Sobel operator was developed based on the concept of analyzing the x and y Sobel masks as linear filters. By applying pill-box, Gaussian, or median filtering prior to applying a gradient operator, noise was reduced. The pill-box and Gaussian filters were more computationally efficient than the median filter with approximately equal effectiveness in noise reduction. 19 refs.

## Industrial Applications

**088459 IMAGING WITH HIGH ENERGY PARTICLES.** Nuclear scattering of 1 GeV protons has been used to radiograph objects. It allows 3-D radiography without any move of the object and beam. Its sensitivity to atomic numbers is very different from the one given by classical methods and it allows one to study more easily heavy materials like iron or uranium. Because of the specific properties of proton-proton scattering, it is able to obtain 3-D radiography of the hydrogen content in objects. The method is described and radiographies of defects in iron and of a hydrogen target are shown. (Author abstract) 5 refs.

**088465 INVESTIGATION INTO THE USE OF TRACK-ETCH IMAGING TO PRODUCE NEUTRON RADIOGRAPHS FROM A NON-REACTOR NEUTRON SOURCE.** A study is described of the use of cellulose nitrate with an enriched boron-10 converter screen for producing neutron radiographs from the RARDE non-reactor neutron assembly. Investigation into the required exposure and etching times has been made together with the measurement of unsharpnesses. The study shows that track-etching gives a sharper image

than that obtained with the dysprosium transfer technique and the image is available for viewing in a much shorter time. (Author abstract) 5 refs.

Ratcliffe, B.J. *Br J Non Destr Test* v 30 n 3 May 1988 p 183-188.

**088466 APPLICATION OF NEUTRON RADIOGRAPHY FOR FLUID FLOW VISUALIZATION.** Real-time thermal neutron radiography has been applied to the visualization of fluid flows. Since neutrons can penetrate metal casings, the technique may be useful for the visualization of fluids flowing inside metal enclosures, etc. The technique described involves shadowgraph imaging of neutron-opaque tracer materials (either solid or fluid particles) as they convect in a stream of neutron-transparent ambient fluid. Real-time motion pictures of several simple flows have been recorded, from which velocities, regions of flow separation, rate of mixing, and other information about the flow field can be obtained. The neutron radiography facility at the Penn State Breazeale Nuclear Reactor and the studies performed to determine viable liquids useful in neutron radiography applications are described. Some examples of successful flow visualizations are also presented. (Author abstract) 7 refs.

**088467 REAL-TIME NEUTRON RADIOGRAPHY SYSTEM PERFORMANCE-MEASUREMENTS AND METHODS.** The real-time neutron radiography facility at the University of Virginia (UVA) was designed to be a flexible neutron imaging facility. This paper describes the methods and measurements implemented to characterize the changes in the radiographic system performance. These include standard measurements of the neutron flux, neutron-to-gamma ratio, the effective collimator length-to-aperture diameter (L/D) ratio, and effective neutron temperature. In addition to these measurements, a method has been implemented to measure the collimator effectiveness and imaging system performance by measuring the modulation transfer function (MTF) of the imaging system. 14 Refs.

## Personnel Training

**088469 CASE FOR AN ASNT CENTRAL CERTIFICATION PROGRAM FOR INDUSTRIAL RADIOGRAPHERS.** This paper evaluates the current regulations for radiation safety training. An inherent weakness of the current system is a lack of uniform training for all radiographers, together with a lack of consistent evaluation of their comprehension of radiation safety principles and practices. Each licensee must provide its own resources to develop and implement its training and evaluation programs. The public and the employee depend on the licensee's resolve, ability, and conscience to perform this training and to evaluate the radiographer's comprehension of safety principles and practices. It is concluded that for this and some other reasons ASNT should move now to answer the nation's need for uniform radiation safety training and certification of radiographers.

**088470 AUTOMATIC DELAY CONTROLLER.** An automatic delay controller is described for a system for radiographic recording of high-speed processes whose speed varies from experiment to experiment. The controller has been used with a MIRA-5B/1 source of single x-ray pulses. The controller is implemented by integrated circuits of series 155 and permits discrete variation of the trigger-pulse delay in the range of (1-16)H, where H is the distance between the detectors of the phase of the high-speed process. The accuracy of locking of the trigger pulse of the x-ray radiator onto a given phase of the process under study is 1  $\mu$ sec. The trigger-pulse delay range is 0-999  $\mu$ sec. (Author abstract) 3 refs.

**088471 X-RAY EXPOSURE METERS.** More attention should be paid to the development of a radiographic exposure meter, particularly in view of the variables that are possible in a radiographic technique - change in film speed, source-to-film distance, etc. The penalties in loss of image quality in getting the exposure wrong are quite considerable. A typical radiographic film requires a dose of about 2 roentgens to produce a density 2.0, and the most convenient system would be to measure the integrated radiation dose reaching the film under the critical region of the specimen during the exposure and cut off the X-ray set automatically as soon as a preset dose has been achieved. One practical solution should be to make an exposure with the measuring instrument in position but without film, and then give the same exposure on a film. This will at least save the cost of trial films on a strange specimen, and also save on film processing time for the trial exposures. 1 ref.

**088473 ELECTORADIOGRAPHY OF OBJECTS WITH COMPLEX CONFIGURATION.** The electro-physical and spectral characteristics of electroradiographic plates are well known but the kinetics of the processes occurring in the semiconductor layer at the time of X-ray inspection of an object with complex configuration, and also the effect of these processes on the image have been insufficiently studied. The article shows that the blurring of the images of boundaries (the effect of 'slight etching') observed in electroradiography of objects with complex configuration is due to peculiarities of the kinetic processes occurring in semiconductor plates at the time of exposure. (Edited author abstract) 4 refs.

**088474 LIMITATIONS IN GAP WIDTH MEASUREMENTS BY X-RAY RADIOGRAPHY.** The use of radiography as a quantitative tool for determining the width and depth of cracks is discussed. It is shown that in most cases the extraction of dimensional information from radiographs may lead to erroneous results. The effects of oblique geometry and a blurring line spread function are modelled. The calculated results are compared with experimental findings. (Author abstract) 11 refs.

Segal, Y.; Trichter, F. *NDT Int* v 21 n 1 Feb 1988 p 11-16.

**088475 APPLICATION OF THE AUTOMATIC FOLLOW-UP SYNCHRONIZER.** A new kind of multifunctional device for accurate synchronization is introduced. It has good anti-interference quality even when operating in a very strong electro-magnetic field. Satisfactory results of application are achieved in X-ray photography, high speed photography, multispark dynamic photoelastic and electrical measurements etc. (Author abstract) 2 refs. In Chinese.

Yang, Yemin. *Binggong Xuebao* n 2 May 1988 p 56-60.

**088476 LOW BACKGROUND X-RAY FLUORESCENCE SYSTEM FOR MICROSPHERE QUANTIFICATION.** An automated low-background X-ray fluorescence detection system was developed for measuring blood flow rates by the microsphere technique. An X-ray beam was polarized to lower Compton scattering. A Si(Li) detector was used for efficient characteristic X-ray detection with preferentially decreased sensitivity for Compton scattering, a CaF<sub>2</sub> scintillation detector was engaged in the anticoincidence method to lower the background, and risetime rejection was used for the same purpose. Solutions of 1 cm<sup>3</sup> each of Rb, Mo, Ag, I, La and Gd with concentration of 0.2-2.0 ppm were measured for 80 min and those of 2.0-20 ppm were measured for 10 min. For Ag the net counting rate was appr. 75 counts/min/ppm. The anticoincidence detector lowered the background by 10% in the region of Ag X-rays. The linear relation between net counts and actual element concentration held up to 1000 ppm for Ag solutions. 12 refs.

**088477 NEW OPTO-THERMAL RADIOMETRY TECHNIQUE USING WAVELENGTH-SELECTIVE DETECTION.** We report the development of a new optothermal radiometry technique, using wavelength-selective detection. The measurement principle is similar to that of opto-thermal transient emission radiometry (OT-TER), but includes a grating monochromator as part of the signal detection system, to enable opto-thermal transients at selected infrared wavelengths to be studied. The technique offers the ability to separate the effects associated with the absorption of exciting light from those of infrared emission. Changes of opto-thermal decay time with emission wavelength can therefore be related to the

infrared absorption spectrum of the sample. First observations on  $\text{TiO}_2$  excited by uv laser light are presented. (Author abstract) 9 refs.

**088478 CHOICE OF THE PARAMETERS OF RADIOMETRIC SYSTEMS WITH DISCRETE SCANNING OF THE RADIATION FIELD.** An expression characterizing the capability of a radiometric system to separately reproduce low-contrast elements of a radiation field is derived. This expression is used to solve the problem of the optimum choice of the size of the detector aperture in the scanning direction and the digitization step for radiometric systems with discrete field scanning. Expressions are derived for the upper and lower limits on the digitization operator with a stepped interpolation. (Author abstract) 9 refs.

**088479 ABSOLUTE RADIOMETER.** The All-Union Physical Optics Measurements Institute has set up the state special standard for the unit of intensity of illumination for solar radiation and has developed an absolute radiometer fitted with an automatic temperature-stabilization system, which enables one to measure intensity of illumination at the level of the best foreign radiometers. The detector is a conical cavity having a base of diameter 12 mm and a vertex angle of  $15^\circ$ . The cavity is formed by electrolytic deposition. This produces the highest thermal conductivity in the detector and high uniformity in the wall thickness. To prevent the copper from oxidizing on prolonged use, the cavity is coated with a thin layer of gold. The inner surface of the cone is coated with black matte enamel. The measurements are made in two phases (irradiation and substitution). The radiometer includes a system for regulating the current in the substitute winding and maintaining a constant temperature in the detector cavity. 7 refs.

**088484 IMPROVED CALIBRATION SCHEME FOR AVHRR-2.** The in-flight two-point calibration of the AVHRR-2 radiometer introduces an error in the brightness temperature derived from the 11  $\mu\text{m}$  and 12  $\mu\text{m}$  channels, due to the non-linearity of the sensor response. The NOAA Users' Guide recommends assuming a negative value for the open space radiance to reduce this error for the range 225-310 K. This range however is too large for typical sea surface temperature variations, and differences as great as 0.4 deg K are still present in the derived 11  $\mu\text{m}$  brightness temperature. This error is further amplified in the sea surface temperature, when estimated with the split window technique, as can be shown by radiative transfer model calculations. For this reason, a new practical calibration scheme is proposed to minimize the error due to the non-linearity of the sensor response, over the range of radiances from the sea surface. (Author abstract) 20 refs.

**088485 NBS SCALE OF SPECTRAL IRRADIANCE.** This paper describes the measurement methods and the instrumentation used in the realization and transfer on the NBS scale of spectral irradiance. The basic measurement equation for the irradiance realization is derived. The spectral responsivity function, linearity of response, and 'size of source' effect of the spectroradiometer are described. The analysis of sources of error and the estimates of uncertainty are described. The assigned uncertainties ( $3\sigma$  level) in spectral irradiance range from 2.2% at 250 nm to 1.0% at 654.6 nm to 6.5% at 2400 nm. (Author abstract) 20 refs.

**088488 SEQUENTIAL FILTER IMAGING RADIOMETER (SFIR) - A NEW INSTRUMENT CONFIGURATION FOR EARTH OBSERVATIONS.** The sequential filter imaging radiometer (SFIR) concept is presented, contrasted with other sensor configurations, and its strengths and weaknesses are discussed. In a pushbroom SFIR the optics image the scene onto a long, narrow area array. The length of the array defines the field of view. The spectral defining filters are sequentially placed over the full array, a sample of data for that band is taken, and then the next filter is placed in front of the array. All filters are placed over the array in the time that it takes for the image of the scene to advance the array width. Thus, the entire scene is observed in each band and the sensor can be configured such that resampling is not required to register the bands to each other. 7 refs.

**088494 GROUND-BASED MICROWAVE RADIOMETRIC OBSERVATIONS OF THE TEMPORAL VARIATION OF ATMOSPHERIC GEOPOTENTIAL HEIGHT AND THICKNESS.** Since 1981, the Wave Propagation Laboratory of the US NOAA has operated a ground-based zenith-viewing microwave radiometer. The radiometer, designed to measure precipitable water vapor, cloud liquid, and temperature profiles, has two moisture-sensing channels and four temperature-sounding channels. Data from this system, taken at Denver, Colorado, are used to derive geopotential heights and thicknesses from the surface (about 830 mbar) to 300 mbar. Time series and spectra of several directly measured and inferred quantities are analyzed for different meteorological situations: a period of unusual calm in surface pressure, a frontal passage, and a gravity wave event. Such ground-based radiometers provide temporal continuity not hitherto available as well as high sensitivity. Comparisons of these data with various sources of ground truth, including radiosondes, satellite cloud observations, and arrays of microbarographs show excellent agreement. 15 refs.

## Noise, Spurious Signal

**088495 NOISE PROCESSOR FOR MODULATION RADIOMETER.** The device alternates two signal-processing algorithms: one for the absence of noise, which is the usual case in radiometry, and another that employs the moving average of the least values, over time intervals that contain noise pulses. The effect of noise that exceeds the fluctuational sensitivity threshold by a factor of up to  $10^3$  is practically completely eliminated by the device. The sensitivity of the radiometer is impaired by not more than 10% in this case. (Author abstract) 4 refs.

### Spectroscopic Analysis

**088502 DETERMINATION OF RADIUM-226 IN ORES, NUCLEAR WASTES AND ENVIRONMENTAL SAMPLES BY HIGH-RESOLUTION ALPHA SPECTROMETRY.** The determination of radium-226 by alpha spectrometry has been investigated critically to determine the exact experimental conditions necessary to achieve these objectives. Refractory solids such as soils, ores, and tailing from uranium mills are dissolved completely by fusion with potassium fluoride in the presence of barium-133 tracer. The fluoride cake is then transposed with sulfuric acid to a pyrosulfate fusion with simultaneous volatilization of all silica and fluoride. Radium is precipitated with barium already present in the sample by addition of lead perchlorate to a dilute hydrochloric acid solution of the pyrosulfate cake. The resulting insoluble sulfates are dissolved in an alkaline solution of diethylenetriaminepentaacetic acid, and the radium and barium sulfates are reprecipitated with acetic acid. Some data on radium-226 in wastes and environmental samples and methods for its removal are presented. (Edited author

abstract) 16 refs.

## Standards

**088503 NEW WORKING RADIUM-226 MASS-UNIT STANDARD.** The  $^{226}\text{Ra}$  mass standard is a standard set of 25  $^{226}\text{Ra}$  gamma sources: 18 Soviet sources, which contain radium salt (radium bromide) in glass ampules; and seven Czechoslovakian sources in capsules of a platinum-iridium alloy with a length of from 13 to 22 mm and a wall thickness of  $0.50 \pm 0.05$  mm. The standard includes a comparator with a  $4\pi$  ionization chamber. Sources with  $^{226}\text{Ra}$  masses of from 1 to 200 mg were compared with specimens No. 5427 by the usual procedure while the sources with a  $^{226}\text{Ra}$  mass of less than 1 mg were compared with another specimen. Values of  $^{226}\text{Ra}$  mass in the sources that make up the working standard obtained by comparison with the state special standard are given. 6 refs.

**RADON** See Also AIR POLLUTION—Indoor; PARTICLE DETECTORS; PHOSPHATE MINES AND MINING—Geology.

**088504 RADON BARRIERS FOR UNDERGROUND URANIUM MINE USE.** Research was performed to assess the feasibility of barrier membrane substances in restricting the diffusion transport of radon gas. Specific tests were conducted, both within laboratory and in situ environments to determine radon gas concentration ratios across a barrier of interest and emanation rate variation resulting from application of such materials. Of the six materials examined only two (polysulfide copolymer and polyethylene terephthalate materials) were capable of maintaining radon concentrations within the initially radon-free chamber at levels less than 5% of the source concentration levels. These same materials were also effective in reducing the unrestricted emanation rate of radon by 99.0% and 99.8%, respectively. (Edited author abstract) 16 refs.

Archibald, James F. (Queen's Univ, Kingston, Ont, Can); Hackwood, H. James. *CIM Bull* v 80 n 908 Dec 1987 p 39-42.

**088505 EFFECT OF COMPOST AND SOIL COVERS ON RADON EMANATION FROM URANIUM TAILINGS.** The effects of covering materials on radon emanations were investigated. Granular materials with air in the spaces allow radon to pass freely. Moist covers of compost or soil decrease radon emanation from tailings. Water-saturated covers were more effective, freezing the tailings with these covers further decreased radon escape. Although radon diffusion through water-saturated powders appears to be slow and inefficient, about 25% of the radon escaping from the grains diffuses to the surface and emanates when no cover is present. (Edited author abstract) 12 refs.

**Concentration** See AIR POLLUTION—Indoor; URANIUM MINES AND MINING—Wastes; WATER WELLS—Testing.

## Environmental Impact

**088506 VARIATION OF RADON LEVELS IN U.S. HOMES WITH VARIOUS FACTORS.** A program combining 70,000 purchased and 3,500 random selection-no charge measurements with extensive questionnaires is described. Winter and spring-fall measurements average about 60 percent and 40 percent, respectively, higher than summer measurements. Basements average 2.5 times higher radon levels than upper floors. Tightening of homes since 1974 has increased radon levels by less than 10 percent, but well-weatherized houses have 40 percent

higher levels than poorly weatherized houses. Open windows reduce levels by a factor of about 2.5. Low-cost newer houses have much lower levels than more expensive newer houses, but among older houses this is reversed. Low income families have substantially lower radon levels than average. Additional aspects of the subject are discussed. (Edited author abstract)

**Environmental Testing** See Also RADIOACTIVITY MEASUREMENT—Instruments.

**088507 INDOOR RADON LEVELS IN CUMBERLAND COUNTY, PA.** Measurements was made of radon levels in 165 randomly selected homes in Cumberland County, PA during Winter 1984-1985. The average and mean levels were found to be  $9.1 \pm 0.7$  pCi/L and  $6.3 \pm 0.5$  pCi/L, respectively, many times normally encountered levels. Average and mean radon levels are reported vs. various house characteristics. (Author abstract) 4 refs.

**Health Hazards** See Also WATER SUPPLY—Contamination.

**088509 EVALUATION DE L'EXPOSITION NATURELLE DUE A L'INHALATION DES AEROSOLS RADIOACTIFS ISSUS DU RADON A L'INTERIEUR DES LOCAUX D'HABITATION.** [Evaluation of Natural Exposure Due to the Inhalation of Radioactive Aerosols Descended from Radon Within Residential Buildings]. Since 1980, the Atomic Energy Commissariat in France has been carrying on a pilot study aimed at measuring the alpha potential energy of short-life descendants of radon. This parameter characterises in effect the internal exposure to inhaled natural radioelements. A particular study has been undertaken in the Finistere department in 1984-1986. This region, situated at the extreme west of the country covers an area of 7000 km<sup>2</sup> and is rich in granite soils, especially in the north west and south. The results of this study are presented. Its originality was in the fact that the measurements were carried out jointly by means of integrated active and passive dosimeters. The experimental techniques are described. No clear impact of radioactive exposure on health situation has been determined. 11 refs. In French.

**Measurements** See AIR POLLUTION—Indoor; GASES—Permeability, Mechanical.

## Permeability, Mechanical

**088510 MEASUREMENT OF RADON PERMEABILITY THROUGH SOME MEMBRANES.** A mixture of gaseous radioisotopes with different half-lives can be separated by passing it from one volume to another through an appropriate intervening barrier or membrane so that short-lived radioisotopes decay before reaching the detector kept at a suitable position after the barrier. This separation technique is ideally suited for use along with

the solid state nuclear track detectors and has been attempted by a number of scientists for separation of thoron ( $^{220}\text{Rn}$ ) and radon ( $^{222}\text{Rn}$ ). A number of membranes evaluated for their suitability for these applications have been discussed in this paper. Natural latex rubber and cellulose nitrate membranes of suitable thickness have been found best suited among the membranes studied. (Author abstract) 10 refs.

**Radioactivity** See Also ATMOSPHERIC RADIOACTIVITY.

**088511 HUMAN EXPOSURE TO RADON DECAY PRODUCTS.** Much concern has been expressed about the radiation exposures resulting from radioactive discharges from the nuclear industry. Yet, on average, only about 0.1% of the average person's exposure is due to this practice. The majority, according to current estimates somewhat less than 90%, of the average person's exposure is received from natural radiation sources, the remainder being largely due to medical procedures and fallout from weapons tests. After discussing the variation in exposure to radon decay products, the author considers some of the different ways of reducing the harmful effects including increased ventilation. (Edited author abstract) 13 refs.

Wrixon, A.D. (Nat'l Radiological Protection Board, Didcot, Engl). *H&V Eng* v 59 n 675 p 19-22, 29.

**088512 INDOOR CONCENTRATION OF RADON AND ITS DAUGHTERS IN A MULTISTOREY BUILDING.** Long-term measurements of radon and its daughters in nineteen different rooms of a multistorey building in Aligarh having different types of environmental conditions have been performed. CR-39 solid state nuclear track detectors were used to measure the radon concentration. Variations of radon concentration due to height from ground level, ventilation conditions, convection air currents and materials placed inside were investigated. The highest value of radon has been found in the basement and the ground floor rooms which indicates the influence of subsoil emanation. No appreciable effect was observed with height above ground. Our study also reveals that ventilation conditions, convection air currents, housed materials such as books, papers, etc., affect the radon concentration. (Author abstract) 19 refs.

Khan, A.J. (Aligarh Muslim Univ, Aligarh, India); Varshney, A.K.; Prasad, Rajendra; Tyagi, R.K. *Nucl Tracks Radiat Meas* v 13 n 1 1987 p 77-80.

**088513 INDOOR RADON GAS AND ITS DETECTION WITH KODAK PLASTIC FILM.** The indoor radon problem is reported from the Swedish standpoint. The radon sources, problems with the radon daughters, the radon detector Kodak LR115-II and some experimental results are discussed from a teaching point of view of the subject. (Author abstract) 22 refs.

Jonsson, G. (Univ of Lund, Lund, Swed). *Nucl Tracks Radiat Meas* v 13 n 1 1987 p 85-91.

**088514 GENERATOR FOR  $^{222}\text{Rn}$  DECAY PRODUCTS.** In extracting and working uranium ores and in using emanating sources containing  $^{226}\text{Rn}$ , one provides radiation monitoring of the air by means of radiometers operating with the natural aerosols and recording either the bulk activity  $q$  ( $\text{Bq} \cdot \text{m}^{-3}$ ) or the latent energy  $E_a$  ( $\text{J} \cdot \text{m}^{-3}$ ) in the daughter products from the radon. The measures planned to implement GOST 8.090-79 on metrological support to measurements of bulk activity and latent energy from radon daughter products has led the authors to devise a generator based on accumulating radon and its short-lived daughter products in a closed

volume by the use of an emanating  $^{226}\text{Ra}$  source. This article presents theoretical background of the radon generator. 5 refs.

**088515 RADON IN AIR CALIBRATION PROCEDURE: A PRIMARY METHOD.** A procedure has been developed for preparing 3 to 9-l volumes of air under natural conditions with a known concentration of  $^{222}\text{Rn}$  to be used for calibrating radon systems. Air is passed into a plastic bag through a standard  $^{226}\text{Ra}$  solution (prepared by the U.S. National Bureau of Standards) contained in an emanation flask. This plastic bag retains  $^{222}\text{Rn}$  with little loss into or through the bag walls. The mean ratios of the  $^{222}\text{Rn}$  in the air at 2 and 7 days after filling to that immediately after filling were  $0.992 \pm 0.006$  and  $0.969 \pm 0.008$ , which suggests a rate of radon loss into the bag of  $0.4 \pm 0.1\%$  day. (Edited author abstract) 6 refs.

**Removal** See WATER TREATMENT—Aeration.

## Sampling

**088516 APPLICATION OF A RECURSION FORMULA TO AIR SAMPLING OF RADON DAUGHTERS.** The analytical solution to compartment models with time-independent coefficients can in general be expressed in terms of easy memorizable functions with recursive properties. The only restriction is that the model must be of a nonfeedback type. In this contribution the recursive formalism is applied to air sampling of serially decaying radon daughter products. (Author abstract) 6 refs.

## RAILROAD ACCIDENTS

**Deraiment** See Also RAILS—Stresses.

**088517 GETTING SAFER IN THE '80s.** The number of train accidents per million train-miles dropped from 6.01 in 1985 to 4.87 in 1986. The rate for employee injuries on a per-man-hour basis and the rate for grade crossing accidents on a per million vehicle basis also improved in 1986. The steady improvement in the 1980s was a natural result of railroad improvement programs. Railroads have continued to spend large amounts of money to maintain highway grade-crossing safety devices and to educate the public about the potential hazards of ignoring rail-highway crossing warnings. The increased spending is directly linked to deregulation. The Federal Railroad Administration takes credit for improved safety, which it believes resulted from imposition of federal track and equipment standards.

Roberts, Robert. *Mod Railroads* v 42 n 10 Oct 1987 p 33-35.

## RAILROAD PLANT AND STRUCTURES

See Also RAILROAD SIGNALS and SIGNALING—Centralized Control; RAILROADS—Research; TUNNELS and TUNNELING—Construction; TUNNELS and TUNNELING—Design.

**088518 REMOVAL AND REPLACEMENT OF A ONE HUNDRED YEAR OLD FOUNDATION SYSTEM ?.** The New Jersey Transit Corporation came into being as a corporate entity on January 1, 1983. The birth of that corporation brought with it an inheritance of a number of predecessor commuter rail road lines. These rail lines included such systems as the Delaware Lackawanna and Western; Erie-Lackawanna; the Pennsylvania Railroad and Conrail. The inheritance included Rolling Stock; dedicated routes and trackage; maintenance facilities - both direct and leased; stations and other properties. Plans had been made to improve various aspects of the

system. Two of the major improvements included an upgrading of the electric traction system and the construction of a Rail Equipment Maintenance Facility (REM-F). Due to the uncertainty of subsurface conditions and the potential effect on piling operations, the building footprint would be excavated to the top of the glacial sands. The approximate eight foot head of water anticipated during the twelve foot excavation would be controlled by the installation of an impervious membrane and the use of pumping. This study describes the sequence of foundation removal and replacement of all rail equipment maintenance buildings.

**Air Conditioning** See AIR CONDITIONING—Energy Conservation.

## Concrete Construction

**088519 CP RAIL LOOKS TO MORE EFFICIENT FUTURE.** The huge construction project high in the Rockies of British Columbia includes the building of two tunnels and six bridges over a 21-mile double-track stretch of rugged terrain and will cost \$600 million. Among outstanding accomplishments one stands out, construction of Mt. Macdonald Tunnel. The tunnel also features a ventilation system unique to this hemisphere. Another first is the use in both tunnels of a system of slab track called Pact-Track. Another record is the tunnel boring machines set a production record of 62.78 meters of rock excavation by a 6.7-meter diameter machine in a 24-hr. period.

Roberts, Robert. *Mod Railroads* v 42 n 11 Nov 1987 p 19, 21, 23.

**088520 ELECTRIFICATION OF THE DSB MAIN LINES - DESCRIPTION OF THE OVERHEAD CONTACT SYSTEM.** As a result of the introduction of electric traction on the main lines of the Danish railways, an overhead contact system (OCS) for power supply to the electric locomotives is to be erected over 2100 single track kilometers. The wires are supported on a number of different constructions, of which the mast is the most common. The components included in the OCS have formed the subject of research work. The result has been an OCS which can be operated at 200 km/h, has a minimum cost regarding production, installation and maintenance, and gives a good architectural and functional adaptation to the surrounding landscape. The power supply installation is a 25 kV/50 Hz a.c. system, in contrast to the 15 kV d.c. of the Copenhagen suburban electrified system. The 25 kV/50 Hz system was selected, since it is the optimum for Denmark nowadays. 7 refs.

Olesen, Preben (DSB, Copenhagen, Den); Naeser, Johannes; Andersen, Lars. *Elektr Bahnen* v 85 n 5 1987 p 139-142, 144-146.

**088521 INBETRIEBNAHME DES ERSTEN ABSCHNITTES DER NBS MANNHEIM-STUTTGART; ANLAGEN DER ELEKTRISCHEN ZUGFÖRDERUNG.** [Commissioning of the First Section of the New Mannheim-Stuttgart High-Speed Line; Electric Traction Facilities]. At the end of May 1987 a 38-km section of the new Mannheim-Stuttgart high-speed line was put into operation. For power from supply purposes the existing 110-kV-traction current line Mannheim to Karlsruhe has been combined with the new traction current line into a quadruple line. At the new Wiesental substation the electric power is stepped down to 15 kV and fed into the overhead contact line. The new high-speed line section designed for 250 km/h was equipped with the

recently developed Re 250 overhead contact line. (Edited author abstract) 7 refs. In German.

**088522 CONSTRUCTION OF PLANNED SHINKANSEN LINES.** The expansion of the Shinkansen railway network has been carried forward in conformity with the Law for the Construction of a Nationwide Shinkansen Railway Network enacted in May 1970. The project involves five lines, namely, Morioka-Aomori, Aomori-Sapporo, Tokyo-Osaka via Takasaki and Komatsu, Hakata-Kagoshima, and Hakata-Nagasaki. Since these lines are not expected to have as large a ridership as the already existing Shinkansen lines, every effort is being made to hold construction costs within tight limits at both the planning and engineering stages.

Minemoto, Mamoru (JNR). *Jpn Railw Eng* v 27 n 1 Jun 1987 p 7-11.

**088523 FOUR ISLANDS BECOME ONE.** With the introduction of the next JR Group timetable in April, both Hokkaido and Shikoku will for the first time enjoy through train services to Honshu, which was joined by undersea tunnel to Kyushu in 1942. Thus the four main islands of Japan will have a unified 1067 mm gauge network. The link to Shikoku called for the construction of a total length of elevated structures of 12.3 km across five small islands with 9.4 km over the Seto inland sea. There are three suspension bridges with central spans of 940, 990 and 1100 m; two cable-stayed bridges with central spans of 420 m; and one cantilever truss bridge. The connection to Hokkaido, the Seikan Tunnel, is the world's longest. In constructing it, all kinds of geological difficulties were encountered, and it was necessary over much of the distance to bore a conical pattern of holes ahead of each drive through which grout could be injected to stem the inflow of water. Both the cost and the time necessary to drive the tunnel were seriously underestimated.

Anon. *Railw Gaz Int* v 143 n 12 Dec 1987 p 801-803.

**088524 LE SAUT-DE-MOUTON DE LA NOUVELLE VOIE SNCF DU RACCORDEMENT FERROVIAIRE GENEVE-AEROPORT.** [Flyover Carrying the New SNCF Track on the Geneva Airport Rail Link]. A 6 km double-track line was needed to provide a rail link to Geneva airport. It runs along the line from Geneva to Lyons, via La Plaine frontier station, from just outside Geneva station and over a distance of 3.5 km. So as to maintain a passenger railway link between Geneva and France, an additional track complying with SNCF regulations had to be built; it runs over a flyover passing beneath the tracks of the CFF line to the airport, which it then follows on the southern side. This article describes the different types of work involved and the difficulties encountered in building this structure. (Edited author abstract) In French.

Nieth, Rodolph (CFF, Geneva, Switz); Mouchet, Pierre L.; Boissonnard, Robert; Deleglise, Bernard; Rojas, Johnny; Herrera, Fernando. *Rev Gen Chemins Fer* v 106 n 10 Oct 1987 p 35-52.

**088525 PLANUNG UND BAU DER OSTWEST-S-BAHN IM HAUPTBAHNHOF NEUSS.** [Planning and Construction of the East-West S-Bahn Line at Neuss Main Station]. The construction of the 82-km East-West S-Bahn line from Hagen to Moenchengladbach is necessitating major new building and rebuilding work at the point of intersection of several lines on the left bank of the Rhine at the approaches to Neuss main station. In this connection a description is given of the rearrangement of the tracks being carried out in order to

separate the new suburban services from the long-distance lines, including the construction of a number of flyovers. In German. 5 refs.

Form, Egbert (Hauptabteilung Projekte Bautechnik, Cologne, West Ger). *Eisenbahningenieur* v 38 n 11 Nov 1987 6p between p 547 and 555.

**088526 WORLD'S FIRST 300 Km/H TRACK GOES IN.** Twenty months ahead of the formal opening civil works on the Paris-Le Mans leg of TGV-Atlantique are almost complete. The only major civil engineering work remaining on this section is the construction of the second bore of the 4.8 Km Villejust Tunnel and completion of a new interchange station at massy outside Paris. With the first TGV-A prototype train due to be unveiled in May 1988, SNCF is well on course for inaugurating the World's first 300 Km/h train service at the beginning of October 1989.

Anon. *Railw Gaz Int* v 144 n 2 Feb 1988 p 82-83.

**088527 NEW LINES HOLD THE KEY TO BAHN 2000.** The principle underlying Bahn 2000 is that trains will be able to run between certain major interchange stations in less than 60 min, so that they can all arrive just before the hour and depart just afterwards, thus creating the maximum number of opportunities for quick connections. In this way, journeys can be made swiftly and conveniently all over Switzerland. Apart from providing extra capacity where it is most needed, Bahn 2000 concentrates infrastructure investment on key links between major stations which at present take just over 1 h. It includes four new line construction project, as well as a large number of schemes designed to raise the speed, capacity and convenience of existing routes. At the same time the private railways are planning to provide matching improvements to raise capacity and speeds.

Anon. *Railw Gaz Int* v 144 n 2 Feb 1988 p 91.

**088528 SPAIN LAUNCHED ON HIGH SPEED QUEST.** The Spanish National Railways (Renfe) has started construction of a new 250 km/hr route from Madrid to Andalucia. This new line will put Cordoba just 2 h from the capital compared with the present fastest journey time of 4 h 19 min. To achieve this, the existing Madrid-Ciudad Real line, used at the moment by only four daytime passenger trains and one overnight service, will be completely rebuilt as a double track electrified main line aligned for 250 km/h. South of Puertollano a new line will be constructed through open country to Alcolea just east of Cordoba. This translates into 340.8 km of high speed line, including the various spurs to link with other routes.

Hughes, Murray. *Railw Gaz Int* v 144 n 2 Feb 1988 p 101-103.

**088529 CP WIPES OUT INVESTMENT BACKLOG.** For the first time in 60 years, the Portuguese government is committed to a major railway investment program. A new plan for investment in the national rail network up to the end of the century calls for completion of a new railway bridge over the Douro River at Porto, construction of a rail crossing on an existing road bridge over the Tagus in Lisbon, upgrading of the rail network in the Lisbon area and construction of a link between the isolated Algarve line and the Tagus bridge, and improvement of rail links between Portugal and Spain.

Anon. *Railw Gaz Int* v 144 n 2 Feb 1988 p 107-109.

**088530 DER AUSBAU DER TAUERNBAHN.** [Upgrading the Tauern Line]. The double-tracking of the Tauern line is being carried out primarily to increase the transport capacity of this important transit link within the network of the Austrian Federal Railways. At the same time, a gradual increase in train frequency can be achieved through the elimination of bottlenecks and a significant increase in maximum speed can be achieved through structural improvements in the line. The upgrading work, particularly on the southern approach to the Tauern Tunnel, requires a large number of technically demanding civil-engineering structures, owing to the very difficult

terrain over this stretch. These structures include some large reinforced concrete arch bridges. In German.

Potucek, Walter. *OIAZ Oesterr Ing Archt Z* v 132 n 11-12 Nov-Dec 1987 p 393-395.

**088531 ELEKTRIFIZIERUNG DER STRECKE NUERNBERG-LAUF (LINKS DER PEGNITZ).** [Electrification of the Nuremberg-Lauf Line (Pegnitz Left Bank)]. In connection with the introduction of S-Bahn operation in Nuremberg the Nuremberg-Lauf line on the left bank of the Pegnitz has been electrified. Class Re 160 overhead contact lines have been erected on this 17-km stretch. The power will be delivered from the existing Nuremberg substation. Through the construction of a new 110-kV traction current line the twin feeding of this substation from the 110-kV mains has made progress. For the 15-kV-feeding a new sectioning point was installed in the Nuremberg main station. The 50 Hz electric power supply installations were correspondingly adapted. (Edited author abstract) In German.

Gabler, Rudolf (Bundesbahndirektion Nuernberg, Nuernberg, West Ger). *Elektr Bahnen* v 85 n 11 1987 p 373-374, 376.

**088532 DIE KUNSTBAUWERKE ZUR EINFUEHRUNG DER NEUBAUSTRECKE HANNOVER-WUERZBURG IN DEN WUERZBURGER HAUPTBAHNHOF.** [Structures Required to Route the New Hannover-Wuerzburg Rail Link into Wuerzburg Central Station]. It is necessary to connect the new rail link to the existing railway system in Wuerzburg. The solution entails the railway line crossing a Federal road and three sets of railway tracks on a 153 m long prestressed concrete beam which runs over three spans. This hollow-girder superstructure links up to a 133 m long frame structure with two and three supporting members respectively, and to a 287 m long ramp structure. The aim was to skillfully integrate these structures into the landscape of the Main Valley. (Edited author abstract) In German.

Schwarz, Ortwin (Projektgruppe H/W Sued der Bahnbauzentrale, Nuernberg, West Ger); Hofmann, Rudolf; Bischoff, Rudolf. *Beton Stahlbetonbau* v 83 n 3 Mar 1988 p 61-64.

**088533 GESTALTUNG UND INSTANDHALTUNG DER BAUTECHNISCHEN INFRASTRUKTUR DER DB FUER DEN HOCHGESCHWINDIGKEITSVERKEHR.** [Layout and Upkeep of the German Federal Railway's Civil Engineering Infrastructure for High-Speed Traffic]. This article begins by defining the requirement profile for the civil engineering infrastructure by reference to DB's high-speed services plans. These provide for mixed traffic comprising heights trains with wheelset loads of 22.5 tons at 100 kph and passenger trains at 250 kph on newly built lines and up to 200 kph on modernized existing lines. On the later, this will necessitate adaptation of the fixed structures by removing bottlenecks, extending platforms and modifying signalling equipment, plus the authorization of higher limits for the existing superelevation and free lateral acceleration in curves. The article then looks at the layout planning for track and switches on the new lines and describes the installation of the permanent way. It concludes with an overview of the planned upkeep system aimed at maximizing availability of the lines by coordinating various tasks and minimizing speed-restricted sections. (Edited author abstract) In German.

Naue, Konrad H. (Deutsche Bundesbahn, Frankfurt Am Main, West Ger); Neuhofer, Wolfram. *Eisenbahningenieur* v 39 n 3 Mar 1988 p 81-87.

**088534 ELECTRIFICATION DE LA LIGNE MORET-NEVERS.** [Electrification of the Moret-Nevers Line]. The electrification of the Moret-Nevers line, known as the Bourbonnais line, marks the completion of an important stage in the improvement of services to the Massif Central. Two electrification systems have been employed: 1500 V dc from Moret to the south of Montargis so as to continue the installation of a single-current supply system in the Paris outer suburban area

and enable in the near future a regular-interval train service to be provided of the Paris suburban type; 25 kV ac from the south of Montargis to Nevers so that nonstop Paris-Nevers trains can be operated at a commercial speed of 135 km/h. Furthermore, signaling has been modernized by installing color-light automatic block equipment from Moret to the south of Montargis and restricted permissive automatic block equipment as far as Nevers. The renovation of passenger buildings and the construction of underpasses and car parks have improved the amenities provided passengers and should result in an appreciable increase in traffic. (Edited author abstract) In French.

**088535 DIE NEUE BAHN NACH ANDALUSIEN SPANIEN ORIENTIERT SICH BEI SEINEN NEU- UND AUSBAU-STRECKEN AM BEISPIEL DER DEUTSCHEN BUNDESBahn.** [New Railway to Andalusia, Spain Follows the Model of the German Federal Railway for its New and Modernized Lines]. This paper deals with the construction of the new high-speed electrified line from Madrid to Cordoba. The work involved includes the upgrading of an existing single-track line from Madrid to Brazatortas via Ciudad Real to a high-capacity double-track line, the construction of a wholly new double-track line from Brazatortas to the outskirts of Cordoba, and the construction of two small connecting segments just south of Madrid the new line will be more than 100 km shorter than the line currently used, which runs via Manzanares and is single-track over a rugged stretch through the Despenaperros Pass. Travel times on the new line will be reduced to less than half those on the old line. The new high-speed line will not be a purely passenger line, as in the case of the French TGV, but will carry mixed passenger and freight traffic like the new high-speed lines being built in West Germany. 4 Refs. In German.

## Crossing Gates

**088536 BASIC CONCEPTION OF ELECTRONIC LEVEL CROSSING SYSTEM.** In recent years, the introduction of microelectronics into railway signaling systems has been promoted. Now, the introduction of microelectronics into a level crossing system is anticipated. A level crossing system consists of a train detector, a level crossing alarm, a level crossing signal, a crossing gate, an obstacle detector and a fault detector. These devices are still controlled on an electromagnetic relay logic basis. This paper clarifies problems in an existing level crossing system, proposes technical measures for the introduction of microelectronics, and discusses the functions and effects of the new system. (Edited author abstract)

**Crossings** See Also HIGHWAY SIGNS, SIGNALS AND MARKINGS; HIGHWAY TRAFFIC CONTROL; TUNNELS AND TUNNELING—Railroad.

**088537 EVALUATING GRADE-SEPARATED RAIL AND HIGHWAY CROSSING ALTERNATIVES.** The research project documented in this report was initiated in response to the need for a systematic and credible tool to make decisions regarding alternatives for improving deteriorated bridges separating highways and railroads. A growing number of these bridges are in need of rehabilitation or replacement. The report is divided into two parts. The first part, the research report, provides background information and covers the approach used to address the research objective including, as well, a detailed discussion of the findings dealing with the objective. It

describes current practice regarding the decision-making processes used by state governments and railroads regarding deteriorated, grade-separated rail/highway crossings. The second part, consisting of two appendices, presents the decision-making framework in detail. Appendix A is the User's Guide to applying the framework and provides a step-by-step description of how one may use the framework. Case studies (Appen. B) are provided to illustrate the application of the framework.

Taggart, R.C. (Ernst & Whinney, Washington, DC, USA); Lauria, P.; Groat, G.; Rees, C.; Brick-Turin, A. *Natl Coop Highw Res Program Rep* 288 Jun 1987 87p.

**088538 EXPERT SYSTEM FOR THE EVALUATION OF RAIL/HIGHWAY CROSSINGS.** This paper describes the stages in the development of an expert system for evaluating and prioritizing highway/railroad grade crossings for safety improvements in the state of Virginia. In the identification stage, the four main aspects of the problems are identified. They are the participants in this project and their roles, the problem to be solved, the resources required, and the objectives in building the expert system. The next stage, the conceptual analysis, deals with recognizing the key concepts and relations forming the basis of the system. The formalization stage describes how the expert's knowledge is formalized within the framework of the selected tools, and the implementation stage describes how the formalized knowledge is codified into a computer program. Finally, suggestions are provided for turning the current prototype system into a full-scale expert system. (Edited author abstract) 5 refs.

**088539 MICROELECTRONIC ALARM AND PROTECTION CONTROL FOR LEVEL CROSSING EQUIPMENT.** Microelectronic Alarm and Protection Control for Level Crossing Equipment (Abbreviated as MAPLE) has been developed to automate control of level crossings and to renew obsolescent installations with the least investment. Features of the MAPLE with built-in microcomputers are: high reliability, compactness in size; capability of indicating detailed information to passers-by, easy and simplified maintenance work, and standardized design applicable to any of the level crossings.

Kumagai, Toshio (Railway Technical Research Inst, Jpn). *Jpn Railw Eng* v 27 n 2 Sep 1987 p 18-20.

**088540 PACKAGING CROSSING SAFETY PROBLEMS AWAY.** This package concept is the process by which the company receives an order to prepare the engineering plans, assemble all the necessary material, perform shop wiring and testing - in essence to do everything to deliver the complete system. The initial engineering, material, fabrication and 'delivery' services in a given package might include: field inspection services; budget preparation; specification writing; site surveying; circuit design and plan preparation; all control system components; relays; power supplies; signal structures and other wayside equipment. Field inspection as part of the package might encompass manpower and equipment for putting into proper operation all material necessary for the project.

Anon. *Railw Track Struct* v 84 n 5 May 1988 p 50-51.

**088541 P.C. PROGRAM FOR GRADE CROSSING SAFETY.** Called GIS, the Grade Crossing Improvement Schedule Software Package is designed to help those responsible for grade crossing safety to establish priorities in their grade crossing improvement efforts. The program consists of entering data into a large data base, then using the numbers in the Department of Transportation accident prediction model to estimate the number of accidents likely to occur at a particular crossing during a specific number of years. GIS can be run on the IBM PC, XT, AT, or a 100-percent compatible machine having a minimum of 512 K of memory. It is a menu-driven program. That is, the user selects desired options from a screen of

alternatives, and continues on until new data is entered, edited, deleted, or possibly a desired report might be printed.

Anon. *Railw Track Struct* v 84 n 5 May 1988 p 52-53.

**088542 NEW DEVICES IMPROVE CROSSING SAFETY.** Active advance warning devices (AAWDs) are one area of interest. Recently, three devices that would conform to current MUTCD signing practices were studied. Each had the following features: A primary advance grade crossing sign, such as W10-w or similar in design. A supplemental watch for trains plate mounted below the primary sign. A pair of alternately flashing yellow beacons mounted above and below the signs already described. Study results are discussed. Speed sensors are another important area of study. Constant warning time (CWT) systems are used to give a uniform time between activation of the signal and arrival of the train at the crossing. A nationwide study found 6,300 crossings equipped with CWT, and 13,100 more that could be equipped with the systems.

## Earthquake Resistance

**088543 EXPERIMENTAL STUDY ON PREVENTION OF EMBANKMENT DEFORMATION DUE TO LIQUEFACTION OF SANDY GROUND.** In preparing for future large earthquakes in the Tokai district, model embankment experiments were carried out using a large-sized vibrational table to confirm the method of preventing Tokaido Shinkansen embankments from deforming due to ground liquefaction induced by earthquakes. The relationships between liquefaction occurrence characteristics and ground properties, and the effects of four kinds of countermeasures were investigated. It was concluded that the sheet pile enclosure method is the most effective one for embankment deformation prevention. (Edited author abstract) 1 ref.

## Ice Problems

**088544 STUDY FOR ICICLE PREVENTION BY ADIABATIC TREATMENT IN RAILWAY TUNNEL.** The prevention of icicle and side ice formation in railway tunnels is an ever-recurring subject. Recently, icicle prevention by adiabatic treatment of tunnel linings has been developed and has been adopted in many railway tunnels. This paper summarizes analyses of the icicle/frost damage in tunnels, including adiabatically treated old tunnels and newly constructed tunnels, and a suggestion is made about the availability and designing of this prevention. (Edited author abstract) 3 refs.

**088545 AMTRAK'S BEAR COMPLEX.** The 167-acre complex consists of four buildings which total over 233,000 square feet. The largest, the Main Shop, houses three departments: System Equipment Overhaul, Mechanical, and Material Control. Each year an average of 210 machines, primarily track maintenance equipment, undergo overhauls. Every piece is routed from the field to the shop and back by the railroad's tractor trailers. And the machinery's every move is monitored and managed by an IBM 36 System and two compatible personal computers. The system's memory also includes maintenance and work

histories, repair schedules of all equipment and vehicles, as well as the Bear Complex's entire inventory.

**088546 GREAT SALT LAKE AT BAY.** The Southern Pacific (SP) and Union Pacific (UP) railroads have committed themselves to a safeguard against repeated flooding of the Great Salt Lake. This protection takes the form of the West Desert Pumping Project (WDPP). The WDPP is fundamentally a large evaporation pond, supported by a complex which includes a heavy duty pumping station. The project is located just west of the Great Salt Lake. It will forestall future inundations and damage to the SP and UP railroad structures, and to other commercial properties adjacent to the Lake.

**088547 ABDICHTUNG VON INGENIEURBAUWERKEN AUF ACRYLBASIS.** [Acrylate-Based Sealing for Engineering Structures]. The renewal of faulty sealing on arch bridges with high earth cover or on other engineering structures presenting difficult working conditions previously constituted a technical problem that could only be solved at high cost and virtually always involved considerable disruption of operations. A first attempt was made at the Karlsruhe Bundesbahn Directorate in 1982 to renew faulty insulation by means of an acrylate-based gel substance. The process has meanwhile been successfully applied to other structures. (Author abstract) In German.

Meseck, Henry (Bundesbahndirektion Karlsruhe, Karlsruhe, West Ger). *Eisenbahningenieur* v 39 n 2 Feb 1988 p 59-60, 62-63.

**088548 EDV-UNTERSTUETZTE ARBEITSVORBEREITUNG FUER DIE INSTANDHALTUNG MASCHINENTECHNISCHER UND ELEKTROTECHNISCHER ANLAGEN.** [EDP-assisted Job Preparation for the Maintenance of Mechanical and Electrical Installations]. German Federal Railways (DB) is compelled to minimise costs for the stationary installations required for railway operation. In order to attain and safeguard the requisite level of productivity in the otherwise fairly low-profile 'auxiliary service', that is, maintenance, the organisation of the interplay between men, materials and installations is of paramount importance. The project 'EDP-assisted job preparation for the maintenance of mechanical and electrical installations', the pilot phase of which has been concluded, and which is currently being prepared for introduction in the field, represents a data capture and exploitation system by means of which job volume, scheduling and location can be largely determined in advance in order to avoid periods of slackness. At the same time it offers improved data accuracy. (Author abstract) In German.

Hentschke, Hans-Juergen (Zentrale Datenverarbeitung der DB, Frankfurt, West Ger); Kammerer, Helmut. *Eisenbahningenieur* v 39 n 4 Apr 1988 p 129-136.

**088549 'HOW CAN I STAY AHEAD IN TURNOUT CARE?'** The easiest method in avoiding turnout problems is to make sure that the rail is supported on sound ties, that a sufficient number of gage-holding and plate-holding spikes are present, and that everything is supported in turn on good quality, well consolidated ballast. Sometimes, the addition of a Point Guard Rail will help give each wheel passing through the turnout an extra push. Some track owners have had successful results from the installation of resilient rail fasteners on all of their switch ties. At least one railroad has gone as far as installing a gage plate four ties ahead of the toe of the points, complete with security rail braces.

Smith, Allan D. (Industrial Track Consultant). *Railw Track Struct* v 84 n 7 Jul 1988 p 59-60.

**088550 SUCCESSFUL SHORT LINE UPGRADING.** The rehabilitation program had to be tailored resourcefully to comply with the restricted funding. Thus, by

replacing only those ties which had failed completely, renewal tie quantity was held down to an average of 1300 per mile. Secondhand ties were purchased. The railway installed enough new anchors to provide box-anchoring on eight ties per 39-foot length of rail. Secondhand plates have been used to replace numerous broken plates. A quarry located about four miles from its track is capable of supplying suitable dolomitic limestone for ballast. With the exception of a very few that had been rebuilt recently and prior to the program, all the other crossings are being rebuilt. Switch ties are being replaced selectively.

Ahl, Robert E. *Railw Track Struct* v 84 n 7 Jul 1988 p 61-64.

**Maintenance of Way** See Also SUBWAYS—Paris, France.

**088551 RECTIFICATION OF RAIL GEOMETRY ON NETHERLANDS RAILWAYS.** For corrective maintenance of welded rail Netherlands Railways (NS) employs the mobile STRAIT facility to straighten welds. Since 1986, the mobiles STRAIT facility has been equipped with a rail head claw, which results in a large economic benefit compared to the earlier STRAIT version with the hook because ballast no longer has to be dug out. This makes possible a cost reduction of about 20% weld. 3 refs.

Esveld, Coenraad (Netherlands Railways, Neth). *Rail Eng Int* v 16 n 4 1987 p 7-11.

**088552 REVENUE GROWTH BUYS DYNAMIC STABILISERS.** Within the next six months, British Rail will take delivery from Plasser & Theurer of nine dynamic track stabilisers (DTS). Together with two machines that BR already owns, they will be deployed on the principal routes north and west of London so that time can be cut from InterCity schedules. BR anticipates that commercial speeds can be increased by around 5 per cent through a reduction in the present timetable allowance for temporary restrictions of speed (TRS), thanks to the use of DTS and other techniques, such as accurate profiling of the ballast bed using laser guided machines. TRS allowances on some routes, such as the East Coast main line from London to Edinburgh, will be cut in the new timetable starting on May 16, and further reductions will be phased in over two or three years.

Anon. *Railw Gaz Int* v 144 n 2 Feb 1988 p 93.

**088553 FINDINGS CONCERNING MECHANISED MAINTENANCE OF SWITCHES AND CROSSINGS.** Taking Plasser & Theurer's Unimat 08-275 as an example, the author indicates the features which a track maintenance machine must possess in order to ensure good switch and crossing maintenance. It is shown that only with laterally displaceable units and individually tiltable tamping tines it is possible to achieve perfect tamping of narrow sections around the diamonds, guard rails, guide rails, deflecting blades, etc. For excellent tamping quality, it is of great importance to adjust the penetration depth of the tamping tines. Pressure vibration tamping according to the principle of nonsynchronous uniform pressure guarantees absolutely uniform results. For switch tamping it is particularly important that the operators have an excellent view of the work area.

Klotzinger, Erwin (Austrian Federal Railways, Vienna, Austria). *Rail Eng Int* v 17 n 1 1988 p 21-24.

**088554 BALANCING THE 'INS' AND 'OUTS' OF MoW.** The article examines the problem of short lines/new lines regarding the estimation of their track needs before knowing if projected revenues would support the desired maintenance-of-way or rehabilitation programs. The question of whether to outsource track work or do it in-house demands far more than just a cost comparison. Rather than simply trying to save money, short line engineering departments report that other factors take center stage when they decide to contract out track work. Other factors new railroads have to look at include track conditions, long-term plans and traffic mix.

Borzo, Greg. *Mod Railroads* v 43 n 9 May 1988 p 27, 29.

**088555 DEVELOPMENT OF MECHANISATION ON THE PERMANENT WAY IN AUSTRIA IN RELATION TO THE ECONOMIC SUCCESS.** Mechanization on Austrian Federal Railways began in 1950, when a foreign-made, mechanical track tamping machine was put into service. In 1953 Messrs. Plasser & Theurer started production in Linz of the first hydraulic tamping machine (work output approx. 80 m/hour). The uniform construction of the tracks makes them suitable for fully mechanized work and this opened the way for rapid development. The first Automatic Lining Machine, AL 202, went into service in 1963. The average output of this machine was 105 m/hr. From 1962 onwards Switch Tamping Machines were also in use in order to be able to tamp mechanically switches and crossings. In order to partly restore the lateral stability of the track lost during lifting and tamping, the ballast between the sleepers must be consolidated. For this purpose sleeper crib consolidators (BKV 112) were introduced. Adequate amounts of ballast filled into the track are essential to avoid track buckling. After tamping and lining there should be a uniform ballast profile. This was achieved using Ballast Distributing and Grading Machines (USP 3000). To ensure high quality and at the same time an economical use of track maintenance machines in the track intervals available, Austrian Federal Railways was the first railway in 1967 to use groups of machines known under the name of 'Mechanised Maintenance Train' (MDZ). Another important milestone in the course of mechanization of permanent way work was the development of the Track Tamping Machine Mainliner Duomatic 07-32 SLC and the Switch Tamping and Lining Machine Plassermatic 07-275.

Klotzinger, Erwin (Austrian Federal Railways, Vienna, Austria). *Rail Eng Int* v 17 n 2 1988 p 4-10.

**088556 HISTORIC DATA ON TRACK GEOMETRY IN RELATION TO MAINTENANCE.** The program of work of the ORE Committee D 161 was initiated to determine how the dynamic interaction between vehicle and track influences track deterioration and the subsequent need for track maintenance and renewal. This paper examines the basic concepts of this work on the basis of an analysis of historic track data and reports the most important conclusions to date. It is shown how the development of systematic track geometry inspection by modern accurate recording cars allows the local track quality to be quantified at regular intervals. The data thus obtained can be used to optimize maintenance work, especially for tamping machines. 8 Refs.

Anon. *Rail Eng Int* v 17 n 2 1988 p 16-19.

**088557 LABORATORY STUDIES ON MUD-PUMPING INTO BALLAST UNDER REPETITIVE RAIL LOADING.** The maintenance of permanent way laid on weak subgrade soils has posed problems to the Indian Railways due to differential settlements leading to incorrect alignment of track. In most cases these problems are found due to pumping of mud into ballast under the influence of repetitive wheel loads. This phenomena is also accompanied by loss of substantial percentage of ballast into the subgrade soil thereby reducing the percentage of recovery of ballast for reuse. The Indian Railways now contemplates to tackle these twin problems of differential settlement and loss of ballast by interposing a geotextile layer in between the ballast and the subgrade. In this paper the associated problems faced by the Indian Railways are described. An attempt has also been made to fabricate a repetitive loading apparatus to study the influence of molding water content, soil texture and the geofabric protection minimizing the differential settlement and pumping effect on fines into the ballast. Relevant experimental data are presented and conclusions are reported. (Edited author abstract). 4 Refs.

Shutler, M. *Sulzer Tech Rev* v 70 1 1988 p 16-18.

**088564 HIGH LEVEL STEEL FOR PORTSMOUTH STATION.** Stepping aside from its present tendency to refurbish historic railway architecture, British Rail have chosen to replace the Victorian high level canopy over Portsmouth and Southsea station with an exposed lattice beam portal frame structure. To support the new 150mm thick reinforced concrete platform, with shear studs and a 12mm non-slip screed, a steel frame was erected on top of the existing steelwork. Structurally, the canopy used to be tied into the viaduct but is now completely separate, so that the viaduct carries only the tracks and platform. The 70m long canopy in eight bays consists of pin-ended exposed lattice portal frames, 9m high and spanning 15m. These portals support 1200mm deep triangular lattice beams which in turn, carry the barrel vault roof structure.

**088566 BN 'SWATS' TRACK MAINTENANCE**

**CHORES.** The Swat team concept is being demonstrated vividly by the customized approach the track people are taking in maintaining Burlington National (BN's) heavily trafficked mainline segment between Alliance and Lincoln, Nebraska. As part of a track improvement effort, the BN employed four ballast undercutter/cleaners, each of these units being backed by full-support working consists including a ballast train and necessary surfacing machinery. Among other contributing equipment were special switch and crossing rail grinding machines.

Anon. *Railw Track Struct* v 83 n 10 Oct 1987 p 26, 28-30.

**088567 GRINDER PROFILES RAIL SELECTIVELY.** The nature of transitional track geometries, along with restricted clearances and rail cross-sectional variations at switches, have made computer control a must for precise, modern spot grinding. Loram's SX Rail Grinder (called the SX-16, if there are sixteen grinding stones mounted on the unit) is designed to produce an effective rail profile and to eliminate surface defects within special track sections. The 16-stone version of the SX Grinder employs grinding patterns that cover six sections in profile along the ball of the rail. In improving the relationship between the switch and stock rail, the machine is capable of grinding at angles from plus-60-degrees gage to minus-45-degrees field. The field and gauge surfaces are ground first, followed by treatment of the rest of rail ball area during the remaining increments.

**088570 ESTIMATION OF THE FATIGUE STRENGTH OF FRAME MEMBERS IN RAIL STRAIGHTENING MACHINES HAVING A CYCLIC ACTION.** Straightening machines (SM) of types VPR-1200 and VPRS-500 used in construction, repair and maintenance of railway track, usually fail as a consequence of frame damage. The frames are made in the form of complex three-dimensional structures of the bar type, mainly of channels and rolled plate material. Their loading is predominantly dynamic in character, and damage in use occurs basically as a result of the development of fatigue cracks. The influence of constructional factors on the resistance to fatigue failure of welded constructions of SM frames was investigated on testpieces closely approximating the standard frame members.

**088571 BENEFITS OF THE NEW SOUTH WALES RAIL TRACK UPGRADING PROGRAMME 1977-82.** The track conditions current in 1977, and the rates of deterioration at that time are studied. Also the long term effects of these on the running of trains and system reliability are determined for 1982, should the upgrading program not have been carried out. These include the increases in train running times due to the excitation of speed restrictions, and the level of disruption caused by the increasing frequency of major derailments. The improved track condition evident as a result of the upgrading program is considered and the benefits to the efficiency of train running in the State Rail Authority determined. A statistical analysis of the improved track condition from Track Recording Car data is provided. Additional aspects of the subject are discussed. (Edited author abstract)

**088573 IMPROVING TUNNEL TRACK.** This paper describes briefly the magnitude of the problem facing the railroad industry in confronting track maintenance in tunnels. It outlines some approaches to tunnel track rehabilitation. It also offers some practical hints, with brief touches upon cost comparisons, in regard to the different types of tunnel track work described. Some background on the magnitude of the tunnel track is given.

Abbott, Russell A. (CSX Transportation). *Railw Track Struct* v 83 n 11 Nov 1987 p 24, 26, 28-29.

**088574 SMOOTHING THE 'HEAVY HAUL' TURNOUT.** The author's own 'ultimate' in modern turnouts for heavy haul track in North America includes: curved, 'chamfered' design of a 'flexible' switch with asymmetrical switch-point sections; rail hold-down by modern elastic fastenings; and swing nose frog. The turnout described 'provides the smoothest, most continuous path possible that the wheels can take as they travel through it.' This capability, affords the same benefits railroads now get from properly aligned and well-supported CRWR in their mainline track. These benefits include extension of turnout component life, plus a significant lowering of M/W costs. Both stem from the reduction of the dynamic loads imparted to the turnout elements.

Birkinshaw, John. *Railw Track Struct* v 83 n 12 Dec 1987 p 21-25.

**088575 FINITE ELEMENT ANALYSIS OF TRACK STABILITY.** During the period from November 1986 to August 1987 a theoretical study was made of horizontal track stability under the influence of temperature loads. The first phase of the research concentrated on problem analysis and model design, the second phase on testing and verification of the computer program SPAT. It was found that SPAT is able to calculate the stability of tracks with an arbitrary geometry under temperature and/or concentrated loads. The program can also be used for research into the relationship between curve radius and temperature for which instability or large lateral displacements occurs. 5 refs.

**088576 IMPROVING PROCUREMENT OF SPECIAL TRANSIT TRACKWORK.** In building the Long Beach-Los Angeles light rail transit line, the Los Angeles County Transportation Commission (LACTC) chose to let a separate, special contract for procuring turnout materials. This strategy encouraged competition between suppliers by calling for a special trackwork design attractive to both domestic and foreign manufacturers, yet one which would not compromise quality or performance. The commission's task was made all the more difficult because of the wide disparity between the existing domestic and foreign designers. In order to promote equal interest in the project among foreign and domestic suppliers, the Commission adopted a hybrid design employing many of the desirable features of European and American trackwork practices, but without giving a price advantage to any particular supplier.

Jackson, Bertie. *Railw Track Struct* v 84 n 1 Jan 1988 p 34-36.

**088577 LOAD FACTOR METHOD FOR DYNAMIC TRACK LOADINGS.** Design of track structural components and foundations is based upon design loads higher than the nominal static values. These design loads generally have been determined using dynamic impact factors as multipliers of the nominal static loads. A review of commonly used impact factors is given, as dependent upon track and vehicle characteristics, and operating conditions. Field measurements of the distribution of static and dynamic wheel loads at five sites are presented. A load factor method, derived from the field measurements, is given that can be used to characterize the distribution of track loads. Although a single wheel or axle load may be appropriate for the design of certain structural components, multiple axle loadings should be used to estimate stresses and deformations that result at depth, or to analyze the loadings on buried structures. An approach is outlined to characterize the complex multiple axle dynamic load distribution for use in a probability-based design procedure. (Edited author abstract) 20 refs.

**088585 CHARACTERISTICS OF CONSOLIDATED BALLAST ON ELEVATED STRUCTURE OF TOKAIDO SHINKANSEN AND PROPOSALS FOR ITS TREATMENT.** To know the characteristics of consolidated ballast - fouled with fines derived from the ballast itself or transformed into solid mass of ballast and such particles - on elevated structure of Tokaido Shinkansen, laboratory tests were performed using 16 samples of ballast taken from various sections of track laid with different kinds of rocks. Results of these tests clarified the conditions under which the ballast consolidates: voids in the ballast mass are filled with small broken pieces of ballast as well as fines, the fines acting as 'bonding' materials in wet condition, and the ballast is dried up and compressed to an increased density. They also show that samples of consolidated ballast can disintegrate when they are soaked in water and applied with a slight force. On the basis of these results, we propose new ideas of treating degraded ballast.

**088586 DEVELOPMENT OF VIBRATION-DECREASING SLAB TRACK OF TYPE G AND ITS**

**PRATICAL USE.** The type G vibration-decreasing slab track has been developed with improvements over the characteristics of the track slab spring constant and the stress distribution of type A slab track. Its structural features are as follows: the slab mat has grooves which make it possible to reduce restrictions to the deformation by having a free surface; a piece of soft polyethylene is glued under the track slab at the central part of its width; and the slab supporting spring constant of the end part is made larger than that of the intermediate part. Thus this slab track can be used in practice as a standard structure of vibration-decreasing slab track. This paper describes the process of its development, its structure and the results of a performance test on the Koga section of the old narrow-gauge Tohoku line north of Tokyo. (Edited author abstract).

**088587 DEVELOPMENT OF A WELD PROCEDURE TO REPAIR JOINTS IN A RAILROAD-TYPE TRACK.** This report describes the steps in the development of a weld repair procedure for a precision railroad-type track upon which instrumented carriages run as they tow ship models through the water. The track is located at the David Taylor Research Center, Carderock, Md., the U.S. Navy's principal research, development and test center for a broad range of new vehicle-related concepts. The task was to rebuild the rail to the original dimensions with weld metal of the same wear resistance (hardness). A specialized weld-repair application provides procedure and design information that can be applied to many welding problems. 5 Refs.

**088588 PERFORMANCE OF LARGE-SCALE MODEL SINGLE TIE-BALLAST SYSTEMS.** Large-scale models of a single tie-ballast system were constructed over artificial ballast support that had variable compressibility. The principal objectives of the experimental work were to investigate the influence of load level and ballast support compressibility on the rate of accumulation of permanent deformations and ballast degradation. The test results show that at a given load level the rate of tie settlement is quite sensitive to ballast support compressibility. A competent ballast support resulted in a deformation-log tonnage response that was essentially linear. However, progressively weaker supports gave increasing semilogarithmic rates of settlement with tonnage. For a given support compressibility, a critical load level was identified that, if exceeded, led to a dramatic increase in settlement rate. (Edited author abstract). 13 Refs.

**088589 APPLICATION OF PETROGRAPHIC ANALYSIS TO BALLAST PERFORMANCE EVALUATION.** An interpretation is presented of ballast performance test results that uses the information obtained from petrographic analysis of ballast material to help assess the importance of this technique as a means of evaluating ballast. Fourteen ballast materials were used in this study. These were tested in a special ballast box apparatus under differing conditions of equivalent wheel load, material gradation, and number of load cycles. Mill abrasion and ballast cementing tests were also performed on these materials and Los Angeles abrasion values were obtained from the ballast suppliers. Identification of the mineral composition and texture of the ballast material, as well as inherent planes of weakness such as foliation and cleavage, can be accomplished using petrographic analysis. With a few exceptions, petrographic analysis was

found to provide a reasonable explanation of the performance of the ballast materials in each of the tests. (Edited author abstract). 16 Refs.

**088590 PRODUCTION AND TESTING OF BALLAST.** The traditional method of selecting ballast has been based on physical testing of representative specimens to ensure that materials have adequate wearing resistance, toughness, physical stability, and strength to meet predetermined criteria. Tests such as magnesium sulphate soundness or abrasion resistance give indirect evidence of how the ballast properties can be expected to change in the track structure. None of the tests currently employed, with the exception of gradation, gives direct information to explain the physical behavior and chemical stability of a ballast source. This paper demonstrates a rational methodology for the selection of natural rock ballast sources. To obtain the most cost-effective investment in ballast, source selection, site investigation, quarry design, quality control, and selection of specifications should be based on the geologic characteristics of the source. (Edited author abstract). 6 Refs.

**088591 TRACK EVALUATION AND BALLAST PERFORMANCE SPECIFICATIONS.** A variety of laboratory tests has traditionally been used in the selection of a material and gradation for ballast. The results of the laboratory tests are commonly used to reject or accept material for use as ballast and rarely imply benefits or costs of selecting alternative materials or gradations. In this paper are presented the results of a track sampling and evaluation program to determine the performance of ballast, subballast, and the subgrade on Canadian Pacific (CP) Rail. A simple method was developed to determine if a significant portion of maintenance of the track structure is attributable to the subballast and subgrade. The concept of ballast life is presented with a relationship between ballast quality and grading. CP Rail specifications for the selection of a ballast material and the processing of ballast are also presented. (Edited author abstract). 8 Refs.

Klassen, M.J. (Canadian Pacific Rail, Calgary, Alberta, Can); Clifton, A.W.; Watters, B.R. *Transp Res Rec* n 1131 1987 p 35-44.

**088592 EVALUATION OF BALLAST MATERIALS USING PETROGRAPHIC CRITERIA.** Mineralogy is a major factor in determining overall rock hardness and physical durability, chemical weathering potential, composition and quantity of derived fines, and degree of susceptibility to wetting and drying. Rock texture also affects hardness and is important in influencing toughness, relative susceptibility to freeze-thaw degradation, and mechanical stability in track. Most of the standard tests commonly applied to ballast materials essentially provide a measure of a combination of petrographic properties; consequently, the results of the tests can be predicted to within certain limits. Numerous techniques, including the use of microscopes and X-ray diffraction equipment, can be applied in the study of the fines fraction of track samples to determine the nature and source of the material. Three ballast types in use by Canadian Pacific (CP) Rail are discussed to demonstrate the influence of petrographic properties on performance. (Edited author abstract). 14 Refs.

B.R. Watters (Univ of Regina, Regina, Sask, Can); Klassen, M.J.; Clifton, A.W. *Transp Res Rec* n 1131 1987 p 45-58.

**088593 SUBGRADE AND BALLAST REQUIREMENTS FOR L25-TON CARS.** The main points relating to the performance of railway track subgrades are outlined. Particular consideration is given to the effect of increasing axle loads from 30 tonnes, standard on 100-ton

cars, to 36 tonnes, estimated as probable for 125-ton cars. Two aspects are discussed, new track construction and upgrading existing track. On existing construction, where subgrade stability is borderline, an appropriate ballast lift to maintain or increase the existing factor of safety may be determined. For new construction, various aspects of subgrade preparation are briefly reviewed. These include the importance of adequate compaction, the treatment of subgrade soils with cement, and the treatment of subgrade soils with lime. Special aspects of dealing with swelling soils or high-sulfate soils, where avoidance is uneconomic, are also mentioned. For existing track on chronically unstable clay subgrades or unstable embankments, consideration should be given to cement or lime slurry pressure injection. (Edited author abstract). 23 Refs.

Raymond, Gerald, P. (Queens Univ, Kingston, Ont, Can). *Transp Res Rec* n 1131 1987 p 64-73.

**088594 TRACK COMPONENTS FOR L25-TON CARS.** Each track component is considered in turn and its engineering development is reviewed. Maintenance equipment is similarly reviewed. Ties and fasteners are identified as items to which an engineered approach could produce significant advances in cost-effective track. A detailed description is then given of the dynamic behavior of ties and how it is influenced by impact loading from equipment. Development of tie design from in-track measurements and the benefits of engineered tie pads are also discussed. Finally, suggestions are given for track for 125-ton cars, and the need to control damage caused by defective wheels is identified. (Author abstract). 23 Refs.

Buckett, John (CXT Systems, Herndon, VA, USA); Firth, Derek; Surtees, John, R. *Transp Res Rec* n 1131 1987 p 74-80.

**088595 RAILROAD TRACK STRUCTURE PERFORMANCE UNDER WHEEL IMPACT LOADING.** Increased use of high-productivity railcars of 100- and 125-ton capacity has pushed current track structure designs to the limit. The higher axle loads result in a tighter load tolerance. The dynamic response of concrete ties and fastener systems to impact loading is quite different from that of traditional wood-tie track. In this paper, results of recent studies of concrete-tie track structural dynamics are discussed in the context of wheel and rail impact loading. These studies include a correlation between the experiments at the Facility for Accelerated Service Testing and revenue traffic load environments, an investigation of Northeast Corridor concrete-tie cracking problems, and recent work on extreme-value wheel loads due to freight car wheel profile geometries. The need for dynamic systems analysis in the design of track structures is emphasized by examples of tie, fastener, and insert response to impact loading. (Edited author abstract). 9 Refs.

**088596 COMPONENT IDENTIFICATION AND INVENTORY OF U.S. ARMY RAILROAD TRACKAGE.** Recognizing the need to effectively plan track maintenance and rehabilitation of the U.S. Army's 3,000 track miles at 81 installations, the U.S. Army, through the Construction Engineering Research Laboratory, has developed a preliminary maintenance management system called RAILER I and is developing an improved system called RAILER II. Both systems define what needs to be managed through component identification and inventory and determine track condition through inspection. In this paper, the track component identification procedures for both systems are explained and the RAILER I system track inventory elements are defined along with a method for field data collection. The fundamental component is a track segment, a relatively uniform portion of track that constitutes the basic management unit. Other components identified are track networks, tracks, turnouts, and curves. Surveyor 100-ft stations are used for locating key component and inventory elements. (Edited author abstract). 3 Refs.

Uzarski, D.R. (US Army Construction Engineering Research Lab, Champaign, IL, USA); Plotkin, E.; Wagers, S.K. *Transp Res Rec* n 1131 1987 p 89-98.

**088597 USE OF GEOSYNTHETICS IN THE DESIGN OF RAILROAD TRACKS.** An innovative approach was used for an Amtrak Northeast Corridor Improvement Project (NECIP) in Boston for track structure support to accommodate low-strength organic clay and high groundwater beneath the railroad tracks. The new track structure uses a combination of geomembranes and geotextiles to maintain groundwater at or near prevailing level to avoid settlement of adjoining structures and provide a dry, stable foundation support for the tracks. This innovative track support system cost only about 40 percent of a pile-supported concrete slab similar to that used in the section of track west of this project. Considerations that led to the combination of a conventional railroad track structure and geosynthetics are described. (Author abstract). 12 Refs.

**088598 DIRECT FIXATION FASTENER-ITS PAST AND ITS FUTURE IN RAPID TRANSIT.** When compared to most other trackwork components, direct fixation fasteners are relatively new products in transit applications at North American transit authorities. In the past, some difficulties have been experienced by procuring operators as well as fastener suppliers in specification compliance and effective part design. With the introduction of newer, more technically advanced direct fixation fasteners at various authorities, a reevaluation of the older style of specifications and testing procedures is necessary to avoid past difficulties and provide a more effective qualified product to the authorities. Past procurement practices and proceedings in general are reviewed with suggestions for possible improvements to balance trackwork and the vibrational requirements in specifications for direct fixation fasteners. (Author abstract). 1 ref.

**088599 REAL TIME DIGITAL PROCESSING OF TRACK IRREGULARITIES IN TIME OF SPEED-UP ON TOKAIDO AND SANYO SHINKANSEN.** To get good riding quality in high speed trains on Shinkansen, it is necessary to manage long wave components of track irregularities from a viewpoint of vehicle dynamics. It is made clear that the data collected by the track inspection car on Shinkansen provide information precise enough over a long wave range up to 100 m. Based on this result, the real time digital processing machine to calculate the track irregularities through riding quality filters aboard the track inspection car has been developed, and it was put into practical use on Tokaido and Sanyo Shinkansen in early 1987 on the occasion of their speed-up to 220 km/h. **088604 CHARACTERISTICS OF LATERAL FORCE ACTING AT GUARD RAIL ON TURNOUT.** The guard rail for a rigid frog in a turnout receives a large lateral force from the inside surface of the wheel and is one of the major factors limiting the train speed in turnouts of narrow gauge lines. To clarify the characteristics of this lateral force, a high-speed running test up to 160 km/h over a guard rail was carried out under fully controlled conditions. Then a computer simulation and a lateral loading test of the guard rail were performed to obtain further information. As a result, the effects of the guided displacement of the wheel, the train speed, the flangeway clearance and the lateral rigidity of the guard rail on the lateral force were ascertained. (Edited author abstract).

**088605 THYSSEN-RANGIERTECHNIK-ENTWICKLUNGSTENDENZEN UND STAND DER TECHNIK.** [Thyssen Shunting Technology - Development Trends and State-of-the-Art]. Most of the European shunting yards are partly mechanized, i.e. equipped with manually controlled primary retarders and drag shoe brakes in the sorting tracks. This leads to inadequate carriage quality and high operating costs. Using fully automated hump yards, carriage quality and economic efficiency can be increased considerably in the system-related shunting of individually loaded wagons. Performance-targeted graded shunting techniques using suitable equipment have proved their value and are available for the shunting yards still existing in the railway network. With several types of controlled retarders, wagon hauling systems and piston retarders for automatic speed control, Thyssen's shunting technology offers solutions in the form

of a complete system. 2 Refs. In German.

**Track Ties** See Also BOLTS AND NUTS—Manufacture.

**088606 CASE FOR CONCRETE TIE TURNOUTS.** It is sufficient to know that for lower maintenance purposes, the design requirements for concrete ties, whether for turnouts or track, depend on the impact loadings generated by wheel tread defects. The Hamersley Iron heavy haul railroad in Australia had this in mind when it decided in 1982 to change out all its timbered turnouts to those secured on prestressed concrete ties. The new installations are the first of their kind in that country and the first to feature fully cast-in shoulders to secure the rail clips. When completed, some 60 1:20 and 1:12 turnouts will serve a 190-mile mainline. The basic motivation for the change to concrete turnouts was cost.

Wesselmann, Carl. *Mod Railroads* v 42 n 10 Oct 1987 p 43-44.

**088607 DESIGN AND MANUFACTURE OF CONCRETE SLEEPERS FOR QUEENSLAND RAILWAYS.** A Contract was let in January 1982 for the manufacture of 500,000 prestressed concrete sleepers at Paget, Mackay. These sleepers are committed to the construction of new branch lines, spurs, and mainline duplications to handle coal traffic from mines being developed by private consortia. Further tenders have been awarded. A track laying machine capable of high productivity in the installation of the permanent way consisting of concrete sleepers and heavy rail is being acquired. These tracks offer strong, economic, low maintenance structures to permit efficient haulage of huge quantities of coal. The paper outlines the procedure adopted for the calling of the first major tender, the assessment of the most suitable Contractor, the establishment of the facility, as well as discussing a typical day's production. (Edited author abstract)

**088608 BETTER TRACK NEEDS BETTER TIE INSPECTION.** Members of the Tie Working Group of the AAR Track Maintenance Research Committee feel strongly that guesswork in tie inspection must be reduced to a minimum. Economical timbering programs start with the implementation of standardized tie counts based upon clear and unambiguous descriptions of what truly constitutes a 'bad' tie. Then when marking ties for removal, special care must be taken to eliminate all clusters of three or more adjacent bad ties.

Roney, M.D. *Railw Track Struct* v 83 n 11 Nov 1987 p 19, 21-23.

**088609 FIRE PROTECTION OF BRIDGE TIES.** The New York City Transit Authority is rendering ties on two bridges in Brooklyn that are resistant to fire by use of NONFLAM. NONFLAM is a patented, emulsified fire retardant. It is essentially an elastomeric polymer which contains fillers and binders. After curing, it becomes a tough, but flexible coating that is weather resistant also. The fillers and binders it contains help hold together all of its components and add strength and longevity during its service life. The approach to NONFLAM application, evolved by the Transit Authority employs a three-man crew, plus a foreman. Two men each handle an application 'wand' - essentially an airless spraying unit. It keeps the material directed where it is needed and minimizes splatter. *Railw Track Struct* v 84 n 2 Feb 1988 p 19, 21-22.

**088610 TRACK: A MATERIAL DIFFERENCE.** In recent years, track engineers' options have expanded and they continue to expand, year by year. But it is perhaps in the cross-tie market that the greatest choice is available-treated wood, concrete (one-piece or dual-block), reconstituted, hard-hard wood, and, for some specialized

applications, steel. So long as wood supplies last and treated wood ties are available at prices that make sense economically, there's no question about the replacement cross-tie that will be dominant: It will be wood. But for special applications, concrete has already penetrated in the U.S. Reconstituted ties had a questionable reputation, but the problems with them have apparently been overcome. Steel cross-tie will continue to be a minor part of the business, but hard-hard wood ties might eventually become widely used.

**088611 DAMAGES IN CONCRETE RAILWAY SLEEPERS IN FINLAND.** Properties of the concrete mix, the production process and the structure of sleepers provided the basis for the examination of damages in railway sleepers. Damaged sleepers have been examined using petrographic, analytical and physical methods. Deterioration process was found to be caused by initial microcracks in the concrete structure. The cracks were formed during production; primarily caused by intensive heat treatment, which due to thermal movement and stresses produces a strong formation of microfissures and forms unstable chemical compounds in the concrete. Once the pattern of damage was established, the manufacture of concrete sleepers was changed to the extent of abandoning heat treatment. (Edited author abstract) 2 refs.

## Air Conditioning

**088615 OUTLINE OF LARGE SCALE CLIMATE TESTING FACILITIES FOR ROLLING STOCK.**

With a view to developing high-performance rolling stock, making the most use of the latest technologies, the author's firm is equipped with climate testing facilities capable of verifying the performance of air-conditioning centering on ventilation and cooling/heating functions under every conceivable climatic condition. These facilities are designed so as to house an entire coach completely for research and development of performance of air-conditioning equipment and of heat insulation of entire coach body as well as for attainment of quality assurance of the coach. An outline of these climate testing facilities is presented.

**088616 DRUCKERTUECHTIGTE REISEZUGWAGEN FUER NEUBAUSTRECKEN: GRUNDLAGEN, LOESUNGEN FUER KLIMAAANLAGEN.** [Pressure-Tight Passenger Coaches for New Lines. Fundamentals and Possible Solutions for Air-Conditioning Systems]. High-amplitude fluctuations of air pressure occur in railway tunnels which are passed through at high speed. These pressure fluctuations cause great annoyance to the passengers and train staff. This article describes the behaviour of the air pressure inside a passenger coach in response to external pressure fluctuations. As a consequence, measures for protection against the effects of pressure fluctuations are required. Such measures are to prevent the annoying effect of pressure fluctuations inside a coach. Possible ways of measuring and evaluating the effectiveness of the protection system are described. The paper also deals with the fundamental technical solutions available for equipping the air-conditioning system of passenger coaches with a protection against pressure fluctuations. The system chosen for the German Federal Railway rolling stock is described. (Edited author abstract) 6 refs. In German.

## Axles

**088617 LAGERUNGSKONZEPTION UND WERKSTOFFE FUER RADSATZLAGER IN MODERNEN LAUFWERKEN VON HOCHGESCHWINDIGKEITS-UND NAHVERKEHRSFAHRZEUGEN.** [Bearing System Concept and Materials for Axle Bearings in Modern Bogies for High-Speed and Suburban Rolling Stock]. Extensive fundamental investigations were necessary to develop an appropriate bearing system concept for high-speed traffic. A Type TBU tapered roller bearing assembly proved to be the most suitable axle bearing for high-speed duty. Its friction torque characteristic is significantly lower than that of cylindrical roller bearings and self-aligning roller bearings. The axle bearing housings of advanced rail vehicles may consist of light alloy or nodular iron castings. In addition, 'Germanite', a high-strength bainitic nodular cast iron is available for this purpose. In suburban traffic, new light-weight cylindrical roller bearings are being introduced. This saves weight and enables the use of smaller size housings. The bearing reliability is improved by the use of a plastic cage as could be proved in hot box model tests. Moreover, in the case of cylindrical roller bearings, the plastic cage features easier maintenance than the brass cage so far used and is therefore being applied to an ever-increasing extent in suburban and main line vehicles. In bearings of standard design, the polyamide cage has proved successful in millions of applications. (Edited author abstract) 23 refs. In German.

**088621 EXPERIMENTE ZUR SPURFUEHRUNG.** [Experiments on Wheel-Rail Guidance]. New findings have been revealed by comparative investigations on an experimental running gear designed for operation as a two-bogie unit with individually driven wheels or as a two-bogie unit with axle drive and a conventional type MD 42 bogie. The tests have confirmed considerations and calculations according to which individually driven wheels ensure better guidance than conventional wheelsets. As a result of a systematic approach to the experiments, the prevailing concepts concerning the guidance mechanism has to be corrected in at least two respects: the top speed limit for the wheel/rail system - if existing at all - is above 500 km/h; and the amount of energy converted in the wheel-to-rail contact, the wheel wear, the track wear and obviously also the rolling noise can be substantially reduced by the use of individually driven wheels. Running gears with individually driven wheels can be built at minimum cost, as shown by the example of the two-bogie unit with individually driven wheels. (Edited author abstract) 6 refs. In German.

**088622 WEITERENTWICKELTE GUETERWAGEN-DREHGESTELLE DER DEUTSCHEN BUNDESBahn FUER 22,5 t RADSATZLAST - WIEDER NACH DEM LENKACHSPRINZIP.** [German Federal Railway's Improved Freight Car Bogies for 22.5-Ton Axle Load Retain the Principle of Radial Axle Adjustment]. About 10 years ago, German Federal Railway placed new production-type bogies for Class 665 into service. Despite good experience and low maintenance costs, a thorough modification became necessary in order to improve the cost effectiveness and to match the brake to the more severe demands due to higher speeds at an axle load of 22.5 t. Well-proven components, such as the standard wheelset for an axle load of 22.5 t, the parabolic spring and many parts of the link suspension and brake rigging, have been retained. Radial axle adjustment, featuring minimum track stressing especially on routes with many curves, was

also retained. The new bogies have meanwhile been internationally adopted as standard equipment together with the reinforced Y 25 L bogies. (Edited author abstract) 20 refs. In German.

**088624 NEUE ERKENNTNISSE UEBER DAS VERSCHLEISSVERHALTEN VON GUETERWAGENDREHGESTELLEN.** [New Findings Concerning the Wear Behavior of Freight Car Bogies]. The wear characteristics of the wheel/rail system are an essential criterion in assessing existing or new bogie designs. Based on test results obtained on roller rigs, a model is developed for estimating the loss of material to be expected at the wheel-rail interface. The wear behavior of the three basic car bogie designs is illustrated by the examples of the Y 25 rigid-axle bogie of the French National Railways, the type 665 steerable-axle bogie of the German Federal Railway (DB), and the cross-anchor bogie of South African Transport Service (SATS). The Y 25 rigid-axle bogie proves to be particularly unfavorable in terms of wheel and rail wear. There is little difference between DB's steerable-axle bogie 665 and the SATS cross-anchor bogie. On the whole, the cross-anchor bogie shows better performance with regard to the amount of material loss due to wear and the loss of material as a function of the wheel profile. **088625 PRUEFUNG VON DREHGESTELLRAHMEN FUER REISEZUGWAGEN NACH DEM UIC-MERKBLATT 515 VE.** [Testing of Bogie Frames for Passenger Cars According to UIC Leaflet 515 VE]. Appendix 4 of UIC Leaflet 515, relating to the testing of bogie frames, has been revised in order to meet the requirements for up-to-date design of bogies and to cover the possibilities nowadays available in the field of proof testing. Based on experience made available by a few European railways, the leaflet specifies the procedures for proving the ability of the frames to resist plastic deformation at abnormal loads and the fatigue strength of this highly and intricately stressed component. The ability to withstand plastic deformation is proved by a static test during which exceptionally high forces are simultaneously applied to the frame in the vertical and lateral directions. The fatigue strength is proved by static simulation of dynamic service conditions and by means of the fatigue test. With static simulation, the most important force combinations arising during service are compared in a manner enabling the stresses measured to be analyzed with the aid of fatigue strength diagrams. The force combinations are the conclusive extract from the cumulative operating stress endured during a period of 30 years. The fatigue strength of the bogie frame can be experimentally verified within a period of two to three months by repeated application of the cyclically varying quasi-static and dynamic force components. All three tests are

required for proving the cyclic strength and thus form an integrated test program. (Edited author abstract) In German. 7 refs.

**088629** LASTKOLLEKTIVE FUER EISENBAHN-RADSATZLAGERGEHAUSE. [Service Loading Combinations for Railway Axlebox Housings]. Service loading combinations are an important prerequisite for the effective use of finite-element programs in the design of railway axle-box housings. Since the rail system is not in a homogeneous condition, a variety of loading combinations are derived to cover the external influences in an optimum manner. This is done by describing the track conditions in subnetworks as precisely as possible and by evaluating the data by mathematical modelling of equivalent systems representing the track-vehicle system. To calculate the loading combinations, the operating conditions, the magnitude and sequence of the operating loads and the damage accumulation hypotheses must be taken into consideration. The latter are also used to determine the remaining life of the axle-box housings. The individual loading combinations are mixed according to the probability of their occurrence to form the global service loading combination. Apart from being clearly organized, this method of deriving the global service loading combination offers the benefit of modelling any desired track system by combining and weighting stored or standardized loading combinations of subnetworks. **088631** BEHAVIOR OF PHOSPHIDE EUTECTIC IN CAST IRON AT THE WORKING TEMPERATURE OF BRAKE SHOES. The consumption of cast iron brake shoes in rail transport systems can be reduced by prolonging their useful life. The most promising way of enhancing the performance of cast iron is to alloy it with phosphorus. The wear resistance and friction properties of the shoes will depend on the amount and properties of the phosphide eutectic. A study has been made of the structure and properties of the phosphide eutectic in cast iron at the working temperature of the brake shoes in railroad rolling stock. Examinations of the surface layers on high-phosphorus iron specimens have shown that the phosphide eutectic plays a significant part in the formation of brake shoe surfaces. Due to the presence of both phosphides and phosphates, the surface layer acquires phenomenal properties, including superior flowability, seizure resistance and resilience, which contribute towards high friction properties and wear resistance.

**088634** HIGH SPEED FRICTION CHARACTERISTICS OF METALLIC MATERIALS FOR BRAKE DISCS. Cladding materials, forged steel, etc., have been proposed as new brake disc materials, because their resistance to thermal crack propagation is higher than that of conventional disc materials, and they can be used with high-speed rolling stock. Past investigations have confirmed that they possess high resistance to thermal crack propagation. In this paper, their friction and wear characteristics, as determined in high-speed friction tests of the linings used with the SHINKANSEN vehicles, are reported. It is concluded that the influence of the graphite

shape in cast iron on the friction and wear characteristics is negligible; cladding materials are useful to improve the total performance of brake discs; and the friction and wear characteristics of forged steel are different from those of cast iron. (Edited author abstract) 2 refs.

**088636** DEVELOPMENT OF COMPOSITE MATERIAL TO SUIT THE RAILWAY APPLICATIONS. It is believed that most of the problems encountered in railway systems and wheel failures are due to the use of cast-iron brake linings. In this paper, new formulations of molded asbestos composites adequate for railway brake shoes are proposed. The new formulations consist mainly of fiber asbestos (chrysotil type) phenolic formaldehyde resin and other additives to moderate the tribological properties of the formulations. The proposed new composite materials were prepared and then tested to evaluate their mechanical and tribological properties. A great number of specimens were tested to allow the performance of statistical analysis. The aim of this statistical study is to control the preparation of the proposed formulations to obtain the least deviation from the standard mean. (Edited author abstract) 12 refs.

**088642 DIE DYNAMIK BEIM BREMSEN SCHNELLFAHRENDER REISEZUEGE.** [Braking Dynamics of High-speed Passenger Trains]. Vehicles for international use within Europe are equipped with compatible automatic air brakes. Location of the controller at the air supply point means that no separate energy supply or control is required on the vehicle, but the effectively long line of flow of the control signal prohibits the

application of brakes simultaneously throughout the length of the train. Consequently, there is congestion and strain in the system and a need for extra braking as train length increases. With so-called braking accelerators these drawbacks can be alleviated, and, as is generally known, they can be avoided altogether with electropneumatic control, at the cost of extra equipment for the purpose. With correct coupling to the electric brakes on the locomotives all vehicles can be made to brake simultaneously and with similar retarding characteristics. (Author abstract). 10 Refs. In German.

**088643 DIE EP-BREMSE-NICHT NUR EIN BAUS-TEIN DES NOTBREMSEUEBERBRUECKUNG-SKONZEPTES.** [Electropneumatic Brake - Not Just a Component of a Standby Automatic Brake]. Following a brief discussion of the systems for direct and indirect control of the electropneumatic (EP) brake, the basic arrangement and mode of operation of the German Federal Railway's indirect system for control of the EP brake are described in detail. Mention is made of its characteristic features compared to a purely pneumatic brake. Owing to the completely uniform response of the brakes all the way down the train, no slack action develops while the brakes are being applied or released even on trains with the most adverse coupling conditions. On the basis of comprehensive tests on level track and gradients, the brake department of the railway's research institute at Minden determined a number of properties of the indirectly controlled EP brake. The EP brake operates in very fine steps and at a uniform and precisely adjustable rate. Accurate target braking is possible even for long passenger trains. Short application and release times are attainable with the EP brake without loss in riding comfort. To operate the indirect acting EP brake, the driver does not have to accustom himself to new conditions. Accurate target braking is possible right away. (Edited author abstract). 4 Refs. In German.

**088644 DIMENSIONIERUNG UND VERGLEICH-BARKEIT VON SCHWUNGMASSEN - REIBUNG-SPRUEFFSTAENDEN.** [Dimensioning and Comparing Inertia Type Brake Dynamometers]. In the course of modernizing the test equipment installed in the brake department of the German Federal Railway's testing institute at Minden, the existing large brake dynamometer was equipped with an electronic inertia simulator at the end of 1987. The paper covers the physical relationships characterizing the operation of inertia-type dynamometers from idling to retarding braking with electronic inertia simulation and compares the results of recent performance tests. The comparability of the test results obtained with different types of inertia-type brake dynamometers is discussed as well. (Edited author abstract). In German.

**088648 MIKROCOMPUTER-ANTRIEBSS-TEUERUNG FUER ICE.** [Microcomputer Traction Control for Intercity Expresses]. The SIBAS-16 microcom-puter control system for railway vehicles has hitherto been primarily targeted toward local services. It has proved itself well able to cope with all present-day traction needs such as dc current supplies and controls. The traction control apparatus of the ICE is the first application of SIBAS-16 techniques to a traction system with four-quadrant working, voltage regulation, and variable-frequency operation. The modular structure of the hardware and software is retained, and the expenditure on electronics is expected to be reduced by 40 percent compared with existing techniques. ## Deformation

**088649 FESTIGKEIT VON REISEZUGWAGEN-DAECHERN URSACHEN DER BEI SERIENWA-GEN DER BAUART BPMZ 291 AUFGETRETENEN VERFORMUNGEN IM DACHBEREICH TEIL 1.** [Strength of Passenger Coach Roofs. I. Causes of the Roof Deformations Occurring in Coaches of the Bpmz 291 Series]. From 1981 until 1986, a total number of 500 second-class Bpmz 291 open-style coaches were purchased. During service, abnormal damage (undulations) occurred in the roof above the fourth window near the middle of the coach, partly in localized areas, but in most cases extending across the entire section. Damage of this kind was detected for the first time in September 1985, but has meanwhile been experienced on about 35 percent of all

coaches. It can be concluded from the uniform appearance of the defects experienced and still being experienced that the roof structure is subjected to excessive compressive forces which, in conjunction with superimposed oscillations, cause buckling of the filigree type beaded sheet material. Neither abnormally high stresses due to the service conditions nor inadequate dimensioning of the body structure, consisting of a vertically loaded beam resting on two supports with cantilevers, can be ruled out as the cause of the failures. To investigate the mechanism of the unprecedented, frequent failures and to identify their probable cause, the loading conditions were simulated on adequately sized compression test specimens. As expected, it was thus possible to reproduce the kind and scope of the failures in accordance with the original event. Using different plate dimensions (bead spacing, plate thickness, transition radius) and materials, it was experimentally confirmed that optimized dimensions will result in a considerably higher safety against failure not only for larger but also for smaller roof sections. (Edited author abstract) In German.

**088650 NEUE DOPPELTRIEBWAGEN MIT ADHAESIONS- UND ZAHNRADANTRIEB FUER DIE BAYERISCHE ZUGSPITZBAHN.** [New Rack-Rail Twin Self-Propelled Units for the Bayerische Zugspitzbahn]. The Zugspitze, the highest mountain in West Germany (2966 m), is reached by a meter-gauge rack-railway, which is operated by the Bayerische Zugspitzbahn. Services are, in part, still made up of the original rolling stock built in 1930. To retire these maintenance-intensive coaches, but primarily to improve the timetable and to shorten the journey time, it was decided to purchase new coaches. The rolling stock to be procured will consist of short-coupled twin sets for rack-rail operation. The two car bodies of lightweight steel construction are supported on four identical bogies, each of which is equipped with a downhill driving axle and an uphill carrying axle. The gearing can be changed over for the adhesion or rack mode. The electrical equipment includes freon-cooled dc choppers and a microcomputer-based system for control functions. The braking equipment, comprising five braking systems, is specifically designed to meet the requirements of the rack mode. The safety equipment accounts for the complicated conditions resulting from two different modes of operation and two rack sections with different top speeds. The vehicles are still under construction and have been scheduled to be placed in service in mid-1987. (Edited author abstract) In German.

**088651 NEUE INTERCITY-WENDEZUEGE FUER DEN VERKEHR ZWISCHEN DEN NIEDERLANDEN UND BELGIEN.** [New Intercity Push-Pull Trainsets for Service Between the Netherlands and Belgium]. Both the Belgian Railways (SNCB) and the Netherlands Railways (NS) have decided to replace their old push-pull sets operating on the heavily worked line between Amsterdam and Brussels by new ones. SNCB has ordered 12 Class 11 dual-voltage locomotives and Netherlands Railways' order for 59 passenger coaches includes 11 driving trailers. This paper covers the mechanical equipment of the locomotive and contains a particularly comprehensive description of the electrical equipment which is partly required to meet very exacting requirements such as, for instance, regarding the maximum permissible rms value of the harmonic currents in both networks. The passenger coaches and driving trailers are described in great detail by referring to the plan views and to all components, such as unfinished car bodies, large capacity compartments, kitchen facilities, telephone box, running gear, brakes, heating and ventilation systems and power supply. (Edited author abstract) In German.

**088652 DIE NEUE GENERATION VON HOCHGESCHWINDIGKEITSZUEGEN DER SNCF - DIE FAHRZUEGE FUER DIE STRETKE TGV ATLANTIQUE.** [New Generation of High-Speed Trains of the SNCF Rolling Stock for the TGV Atlantic Line]. For its new high-speed TGV Atlantic line, the SNCF has developed modified versions of the present TGV Sud-Est sets. A wide range of fundamental features has been retained, especially in the field of safety. New items include the use of three-phase synchronous traction motors, heavy-duty anti-lock disc brakes with microprocessor control, and an improved pantograph for 300 km/h running. Interior comfort has been enhanced considerably. (Author abstract) In German.

Lacote, Francois (SNCF, Paris, Fr). *Elektr Bahnen* v 85 n 7 1987 p 227-234.

**088653 NETWORK ROLLS OUT WESSEX ELECTRICS.** The new five-car Class 442 EMU's are to be used for the London-Weymouth service upon completion of the Bournemouth-Weymouth electrification in May 1988. Based on the successful MkIII coaches developed in the early 1970s, the Class 442s have full air-conditioning and a combination of face-to-face and face-to-back seating. The first Southern Region units designed for 160 km/h, they have 23 m car bodies against the former standard of 20 m. To keep down the £37 m cost of the 24 sets, they use 750 V dc traction motors and camshaft resistance switching recycled from the 1966 built Class 432 sets which they are replacing.

**088655 SHUTTLE BIDDERS FACE TECHNICAL CHALLENGE.** Designing wagons to carry cars, buses and lorries under the English Channel at 160 km/h presents formidable problems; critical components will be prototyped to ensure that fire hardness and environmental standards can be met. The need for a number of detail changes has emerged since conceptual designs were prepared in 1986. The largest passenger-carrying rail vehicles ever built (in terms of gross volume) are now to be even bigger, with the width of the single-deck tourist shuttles increased by 100 mm to 4.1 m. Gone are the picture windows, banished by the need for shuttle wagons to contain a fire for 30 min - long enough for a train to clear the Tunnel and enter a special emergency siding at either terminal. They are replaced by armored glass 'portholes'. A major change is the decision to standardize platform height at 1 050 m above rail, instead of having alternate high and low platforms for the double-deck shuttles. This has led to a need to alter the design of the double-deck shuttles. The single-deck tourist shuttle loading wagons are also different with half the length of the wagon being covered by telescopic sliding hoods.

**088656 DAS KONZEPT INTERCITY - EXPRESS ALS SYSTEMKOMPONENTE EINES KUENFTIGEN HOCHGESCHWINDIGKEITSVERKEHRS.**

[Intercity Express As a System Component of a Future High-Speed Transport Network]. With the procurement of the electrically powered trainsets, following the end of the project planning phase for a normal production train, the Intercity Express (ICE) project is now on the verge of implementation. A wide spectrum of products and facilities, based on faster and more comfortable trains, such as Intercity (IC), Euro-City (EC) and Interregio (IR), and linked to the future ICE lines, is intended to strengthen the position of Deutsche Bundesbahn in the transport market. This paper describes the requirements to be met by the new generation of vehicles due to the extensive test program performed with the Intercity Experimental and gives a look at possible applications of the ICE technology in high-speed freight traffic and in the form of an 'IC-Europa' in a future European high-speed network. (Edited author abstract) 5 refs. In German.

**088657 HOCHGESCHWINDIGKEITZUG X2 FUER DIE SCHWEDISCHEN STAATSBAHNEN.** [X2 High-Speed Train for Swedish State Railways]. Swedish State Railways have planned a high-speed network which can be reached via short links by 70% of the Swedish population and will be fully operational in 1993. An order for 20 six-car trainsets of Class X2 was placed with Asea Traction. The trainsets, equipped with high-performance ac drives, bogies with 'resilient' axle adjustment and an active body tilt control system, can negotiate curves at a 30% higher speed. Journey times on the Swedish network lines with many curves can thus be shortened by up to 25% without making any changes to the permanent way. This paper describes the background of the high-speed project, the concept of the new train, the design of the mechanical and electrical equipment, as well as the control systems of the power car and the coaches. (Edited author abstract) In German.

**088659 LOESUNGSKONZEPTIONEN FUER PERSONENUEBERGAENGE UND EINSTIEGSTUEREN IN DRUCKTUECHTIGEN REISEZUEGEN DES HOCHGESCHWINDIGKEITSVERKEHRS.** [Concepts for Corridor Connections and Doors in Pressure-Tight High-Speed Passenger Trains]. The rolling stock for the planned high-speed passenger traffic on the German Federal Railway's new lines with high proportions of tunnels must be pressure-tight to a certain extent. This includes pressure tight corridor connections between the cars and pressure-tight passenger doors. Both components had to be newly developed. While different technical solutions were obtained for the corridor connections on the permanently coupled Intercity Express (ICE) trainsets with power cars at the ends and on the UIC-compatible passenger coaches, which can be grouped in a variety of configurations, the design concepts for the passenger doors are universally applicable. The solutions adopted by the railway are described. (Edited author abstract) 5 refs. In German.

**088661 EASTERN OPERATORS EYE BI-LEVELS.** Double-deck commuter coaches are about to reappear in the eastern U.S. The Long Island Rail Road has placed an order for a dozen prototype locomotive-hauled bi-level coaches. LIRR's double-deckers, capable of seating 180 riders vs 120 on standard coaches, will go into test service in the fall of 1990 on the railroad's Port Jefferson branch. Not long after LIRR places its prototype order, the Massachusetts Bay Transportation Authority plans to issue an RFQ for 60 to 100 locomotive-hauled bi-levels to serve Boston area commuters. An interested bystander will be New Jersey Transit Rail Operations, which later this year may take its first steps toward acquiring around 50 bi-levels. Bi-level cars are already being successfully used on commuter lines out of Chicago and San Francisco.

**088662 DER NEUR KLIMATISIERTE ABTEIL-/GROSSRAUM-REISEZUGWAGEN 2. KLASSE DER DEUTSCHEN BUNDESBahn.** [German Federal Railway's New Air-Conditioned Second-Class Compartment/Saloon Coach]. Since 1981, a new concept for the interior design of a compartment vehicle has been developed as part of a program for air-conditioning the second-class rolling stock for intercity services. The developing and building of prototypes for a 26.4-meter long compartment coach, having a total of 64 seats, with conventional compartments and saloon-type compartments at mid-span of the vehicle were started in 1986, using the design of the existing air-conditioned second-class saloon coach as a basis. The interior fittings include new, reclining seats with a glass-reinforced plastic shell. Each seat has a folding table integrated into the arm rest. The seats are arranged in groups of six, four and two and as single seats. New luggage racks and lots of glass are characteristic features of the new interior design. To make the vehicles airtight when passing or entering tunnels on newly built lines, new corridor connections, end doors, passenger doors, retention toilets, an upgraded air-conditioning system with pressure ventilators and pressure valves as well as airtight windows and a reinforced car body were developed. (Edited author abstract). In German.

**088663 RIC-GROSSRAUMWAGEN FUER DIE DEUTSCHE REICHSBAHN.** [RIC Saloon Coaches for Deutsche Reichsbahn]. The commission to develop and build 10 first and second class saloon coaches has enabled VEB Wagonbau, Bautzen, to produce and put into service passenger coaches which meet the steadily growing international demands for higher comfort and higher speeds. Prompted by the development of these coaches, the subcontractors attended to a number of development problems and took the necessary steps to implement series production. All efforts were planned to make new assemblies and equipment available for all future versions of the new train. The assemblies and the two types of saloon coaches are briefly described. The 10-coach train was subjected to comprehensive tests and trial runs and placed in regular service in the Deutsche Reichsbahn network in January 1986. The train has so far been running on the Berlin-Rostock and Berlin-Prague routes and will also be

used for service between Dresden and Berlin. (Edited author abstract). In German.

## Economics

**088666 EINKAUF VON SCHIENENFAHRZEUGEN - KONTINUITAET UND WANDEL IN DER BESCHAFFUNGSPOLITIK DER DEUTSCHEN BUNDESBahn.** [Purchasing Railway Rolling Stock. Continuity and Changes in the Purchasing Policy of the German Federal Railway]. Against the background of the 'DB 90' corporate strategy, which is aimed at an improvement of the economic situation of the German Federal Railway, the impact of purchasing-related services and costs on corporate success is gaining in significance to an ever increasing extent. Changes are bound to occur in the activities of the railway's purchasing departments both internally right from the start of the planning phase of an investment and externally in dealing with outside vendors. To improve productivity during the implementation of the 'DB 90' program, investment efforts must focus on fields where corporate success is to be expected in the medium and long term. The innovation in the purchasing sector manifests itself in the efforts made by the purchasing departments to activate the known and latent innovation potential of the market for the railway on a competitive basis, thus offering the most cost-effective solution to the operating units responsible for providing and selling the railway's services. (Edited author abstract). 2 Refs. In German.

Gemeinhardt, Wolfgang (Deutschen Bundesbahn, Frankfurt am Main, West Ger). *Z Eisenbahnwes Verkehrstech Glasers Ann* v 112 n 5 May 1988 p 159-162.

**088667 ENERGIEKOSTEN UND VERWENDUNG VON TRIEBFAHRZEUGEN IM NAHVERKEHR.** [Energy Costs and Use of Tractive Units in Short-Distance Traffic]. The Italian State Railways operate short-distance traffic on lines with heavy and light traffic. They use long train sets with locomotives of high performance and diesel and electric multiple units. Locomotives of class E 646 and E 424 and multiple units of class ALn 801, ALn 724 and ALn 668 and 663 are used for this purpose. On lines with heavy traffic the trend at present is toward an increase in comfort and a reduction in travel time. As criteria for decision-making the authors introduce the specific parameters of performance in kWh/seat, vehicle weight in t/seat, and energy consumption in kWh/seat. The kWh/seat ratio should have a value of 3 to 4. (Edited author abstract). In German.

Franchi, Riccardo (Ente Ferrovie Dello Stato, Florence, Italy); Zecchi, Ruggero. *Elektr Bahnen* v 86 n 8 Aug 1988 p 244-248.

## Electric Drive

**088668 L'AZIONAMENTO ELETTRICO DELLE MOTRICI DEL TRENO AD ALTA VELOCITA ETR 500 DELLE FERROVIE DELLO STATO.** [Electric Drive of the Power Cars for the Italian State Railroads High-Speed Train ETR 500]. After recalling the main performances and characteristics required by the FS for the high-speed train ETR 500, an illustration is given of the choices made in deciding the electric drive for the power cars. In the first place, the choice of the three-phase drive technique, which makes it possible to obtain the greatest specific power in the traction motors, an optimal exploitation of adhesion, high flexibility is illustrated. The type of three-phase drive is with voltage inverter and three-phase asynchronous motors, with a choice which favors the optimization of the motors and running dynamics, at the cost of a greater complexity of the converter and regulation, liable, however, to considerable simplification with the envisaged subsequent introduction of GTO converters and new control techniques with microprocessors. (Edited author abstract) In Italian.

**088669 L'EQUIPAGGIAMENTO ELETTRICO DEL TRENO ETR 500 PER IL SISTEMA AD ALTA VELOCITA DELLE FS.** [Electric Equipment of the ETR 500 Train for the FS (Italian State Railroads) High-Speed System]. A description is given in the article of the main characteristics of the electrical equipment of the ETR 500. In particular, examination is made of the traction drive and the choices made for the definition of the auxiliary services which form an integrated electrical system between the power and trailer units. Another important aspect developed for the ETR 500 is the system of remote control and automation of the train which permits the centralized control of all the train equipment with a high degree of reliability; lastly the problem of the diagnostics of the equipment and relative supervision system is dealt with. In Italian.

## Fire Protection

**088670 FIRE PROTECTION ON TRAINS.** The hazards from fire in a moving vehicle are similar to the hazards from fire in a building and similar steps must be taken to detect the presence of fire, to prevent it from spreading and to extinguish it in this special circumstance. This paper describes the different methods that can be used to provide an effective fire protection system from trains. The various system requirements are set out and a selection is made of the type of system required and the equipment needed to perform each task. Each element of the system, consisting of detection, control and monitoring and extinguishment, is dealt with separately and its

advantages and disadvantages are given. Finally, an assessment is made of the applications of the system, and reliability, testing, maintenance and safety features are discussed. (Edited author abstract)

**088672 INVESTIGATION INTO THE STATE OF ADHESION BETWEEN RAILS AND WHEELS BY SLIPPING ADHESION TEST TRUCK.** Quantitative analysis of the phenomena of adhesion between the rails and wheels is essential to properly control the behavior of rolling stock. Therefore, a number of investigations have been carried out in many countries. However, most of these investigations have been made in laboratory rooms, the rate of slipping has been mostly within the minute range of creep, and the data obtained in them have not necessarily been in good compatibility with those of field tests. In view of this situation, the author designed and constructed a test truck based on an entirely new idea, and ran a passenger car equipped with this special truck on a test track in the JR Omiya Factory. Although the test distance was not long, the real state of the adhesion, which changes continuously along the direction of the rails, was clearly reproduced. (Edited author abstract). 6 Refs.

**Inspection**

**088673 DIAGNOSETECHNIK UND IHRE BEDEUTUNG FUER DIE DEUTSCHE BUNDESBAHN.** [Diagnostic Techniques and Their Significance to the German Federal Railway]. Diagnostics can be useful in all fields of a railway enterprise that are concerned with the operation and handling of vehicles and stationary equipment. On-line diagnostic systems (internal diagnostics) permanently installed in the object to be diagnosed provide up-to-date information for the operating and maintenance staff, with plain-text displays and matching operator's controls serving as man-machine interfaces. Automatic self-diagnosis can be implemented as a convenient variant of the internal diagnostics by the use of microprocessors. Utilizing such a diagnostic system and integrating it into the vehicle structure, operating concept and maintenance strategy is a goal of both the German Federal Railway and international standardization efforts within the UIC. (Edited author abstract) In German.

**088674 DIAGNOSE BEI LOKOMOTIVEN UND TRIEBWAGEN IM FERN- UND NAHVERKEHR.** [Diagnostics for Locomotives and Trains for Long-Distance and Short-Distance Traffic]. The components of modern rail vehicles have become very complex in order to be capable of meeting the requirements with respect to safety, comfort and cost effectiveness. A significant step towards achieving the inherent goal of automatic failure diagnostics has been made possible by the use of novel digital data processing techniques. The possibilities for failure analysis increase with the amount of useful information available. For this reason, development is proceeding in the direction of distributed processing units which

are linked to a central fault memory by a bus system. Special events along with the necessary commands are presented to the driver on a display unit and are stored in nonvolatile read-write memories for the purpose of preventive maintenance. Data are evaluated by means of small visual display units, printers, recorders or PCs, enabling trained staff to identify the root causes within a short time. This development will eventually lead to wireless condition monitoring on a routine basis with storage of the results in a fully computerized data base. (Edited author abstract) In German. 3 refs.

**Light Weight**

**088675 TRENDS IN WEIGHT REDUCTION OF ROLLING STOCK.** From the viewpoint of economical management, passenger car weight reduction is now an important theme of railway engineers in Japan. In this paper new technologies recently developed for weight reduction are described. For example, some new technologies concerned with improved aluminum alloy or stainless steel car bodies and bolsterless trucks are explained. In addition, weight reduction of passenger car seats, truck frames and wheel axles is mentioned. (Edited author abstract)

**Magnetic Levitation**

**088677 MAGLEV APPROACHES TOWARD PRACTICAL USE.** In 1970 Japanese National Railways began the development of a magnetic levitation transport system using superconducting magnets. In December 1979, a laboratory vehicle, the ML 502 attained a maximum speed of 517 km/h. Since 1980, numerous tests, such as multiple-unit operation, manned operation, and operation on a guideway with irregularities, have been carried out by the MLV001 vehicle with satisfactory results. This led to the construction of a prototype vehicle, the MLV002, which is described in this paper, as well as a circulating-current-type cycloconverter and a maglev system passenger transportation plan.

Tanaka, Hisashi (Railway Technical Research Inst, Jpn). *Jpn Railw Eng* v 27 n 1 Jun 1987 p 2-6.

**088678 DEVELOPMENT OF PERSISTENT-CURRENT SWITCH.** This paper presents an experimental persistent-current switch for superconducting coils of Maglev cars. The persistent-current switches, of which off-on operation is an alternation between normal state and superconducting state of a superconducting wire effected by heating and cooling, are attached to the ends of the superconducting coils of Maglev cars. To develop a light-mass and small-size persistent-current switch the on-state of which can be supplied with a large electric current while the off-state is given a high electric resistance. The author and his colleagues at the Maglev Laboratory designed and experimentally manufactured a switch consisting of 10 slender switch elements connected in parallel. Its mass was about 4kg, the current capacity being over 700A, and the off-state resistance about 100Ω.

**088679 ANALYSIS METHOD OF MAINTENANCE DATA IN ROLLING STOCK RELIABILITY ADMINISTRATION - RELIABILITY ESTIMATION FROM RANDOMLY LEFT TRUNCATED AND RIGHT CENSORED DATA IN RESTORATION-RENEWAL PROCESS.** To evaluate and reconstruct a rolling stock maintenance system, it is necessary to know the reliability of the rolling stock and/or its equipment. Statistical analysis of field maintenance data is a powerful tool for reliability estimation, but two methodological problems must be solved in order to perform such an analysis. One is the data incompleteness, due to observation during a limited period. The other is a failure-mixture situation where in case of failure the equipment is renewed or partially repaired to be used again. In this paper, a maximum likelihood estimation method is proposed for analyzing these kinds of data. Assuming a Weibull lifetime distribution, the estimation error of this method is evaluated by Monte Carlo simulation. A modified version of the Kaplan-Meier estimate and the hazard plotting method for the same data is also developed. (Edited author abstract) 5 refs.

**Materials**

**088681 PASSENGER TRAINS.** Recent years have seen an upsurge in the development of new materials for use in passenger trains. These developments have taken place in three principal areas: bogie materials; materials for surface finishing; and, materials for cab and coach components. Performance, cost-effectiveness and, above all, safety are key factors in specifying new materials for surface and underground passenger trains. This article discusses cost problems, forgings and composites, and high-performance paints.

### Pressure Measurement

**088684** COMPRESSIBLE AND LEAKY TRAINS IN TUNNELS. It is hypothesized that phase differences commonly observed between computed and measured pressure histories in railway tunnels may be caused in part by reduced acoustic wave speeds in the annular regions of flow alongside trains. Such reductions in wave speed are shown to be a possible consequence of the compressibility of trains and/or the leakage of air into and out of trains. These effects are shown to be capable in principle of reducing the effective wave speed. (Edited author abstract) 8 refs.

### Protective Coatings

**088685** ELASTOMERIC LININGS IN TANK CARS FOR CORROSIVE SERVICE. Rubber lining has been used for severe corrosion protection in tank cars for the past 45 to 50 years. Rubber properties, along with low durometer hardness, are essential for the performance of a corrosion protection system in a tank car. The chemical resistance and ability to withstand physical movement make rubber linings the ideal corrosion protection for the interiors of many tank cars. Of equal importance is the application of these materials to the steel tank car interiors. The rubber lining must be permanently vulcanized to the tank car interior with no leaks through the lining to the steel.

### Stability

**088687** EXPERIMENTAL STUDY OF RAILWAY TRUCK DYNAMICS USING A ROLLING STOCK TEST APPARATUS. In order to clarify the hunting stability of railway trucks, a rolling stock test apparatus has been constructed. Several kinds of high speed trucks have been tested in the course of development of an advanced Shinkansen truck. A detailed description of the test procedure, typical test results, and the correlation with linear/nonlinear analysis is provided in the present paper. Through the experimental and analytical study, it has been clarified that we can properly investigate truck hunting behavior by using this apparatus and that the nonlinear analysis can give a quantitative explanation. (Author abstract) In Japanese. 8 refs.

### Stresses

**088689** RADIAL AXLE FREIGHT CAR TRUCKS GENERATE SAVINGS. The standard (conventional or three-piece) truck holds two wheel sets parallel to each other and provides no mechanism to steer the wheels around curves. The wheels, therefore, approach a curve at a large angle of attack forcing the flange (the raised guiding edge) of a steel wheel against the rail and producing lateral force on the rail. The problem associated with conventional rail-car trucks have inspired the search over many years for an improved truck that would reduce wheel and rail wear. One of the solutions proposed, to which Canadian researchers have devoted considerable development effort over the last several years, has been the radial axle steering-arm truck.

Anon. *TRNews* n 134 Jan-Feb 1988 p 12-13.

### Structural Design

**088690** NEW RECOMMENDATIONS FOR THE STRENGTH DESIGN OF URBAN TRANSIT RAIL VEHICLES IN THE FEDERAL REPUBLIC OF GERMANY. The recommendations for the strength design of urban transit rail vehicles, developed on the basis of the guidelines and units of the new BOStrab regulations, contain some new features. These include specification of precise input data, such as vehicle loads, traction stresses, impact forces, etc.; easily repeatable representation and calculation of the various loads, applying the principle of progressive subdivision into modular groups; listing all stress combinations relevant to tram cars, enabling stress analysis in terms of yield strength and fatigue limit to be carried out with a considerably higher accuracy than so far possible; and application of lower safety factors in the stress analysis relating to the yield strength due to more precise input data and calculation methods. The new recommendations will thus contribute to improving the lightweight design required for urban transit rail vehicles. (Edited author abstract) 13 refs.

## Vibrations

**088700 EIN ORTSBEWEGLICHES VERFAHREN ZUR MESSUNG DER ROLLINE.** [Mobile System for Measuring the Rolling Line]. The predetermination of dimensioning quantities for vehicle components is gaining ever-increasing importance. The reasons for this are both the state of the art in computing techniques and the increasingly higher demands on the quality of the vehicles which can no longer be satisfied by purely empirical methods. The representation of the vehicle as a mathematical model require an exact description of the external disturbance variables. In the case of rail vehicles these consist primarily of the track irregularities that excite forced vibrations. The mathematical model of these stochastic disturbances must reflect as comprehensively as possible the real conditions while being easy to manipulate. These requirements are currently met in the best

possible way by the rolling line for the lateral dynamics as defined by Wickens in 1968. Combining several disturbances, it represents the real conditions to a high degree. In addition, the rolling line is easy to treat, because it comprises only one disturbance function. Its successful application has so far not been practicable, because no suitable measuring methods have been available. Such methods are the subject matter of this paper. (Edited author abstract) In German. 11 refs.

Waechter, Klaus (Hochschule fuer Verkehrswesen 'Friedrich List' Dresden, Dresden, East Ger); Geyer, Karl-Eberhard. *Z Eisenbahnwes Verkehrstech Glasers Ann* v 111 n 5 May 1987 p 148-155.

**088701 MATHEMATISCHES FAHRBAHN/FAHRZEUG-MODELL ZUR ERMITTLUNG VON BEMESSUNGSDATEN BEI STOCHASTISCHER ERREGUNG.** [Mathematical Model of the Track-Vehicle System for Determining Design Data under Stochastic Excitation Conditions]. To ensure the general acceptance of lightweight construction for vehicle components, the stresses acting on them must be precisely known. To solve these problems, numerical computations are being used to an ever increasing extent in addition to the purely experimental approach. The principal advantage is that they allow for easier variation of the track and vehicle parameters. The prerequisite for applying the computational method is the development of an equivalent system representing the vehicle and its mathematical formulation. To represent the track conditions, the energy in the frequency range (power spectral density) has proved as useful analytical tool. The initial data derived from equations based on systems theory must be linked with the data describing the use of the vehicle (load added, traveling speed). Grouping the resulting triads of values according to maximum values yields the load collective as a replica of the real stresses. The shock and force impulses of interest for component dimensioning can likewise be analyzed in the frequency domain by applying the formula established by RICE. (Edited author abstract) In German 3 refs.

**088703 DIE BETRIEBSFESTIGKEIT SCHWINGEND BEANSPRUCHTER STRUKTUREN VON EISENBAHNFAHRZEUGEN.** [Serviceability of Cyclically Loaded Rail Vehicle Structures]. The need to achieve optimum lightweight design of rail vehicles in terms of adequate safety and maximum cost effectiveness calls for more consistent application of a design concept based on cyclic strength. With a given limited life and knowledge of the service loading combinations, the long service of life required in railway engineering can be achieved with adequate reliability by a specific excursion of the endurable stresses. In order to be able to apply the 3 concept of cyclic strength in the course of design work, a few prerequisites have to be fulfilled. The design loads and loading conditions for dimensioning and testing must describe the service loadings in such a way that their dynamic characteristics are fully covered. The deformations of the structure must be simulated in a dynamic manner by calculations and experiments to enable the number and magnitude of the local stress cycles which cause damage to the material to be determined. Stress-induced damage to highly stressed areas in the

structure can be quantified by means of Woehler lines describing the fatigue strength properties of the materials by defining states of combined stress and by applying the linear damage accumulation rule. (Edited author abstract) 56 refs.

**088705 DYNAMIC ANALYSIS OF HIGH SPEED RAILWAY TRUCKS FOR THE SHINKANSEN.** A numerical simulation approach of railway vehicle dynamics has been developed to improve the analytical accuracy and to analyze the problems which could not be properly assessed by the conventional linear analysis. It takes nonlinear characteristics of wheel/rail profiles, creep force saturation, and vehicle suspensions into consideration. In the present paper, first dynamic performances of high speed railway trucks for the Shinkansen were evaluated, and then the effects of truck parameters on the dynamic performance were investigated. It is clarified that data calculated by this approach is in better agreement with that by experiment than that by a linear analysis and that the lower lateral stiffness of the secondary suspension improves both ride quality and curving performance. **088706 SIMULATION UND EXPERIMENTELLE VERIFIKATION DES RAD/SCHIENE-ROLL-PRUEFSTANDS.** [Simulation and Experimental Verification of the Roller Test Facility]. A simulation model of the roll test stand located at Munich and loaded by a rail car tractor is discussed including its technical structure, the governing physical equations of motion and the simulation program structure. Both the set up time of the mathematical and numerical models and the computation time have been considerably reduced (by a factor of 20) using a symbolic computer language. The simulation results are compared with the experimental results gained from test facility measurements. (Author abstract) In German. 12 refs.

Hahn, H.; Siegl, G. *Ing Arch* v 57 n 5 1987 p 329-348.

**088707 ASSESSMENT OF WHEEL MAINTENANCE PRACTICES BY COMPUTER MODELING.** The paper describes the concept and development of a computer model which can be used as a management aid in evaluating wheel maintenance practices on economic and technical grounds. The model is capable of simulating the railroad system costs which are directly and indirectly sensitive to changes in the condition of the wheel fleet. By estimating the population distribution of wheels in terms of their condition, the model calculates the effects of varying system parameters on wheel machining and replacement requirements, fuel usage, rail wear and the costs associated with each of these factors. Implicit

assumptions contained in the model and possible applications of the model are also discussed. (Author abstract) 3 refs.

Davis, D.C. (BHP, Melbourne Research Lab, Aust). *Mech Eng Trans Inst Eng Aust* v ME 9 n 4 Nov 1984 p 295-300.

**088708 EXPERIMENTAL REPRODUCTION OF WHEEL FLAT.** Wheel skiddings are easily caused by a decrease in wheel-rail adhesion. They sometimes cause wheel-flat damage during braking. Wheel-flat reproduction was attempted for the purpose of developing a wheel material which has a higher resistance to the occurrence of flat damage. A two-roller testing machine in which a skidding device was incorporated suitably, was designed and manufactured for the reproduction test. The device can give rise to wheel skidding by two operations. One is the oil feed to the contact zone between the two rollers while the other is the brake application to the wheel-roller axle. The wheel skidding produces a wheel-flat whose occurrence is thought to be governed by both the lubrication condition and the flash temperature. The reproduced flat damage has nearly the same morphology as that of wheels in service with respect to the appearance of the deformed surface layer and the formation of thermal cracks in the layer. (Edited author abstract) 16 refs. In Japanese.

**088709 RAILWAY WHEELSETS - A CRITICAL REVIEW.** This paper gives a brief history of the evolution of wheelsets and then outlines the changes that have occurred in their design in the last 30 years, mainly due to the change to diesel and electric traction. Technical problems are discussed and the principal lines of research which have followed are described. As a result, tired wheels centers have largely been replaced by monoblock wheels with hardened trends, disc brakes have been introduced and the unmachined cast-steel wheel has become a serious competitor to the traditional forged and rolled wheel. Of great importance is the introduction of computer analysis of wheel stresses which has led to modifications to the wheelset to reduce stress and to set limiting values. (Edited author abstract) 40 refs.

Wise, S. (British Railways Board, Derby, Engl). *Proc Inst Mech Eng Part D* v 201 n 4 1987 p 257-271.

**088710 PARAMETRICALLY EXCITED BEHAVIOR OF A RAILWAY WHEELSET.** The dynamic response of rail vehicles is affected by parameters such as wheel-rail geometry, track gage, and axle load. Variations in these parameters, as a rail vehicle moves down the track, can cause instabilities that are related to parametrically excited behavior. This paper reports on the use of Floquet Theory to predict the stability and instability regions for a single wheelset subjected to harmonic variations in wheel-rail geometry, track gage and axle load. Time studies showing the response of a wheelset to various initial conditions are also included. The results show that harmonic variations in the wheel-rail geometry can influence the behavior of a wheelset significantly. (Edited author abstract) 35 refs.

**088712 IMPROVEMENT IN THE RELIABILITY**

**AND QUALITY OF RAILROAD WHEELS.** Service conditions of railroad wheel pairs have been made more demanding by the increase in rail transport in the USSR. To improve the reliability of these wheels, a series of fundamental improvements must be made in wheel material and design, the manufacturing practice, and wheel inspection. The author's plant takes steps at all stages of production to prevent the steel from becoming saturated with hydrogen, the presence of which leads to the formation of flakes in wheels. With this in mind, consistent inspection of the product to determine the hydrogen content is practiced. In steelmaking technology, the most promising method is single-slag steelmaking in electric furnaces, vacuum degassing, and deoxidation and modification with aluminum. The resulting steel contains a minimal amount of oxygen (0.0035-0.0040%) and hydrogen (no more than  $4 \text{ cm}^3/100 \text{ g}$ ), while the wheels made from it have a uniform macrostructure, a low content of nonmetallic inclusions, and rims and webs with high ductility and impact toughness. The cold shortness threshold is lowered by  $40-60^\circ\text{C}$ .

**088713 VIBRATION REDUCTION OF A RAILWAY WHEEL BY CANTILEVER-TYPE DYNAMIC DAMPERS (1ST REPORT, THEORETICAL ANALYSIS).** The lateral vibration of a wheel with cantilever-type dynamic dampers is analyzed theoretically by making use of the modal analysis and the receptance method. The damper is assumed to have two degrees of freedom: rotation and translation. Consequently, a moment and a lateral force acted between the damper and the wheel. The following results have been obtained by numerical calculations. When the damper is set such that the free end faces to the outside, the force and the moment act to reduce the vibration. When the mass of the damper is  $1/100$  of that of the wheel and the length of the cantilever is  $1/5$  of the wheel's radius, the vibration can be reduced significantly. (Author abstract) In Japanese. 7 refs.

**088714 APPROXIMATE MODEL WITH AN INFINITE NUMBER OF VEHICLES FOR ANALYSIS OF COUPLED VIBRATIONS BETWEEN RAILWAY VEHICLE WHEELS AND RAIL IN THE VERTICAL DIRECTION.** This paper presents an approximate model with an infinite number of vehicles in which an infinite number of wheels are arranged with a certain periodicity on the top of an infinitely long and straight rail installed on a distributed spring in the vertical direction. This model is very effective for the analysis of the coupled vibrations between railway vehicle wheels and a rail for the case of a great number of wheels. Using the analytical model, the contribution of the rail to the coupled vibrations was examined for each section partitioned by wheels over the length per Shinkansen vehicle. As a result, it became clear that the vibration of the rail between the wheels of a truck is dominant in a frequency region lower than  $2 \text{ kHz}$ , and that of rail near a coupler between vehicles is also important in a frequency region higher than  $1.5 \text{ kHz}$ . (Author abstract) 12 refs. In Japanese.

**088715 ALLOWABLE CRACK SIZES FOR RAILWAY WHEELS AND RAILS.** Determined are the critical crack sizes and crack growth characteristics for train car wheels and rails. Service and test limit size of cracks need to be distinguished in view of the difference between subcritical and the onset of rapid crack propagation. Probabilistic calculations have many advantages, but they cannot accurately predict either the real critical minimum crack size  $(a_c)_{\min}$  or the real maximum crack growth increment  $\Delta a_{\max}$ . As representative values of the minimum critical crack size  $a_c^*$  and the maximum crack growth increment  $\Delta a^*$  are chosen for the calculations,

therefore, the values which have a survival and crack growth probability, respectively, of 90%. Safety factors  $S(a)$  and  $S(a^*)$  are needed to account for the scatter of  $a_c$  and  $\Delta a$  for probabilities of more than 90%. Probabilistic fracture mechanics is applied to analyze the behavior of transverse cracks in the rim of tread-braked monobloc wheels, transverse head cracks in rails and aluminothermic rail welds. (Edited author abstract) 17 refs.

**088716 LIFE PREDICTION OF THERMALLY CRACKED RAILWAY WHEELS: GROWTH ESTIMATION OF CRACKS WITH ARBITRARY SHAPE.** A computer program for railway wheel life prediction has been developed incorporating an elastoplastic calculation of both the residual stress field induced by shoe-braking and the superposed alternat rolling contact stresses. The possibilities of unstable propagation of surface cracks, crack arrest, fatigue propagation through a complex stress field and crack detention on reaching the threshold value have been accounted for. An approximate method for crack growth prediction is used providing bounds for instantaneous crack front position and estimations of crack shape within short computing times. Some examples of application for an UIC R7 wheel are presented. (Author abstract) 31 refs.

Meizoso, A. Martin (Centro de Estudios e Investigaciones Tecnicas de Guipuzcoa, San Sebastian, Spain); Sevillano, J. Gil. *Theor Appl Fract Mech* v 9 n 2 Apr 1988 p 123-139.

**088717 EXPERIMENTAL REPRODUCTION OF WHEEL-FLAT.** Wheel-flat reproduction was attempted for the purpose of developing a wheel material which has a higher resistance to the occurrence of flat damages. A two-roller testing machine, in which a skidding device was incorporated suitably, was designed and manufactured for the reproducing test. The device can give rise to wheel-skidding by two operations. One is the oil feed to the contact zone between the two rollers and the other is the brake application to the wheel-roller axle. The reproduced flat damage has nearly the same morphology as that of the wheels in service with respect to the appearance of the deformed surface layer and the formation of heat checks in the layer. The occurrence of a wheel-flat is thought to be governed by both the lubrication conditions and flash temperature. (Author abstract). 5 refs.

**088718 ZENTRALSTELLWERK FULDA FUER DIE NEUBAUSTRECKE HANNOVER - WUERZBURG.** [Fulda Central Signal Box for the New Hannover-Wuerzburg Line: New Building, Conversion and Expansion Work]. The timely completion of the Fulda central signal box in September 1985, using SpDr S600 technology from Siemens AG in Braunschweig, laid the foundation for the on-schedule start of track layout conversion work at Fulda station for the new Hannover-Wuerzburg line. The conversion work will span the period 1983-1990 and include a total of 89 construction phases and 28 signal work phases. The SpDr S600 signalling equipment has proved to be very advantageous in particular on account of the rapid succession of building phases. With the start of operations on the Fulda-Wuerzburg section of the line, work is nearing completion on transforming the central signal box into a remote control

centre, using the F70 remote control system supplied by Standard Elektrik Lorenz (SEL) AG of Stuttgart with a ZN P800 magazine train describer from Philips in Kiel, and a centre for continuous wayside control using SEL technology. (Author abstract) In German.

**088719 MICROPROCESSOR-BASED RAILWAY INTERLOCKING CONTROL WITH LOW ACCIDENT PROBABILITY.** A laboratory model incorporating a microprocessor-based system to control signals and points and to monitor track circuits is described. Approach locking and backlocking controlled through a programmable timer are included. The model consists of a control panel with entrance-exit type control, namely, a switch and a pushbutton for each route. Light-emitting diodes take the place of signal lamps. Points are simulated by means of three position-neutral polar relays. A method of reducing the probability of accidents associated with this type of control is presented. It consists of duplicating the input channels and utilizing redundant input data. 2 refs.

**Interlocking** See Also RAILROADS—Automatic Train Control; SUBWAYS—London, England.

**088720 BAHN 2000 PROMPTS SBB RESIGNALING.** The introduction of an improved fixed-interval service throughout Switzerland (called Bahn 2000) will mean 2 min headways on many main lines and maximum speeds of 200 km/h. To achieve these objectives new signalling and automatic train control are needed. To upgrade existing signalling would magnify the present deficiencies and lead to more complicated illogical colour codes. Swiss Federal Railways (SBB) therefore decided to develop a different system fulfilling the requirements of Bahn 2000 which also overcame existing deficiencies. The chosen strategy relies on speed-control signalling indicating to the driver the permitted speed. Each signal indicates permission to proceed and the permitted speed; all signals are 'combined', in that each is an 'advance' or distant for the next.

Anon (Swiss Federal Railways). *Railw Gaz Int* v 143 n 10 Oct 1987 p 669-672.

**088721 SOLID-STATE INTERLOCKING IN RAILWAY SIGNALLING, SMILE AND  $\mu$ -SMILE.** Two types of solid-state interlocking systems are presented. SMILE, applicable to a large station, is composed of multi-microprocessors for realizing various automated functions flexibly, while  $\mu$ -SMILE with a simple structure, is applied to a small station. The fail-safe technology and system architecture of these systems are shown. A network of electronic signaling terminals for reducing the total length of signaling cables in a station is also given. The characteristics of safety and reliability are predictably better than those of a relay interlocking system by 100 times. 12 sets of SMILE and 3 sets of  $\mu$ -SMILE are operating in Japan Railways. (Author abstract) 3 refs.

**088722 EVOLUTION DES EQUIPEMENTS DE SECURITE SUR LES LIGNES A UNE SEULE VOIE.** [Development of Safety Equipment on Single-track lines]. Substantial changes are being made to the safety equipment on SNCF single-track lines. Once they are completed there should no longer be any lines carrying passenger traffic on which the only safety system is the telephone block. Different systems therefore are or will be in service. An important program for installing interlocked block equipment is being implemented. Lines carrying only light traffic which do not require heavy-duty equipment are being fitted with the CAPI system which,

with its microcomputers, gives a higher level of safety to messages exchanged by the telephone block. Fortified by the experience acquired in Cerdagne with a line operated by radio, research is being carried out to develop an economical system which, by combining computer techniques, data transmission by radio and train passage detectors, should enable a very satisfactory level of safety to be obtained on lines carrying light traffic, while at the same time being inexpensive to operate. (Edited author abstract) In French.

Savelli, Gilbert (SNCF); Van Deth, Francois. *Rev Gen Chemins Fer* v 107 n 4 Apr 1988 p 41-50.

**088723 BLOCK AUTOMATIQUE A PERMISSIVE RESTREINTE DE VOIE BANALISEE 'S'.** [Restricted Permissive Automatic Block for 'S' Two-Way Working on Single Track]. To provide single-track lines with an interlocking block, the SNCF is developing at the same time as the conventional single-track manual block a restricted permissive automatic block known as the BAPR for 'S' two-way working track. On lines provided with this system, trains are spaced automatically because their location is detected either by track circuits or axle counters. On the other hand in contrast to the practice in the centralized control system the points and their protective signals are still operated by hand. (Edited author abstract) In French.

**088724 CFF RAIL LINK TO GENEVA AIRPORT.** In Switzerland, CFF have been operating a rail link from Zurich Central to Kloten Airport since June 1980, thus affording air passengers a convenient, direct and quick getaway from or access to the airport by train. In the case of Geneva, the concept involved extending the Lausanne-Geneva double-track line as far as the Airport to cater for direct and IC train services. By comparison with a straightforward shuttle service between the Airport and Geneva, this solution enables users to access most of the country's main cities and regions or inversely the Airport itself without train transfer at Cornavin. This was the background against which the definitive specification for the rail link project was developed. The article describes the project, operations, traffic projections, project cost/profitability.

**Accident Prevention** See RAILROAD ACCIDENTS—Derailment.

**Accidents** See Also HIGHWAY TRAFFIC CONTROL.

**088725 ACCIDENT CAUSATION ANALYSIS AT RAILROAD CROSSINGS PROTECTED BY GATES.** This study identifies probable causes of and factors responsible for accidents occurring at railroad crossings protected by gates. Two important goals were to (a) compare the results obtained for the two types of warning systems activating the gates: fixed distance and constant warning time systems, and (b) test the hypothesis that extended, or widely variable, warning times create a lack of credibility in warning signals. These objectives were achieved by statistically analyzing accident data obtained from the National Rail-Highway Crossing Inventory and

the Railroad Accident/Incident Report files for the period 1975 through 1984. An accident classification by circumstance (movement and position of the car in relation to the tracks and the trains) highlighted some causes and factors responsible for the different types of accidents. (Edited author abstract) 10 refs.

**088727 HERMES-DATA TRANSMISSION SYSTEM OF THE INTERNATIONAL UNION OF RAILWAYS.** The HERMES system is a computer system linking up the UIC Railway computer centres by means of a data transmission network. The article follows the development of the project from its inception in 1971 to its phase of operational and geographical expansion in 1987. The writer describes the different components of the system, link-up possibilities and applications. He also shows how a large-scale project with international repercussions and effects on the development of the member networks was integrated into the UIC's general organization. (Edited author abstract).

Marty, G. (UIC General Secretariat). *Rail Int* v 19 n 6 Jun 1988 p 3-11.

**088728 DOCIMEL, AN INTERNATIONAL PROJECT INVOLVING EUROPEAN MEMBER RAILWAYS OF UIC AND CIT.** DOCIMEL (Document Cim Electronique) is designed to develop computerised interfaces between the Railways, their customers, customs and other transport modes as much as possible, so as to limit data capture operations to the strict minimum, and in the longer term to eliminate the physical dispatch of documents, and thereby improve transport quality. Each consignment will be recorded on a computer file, itself triggered by the supply of data from shippers, such data being then supplemented during the actual transport process. Initially, the system could be applied in traffic between those Railways linked into the HERMES international railway data transmission network, in other words DB, SNCB, DSB, SNCF, FS, BR, and CFF at the present time. (Edited author abstract).

**Computer Applications** See RAILROADS—Automatic Train Control.

**Computer Simulation**

**088729 COMPUTER SIMULATION: A TOOL FOR CONTROLLING THE TRANSPORTATION OPERATING PLAN.** Management's tasks in guiding a corporation are to plan, organize, and control. In a transporta-

tion company, the transportation operating plan is the tool by which all activities are organized. Control of the operating plan takes place at two levels: 1. First Level - Top management is responsible for long-term control and effectiveness of the transportation plan. 2. Second Level - Division management is responsible for short-term, daily implementation of the transportation plan. Computer simulation is a cost effective management tool which can be used at either the first or second level to control the operating plan. This paper describes specific simulation models and how they are applied to solve railroad operating problems. Corporate benefits are discussed, and factors for insuring successful use of the models are highlighted. (Author abstract)

Wolf, G.P. (Norfolk Southern Corp, Atlanta, GA, USA). *Rail Int* v 18 n 12 Dec 1987 p 26-33.

## Control

**088730 CONTROL OF SIGNALS AND POINT MACHINES IN INTERLOCKING SYSTEM ERILOCK 850.** Computer-controlled interlocking systems for railway yards include object controllers, which supervise and control objects in the railway yard, such as signals and point machines. In the computerized all-electronic interlocking system ERILOCK 850, the object controllers are microprocessor-controlled and, unlike earlier versions, there are no safety relays. The requirement for fail-safe operation has greatly influenced the design of the object controllers. The author describes the principles and structure of the object controllers, particularly the design methods used to ensure fail-safe operation. (Author abstract) 1 ref.

Celinski, Kristoffer. *Ericsson Rev (Engl Ed)* v 64 n 4 1987 p 182-188.

## Costs

**088731 ROLE OF COMPUTERS IN THE COMMERCIAL POLICY OF SA TRANSPORT SERVICES.** A new sophisticated integrated accounting system (INTAC), catering to more than 80,000 clients, was implemented on 1 October 1987. It combined the latest available technology with streamlined accounting procedures - linking a countrywide on-line network to a dedicated mainframe computer via various systems: 491 on-line terminals at 120 sites, 10 dedicated data capturing mini systems with 215 terminals and three document reading systems. This latter system, using laser technology, is capable of handling 60,000 to 100,000 freight and accounting documents daily and will account for R5 billion per annum. An additional feature is that 95 percent of tariffing takes place automatically, which enhances accurate accounting.

Coetzee, G.J.S. (SA Transport Services). *Rail Int* v 19 n 6 Jun 1988 P12.

## Developing Countries

**088732 I TRASPORTI FERROVIARI NEI PAESI IN VIA DI SVILUPPO. SITUAZIONE E PROSPETTIVE.** [Railroad Transport in the Developing Countries, Situation and Prospects]. Physical and functional characteristics of the railway transport networks in the developing countries (P.V.S.) are presented. A definition of normalized parameters which permit a summary assessment of the 'state of the art' of railway transport in these countries is given. The areas involved in the railway system are brought out, taking account of the connection existing between the various traffic basins. Useful indications for the drawing up of development plans and projects for the sector, to be carried out in successive time phases, are outlined. (Edited author abstract) 6 refs. In Italian.

**Economics** See Also RAPID TRANSIT—Environmental Impact; RAPID TRANSIT—Personnel.

**088733 EUROPAEISCHE SCHNELLBAHN-NETZE VERKEHRS- UND IMAGEPOTENTIAL FÜR DIE BAHNEN.** [European High-Speed Railway Networks and Their Impact on the Transport and Image Potential of the Railways]. Do railways stand at the threshold of a 'brave new world', offering profitable, rapid, clean, safe and fuel-efficient services, with the ability to carry more passengers without making additional claims on precious land? Both experience from the considerable impacts on the market caused by high-speed trains and model computations on European high-speed rail networks demonstrate that the high-speed concept can open new perspectives to railways' long-distance passenger transport. High-speed rail networks generate considerable traffic and image potentials, but their realization requires actions which meet the market requirements. (Edited author abstract). In German.

Eberlein, Dieter (DFVLR, Cologne, West Ger); Neusser, Hans-Gustav. *Z Eisenbahnes Verkehrstechn Glaser Ann* v 112 n 5 May 1988 8p.

**Efficiency** See RAILROADS—Modernization.

## Energy Conservation

**088734 DEVELOPMENT OF A FUEL CONSERVATION PROGRAM.** Illinois Central Gulf (ICG) formed a group to address energy issues, particularly at reducing diesel fuel costs. A one-meter system, the fuel auditor, was developed which provided direct readings electronically to the research car. The group's findings included: fuel savers; dynamic brake; aerodynamics and engineer performance.

Bolla, Wayne F. (Planning Section Inc). *Mod Railroads* v 42 n 10 Oct 1987 p 37-38, 40.

**088735 NUMERICAL METHOD FOR MINIMUM ENERGY PROBLEM OF TRAIN CONTROL.** A new algorithm for the numerical solution of the energy optimal control of a train is suggested. The tractive characteristics of the engine, the piecewise constant upper limit of the velocity and the variable railway profile are given, and the exact time interval is prescribed. The method is based on Pontryagin's maximum principle for the systems with bounded state and control variables and on the simulation results. (Author abstract) 8 refs.

Fidler, J.; Tuzar, A. *Probl Control Inf Theory* v 16 n 3 1987 p 223-231.

**088736 ENERGY CONSUMPTION: 'INTO THE 21ST CENTURY WITH THE TRAIN - SAVE ENERGY AND SAVE THE ENVIRONMENT'.** According to the most recent estimates, the earth's mineral oil reserves will only last for another 35 years. Bearing in mind this forecast, measures are going to have to be introduced to cut back on mineral oil consumption in the German transport sector, which at present accounts for half the use of mineral oil in the country. Today, rail transport, particularly electric traction, already offers a means of saving energy. Energy sources can be saved and the worrisome situation concerning noxious emissions into the atmosphere, which are expected to reach dangerous levels at the turn of the century, can be considerably improved. (Edited author abstract)

Harprecht, W. *Rail Int* v 18 n 10 Oct 1987, Int Environ Symp: Eur Railw - An Asset for the Environ, Mannheim, West Ger, Oct 22 1987 p 58-62.

## Environmental Impact

**088737 ECOLOGICAL FACTOR IN THE EVALUATION OF SOCIAL COSTS FOR RAIL, ROAD AND WATERWAY TRANSPORT.** The results of different ongoing studies and investigations would suggest, by way of a universally-recognized conclusion, that environmen-

tal pollution at several levels (air, water, soil, natural resources, noise, etc.), is showing disturbing signs of worsening, given the extremely harmful effects of these different compounded factors. Bearing in mind that the population explosion is set to continue, and that the technico-scientific revolution is irreversible, it is vital relentlessly to safeguard the quality of our environment, since this in the final analysis is what determines the equilibrium of the system. What should and can be done rightaway on a more extensive basis is to acquire more detailed knowledge about our surrounding environment at all levels through system methods. In this sense, environmental system research will provide indications as to the relevance of socio-economic development measures, their real economic efficiency and, more importantly, their long-term effects on the environment. The negative social and ecological implications of transport activities on the surrounding environment are determined, and various influencing factors have been taken into consideration in the analysis and calculations.

**088740 BN'S EXTRAORDINARY EXPEDITERS.** The Burlington Northern (BN) Railroad's Expediter trains are a solid success. In the two and a half years since the network began running, Expediter has virtually become the standard nomenclature for short, fast, frequent intermodal trains operated by two-member crews and offering truck-competitive service in the short-to-medium distance range. BN is achieving a high degree of flexibility by networking most Expediters through its route structure like passenger trains. Expediters simply stop and drop a block, then pull into the clear so a new

block can be coupled on to the hind end. The result is not only less terminal delay, but a better ride for the trailers and their contents.

Plous, F.K. Jr. (Railway Age, New York, NY, USA). *Railway Age* v 188 n 11 Nov 1987 5p between p 30 and 48.

**088741 BOOSTING CAPACITY IN COAL CORRIDORS.** With 70% of China's motive power fleet still steam, it is easy to appreciate how much the network must be modernised to raise capacity. Electric traction handles only 19.4 million tonnes, so expanding the fleet of electric locos is a major priority. Similar emphasis is also being accorded to other methods of achieving extra capacity. Dedicated unit trains will operate on heavy haul routes such as the 650 km Daqing line from Datong to Qinhuaogao. Construction of this route began in 1984 and will be completed on schedule with opening throughout in 1991. It will carry coal from the mines in Shanxi province both for export and domestic consumption in cities on the eastern littoral. Principal motive power on the Daqing line will be the twin-unit Shaoshan 4 electric loco rated at 6 400 kW. A single loco of this type will be able to handle a train of 6000 tonnes, while double heading will permit a trailing load of 10,000 tonnes.

**088743 EINE INITIATIVE DER FRANZOESISCHEN STAATSBAHNEN: EILGUTTRANSPORT MIT HOHEN GESCHWINDIGKEITEN (160 KM/H).** [Fast Freight Surface at High Speeds (160 Km/hr): An Initiative of the French National Railways]. To win back shares in the freight traffic market lost to road-based competitors, the project ETNA (development of technologies for improving the product) will be launched by SNCF as an experiment starting in 1988. Using a computer-based system, freight trains will be made up as unit trains for three classes of service, i.e. very urgent, urgent and less urgent freight, and thus be fully utilized. The trains will run at speeds between 100 and 160 km/h. The number of slower trains will be reduced. Owing to the high operating speeds, the cars will have to be modified at the bogies or replaced with new designs. (Edited author abstract) In German.

**088744 UNE NOUVELLE ETAPE DE L'INFORMATISATION DU CALCUL DES COUTS MARCHANDISES: LE MODELE 'TRAINS COMPLETS'.** [Further Stage in the Computerization of Freight Cost Calculations: the 'Complete Train-Load' Model]. A computer-based system for calculating diminishing marginal costs (GEC costs), applied to forwardings in separate cars made up into groups, has been in operation since 1984. This system has been extended to complete train-load traffic by creating a separate model which has been used by the marketing team since the beginning of 1987. In the same way as the system processing groups of cars, it is a facility available in real time from any point on the system by means of a linked terminal or a Minitel. It provides details of the optimum routing of a train and the cost price (actual marginal cost) which must be known before embarking on commercial negotiations. This article ex-

plains the system very generally, placing emphasis on the basic options selected, after briefly describing the actual calculation process. (Edited author abstract) In French.

**088745 LE SYSTEME INFOSUIVEUR DU SERNAM: UNE ETAPE IMPORTANTE.** [SERNAM Info-monitoring System: an Important Stage]. The parcel carrier today has to face many problems which give the profession a new technological dimension and make it increasingly complex. To achieve the performance required by the market, mastery of the flow of information becomes just as vital as that of the flow of freight. SERNAM intends to progress rapidly in this sphere and the SERNAM-EXPRESS info-monitoring system is the first expression of this intention. It enables the location of each consignment in the transport chain to be determined in almost real time by means of electronic gates (passed obligatorily or contingently) and thus to provide information to the transport operators and the customers on the progress of their consignments. This system is a powerful tool helping to provide a higher quality service and better transparency. (Edited author abstract) In French.

De Saint-Exupery, A. *Rev Gen Chemins Fer* v 107 n 2 Feb 1988 p 55-61.

## Fuel Economy

**088746 RAILROADS STRETCH FUEL DOLLARS... WITH ADDITIVES.** An on-going test in revenue service on a southwestern railroad will try to determine optimum levels for wax crystal modifiers, or flow improvers, as well as for kerosene. The primary fuel filter of the locomotive operating on untested fuel failed after nine or 10 weeks of service, while those treated continued to operate through the entire test. Another apparent benefit was that more complete combustion with less soot and carbon and carbon deposits. Fuel stabilizers can improve the performance of low-cost fuels. In some cases, the fuel treatment can be expensive.

Anon. *Mod Railroads* v 42 n 12 Dec 1987 p 47.

**088747 ENERGY AND TRANSPORT: THE INDIAN EXPERIENCE.** Changes in commercial energy consumption are reviewed. Major determinants of increase in energy demand and change in the demand mix are identified as: (i) expansion of economic activity; (ii) intermodal shifts, and (iii) developments in the energy efficiency of each mode. Rail and road still continue to be the major modes of transport in the country, although air traffic has witnessed the fastest growth. The distinct shift from rail to road during the past two decades has been discussed, and factors underlying the accelerated growth of diesel demand for both rail and road transport are identified. (Edited author abstract)

## Italy

**088748 L'OFFERTA VIAGGIATORI E MERCI PER L'ORARIO 1987-88.** [Passenger and Freight Services Offered by the 1987/88 Timetable]. The authors illustrate the timetable brought into force on 31.5.1987, bringing out the innovations regarding both passenger and freight trains. With the new timetable there will be appreciable improvements for all services, both as an increase in commercial speeds and in the services offered: the more qualifying innovations are the regular spacing of passenger trains on the Rome-Milan route and a wider supply of freight services during the summer period. An extensive documentation is given of the various parameters tied to the infrastructures affecting the drawing up of the timetable, of the criteria adopted and of the changes introduced on the lines of the network also in relation to traffic flows, in particular for the freight service. (Author abstract) In Italian.

Italy); Romano, Luigi. *Ing Ferrov* v 42 n 8 Aug 1987 p 413-434.

## Magnetic Levitation

**088749 CONTROL METHOD FOR A TWIST RESPONSE TYPE OF ELECTROMAGNETICALLY LEVITATED TRUCK AND ITS EXPERIMENTS USING DIGITAL CONTROL THEORY.** The magnetically levitated railway using normal conducting magnetics has a disadvantage (in comparison with railway using superconducting magnets): it is difficult to widen the air-gap length. The amount of energy required to maintain levitation can be reduced by decreasing the air-gap length. In practice, however, many technical problems have to be solved to reduce the air-gap length, including the response characteristics to the rail discontinuity at rail joints and height difference due to cant. This paper discusses the features and control methods of twist response type electromagnetically levitated truck and presents its digital control performances. 8 refs.

**088750 NOW...FOR SOMETHING RATHER DIFFERENT.** The author, 1987 Railway Division chairman, reviews the changes that have taken place on the railways since his first early association with British Railways. The author describes a program of continual development and change, from the introduction of the first diesel locomotive to electrification, and the important part new technology has played in the changes. (Edited author abstract)

Casey, M.V. (British Railways Board). *Proc Inst Mech Eng Part D* v 201 n 4 1987 p 245-256.

**088751 EFFICIENCY AND TECHNICAL DEVELOPMENT - CZECHOSLOVAKIAN RAILWAYS COME UP WITH LONG TERM SOLUTIONS.** The article traces the efficiency/technical development of Czech railways from 1950, since the strong upsurge in economic development, to the present. The increase in development is closely linked with the development facilities for its personnel whose productivity is continually increasing. Other important factors leading to railway efficiency are also discussed.

Chovan, R. *Rail Int* v 19 n 4 Apr 1988 p 3-7.

**088752 MANAGEMENT AND MODERNIZATION OF THE ITALIAN STATE RAILWAYS.** The Italian State Railways (FS) combines both modern techniques and older installations. It is confronted with certain shortcomings, notably in capacity and productivity. A number of recent measures should rectify this situation: the adoption of enterprise management, greater financial means for the realization of investments, the improvement of services, introduction of high speed, etc. This ambitious program, to which the company management is deeply committed, will give the railway the place it deserves within the Italian and European transport systems. The programme is discussed in terms of passenger service, freight traffic, and investments.

## Noise, Acoustic

**088753 PREDICTION PROCEDURE FOR RAIL TRANSPORTATION GROUND-BORNE NOISE AND VIBRATION.** A procedure has been developed for predicting groundborne noise and vibration caused by rail transportation systems. The primary focus is the estimation of low-level, low-frequency groundborne noise and

vibration between 6.3 and 200 Hz in residential and commercial buildings near at-grade and subway track. Two particular features of the method are the use of impact-testing procedures to characterize vibration propagation in soils and the use of 1/3 octave band force densities to represent specific vehicle and track systems. Directions for future research are discussed, including numerical modeling of subway structures and vibration propagation in soils, truck and track dynamics, and propagation of vibration through buildings. (Author abstract). 14 refs.

Optimization See ELECTRIC RAILROADS—Paris, France; ELECTRIC RAILROADS—Zurich, Switzerland; RAILROADS—France.

#### Personnel

**088754 PROBLEMS OF OCCUPATIONAL HYGIENE AT RAILWAY TRANSPORT FACILITIES.** Complex investigation of vital problems of occupational hygiene at railway transport and construction facilities along with the underground railway plays an important role in consistent improvement of working conditions and health protection of numerous workers engaged at the enterprises of the Ministry of Transportation and Ministry of Transportation Construction of the USSR. The study provides for the improvement of preventive sanitary surveillance during transportation construction and reconstruction, introduction of new processes and technology, development and implementation of the state and industry standards, normative, instructive and methodological documents ensuring labor protection and safety, morbidity reduction and accident prevention among workers. (Author abstract) In Russian. 4 refs.

Prokhorov, A.A. *Gig Tr Prof Zabol* n 4 Apr 1988 p 6-9.

#### Planning

**088755 PITTSBURGH'S RAIL TRANSIT RENAISSANCE.** The success of the first phase of the rail rebuilding program is leading Port Authority Transit (PAT) and the Allegheny County Board of Commissioners to study the development of a new rail line between downtown and the North Side. Bus ridership in this corridor exceeds 50,000 riders daily. Study and implementation of transit alternatives are necessary to accommodate the growth anticipated in this already heavily transit-patronized region. The interurban lines are also proposed to be rebuilt to light-rail standards. Transit in Pittsburgh is changing. The conversion of an on-street trolley network into a modern, grade-separated subway/light rail operation and the construction of bus-only roadways are representative of a progressive transit system preparing for the demands of the next century.

Beim, Joseph (Storch Associates, Westbury, NY, USA). *ITE J* v 58 n 7 Jul 1988 p 43-46.

**088756 DEFINITION OF ACCESSIBILITY FOR RAILWAY STATIONS AND ITS IMPACT ON RAILWAY PASSENGER DEMAND.** The article discusses the notion of accessibility and presents the special factors and the issues involved in its definition for (intercity) railway stations. It chooses the form that statistically explains better the changes in the number of passengers using a station. The methodology followed in order to do this can be used as a guideline for determining the type of index that would best explain the data in other similar situations. Having selected an index, a simple regression model has been made that connects this accessibility index to the number of passengers using the station. The type of this relation, its statistical characteristics, and its sensitivity are discussed and some useful overall conclusion reached. The data used and a first application of the results refer to the railway network of Greece. (Edited

author abstract). 15 Refs.

**088757 NEW LINE CONSTRUCTION IN THE FEDERAL GERMAN RAILWAYS.** The two newly constructed lines, Hanover-Wurzburg and Mannheim-Stuttgart, are the core of the network modernisation concept for the Federal Germany Railways. The disturbed topography in the central highlands, habitation density and population structure as well as the relatively elongated route of the line have resulted in a great number of tunnels. The high proportion of tunnels and above all the unaccustomed lengths in Federal Railways terms, travelled at a maximum speed of 250 km/h, call for overall verification of accident provision strategy. Access roads are to be provided to the tunnel portals for fire brigade rescue vehicles and helicopter landing places are to be indicated. 18 refs. In English and German.

#### Quality Control

**088758 PASSENGER TRAINS AND SERVICE, QUALITY FOLLOW-UP.** This article gives an account of how Danish Railroad's traffic production has taken up the challenge of an actual quality control from around 1982 and later. This has not been on the basis of strict theoretical viewpoints or with the help of advanced statistical methods, but through a pragmatic attitude towards management and system development. This article is concerned only with that part of quality control which is related to the actual train journey.

Kristensen, O.D. (Danish State Railways, Den). *Rail Int* v 18 n 8-9 Aug-Sep 1987 p 9-16.

#### Research

**088759 AUSTRALIAN RAILWAY RESEARCH AND DEVELOPMENT ORGANISATION AND OTHER TRANSPORT BODIES.** The Australian Railway Research and Development Organization (ARRDO) was formed in 1977. Its work was directed toward the financial and managerial problems of the five government rail systems in Australia. The systems were facing huge deficits. Two crises occurred. In 1983, ARRDO's output became almost nil. With a new management structure, its output resumed, but by 1985 it was falling behind with a new research program. Further reorganization occurred to fit a reduced program to the staff available and output continued, but in May 1986 came the decision to dissolve the organization. In this paper, the research programs and output are discussed and compared with those of the Australian Road Research Board and the Bureau of Transport Economics. ARRDO was more introspective than the other two, and its failure to communicate effectively its research results with the rail systems may have led to its demise. (Edited author abstract) 20 refs.

#### Route Analysis

**088760 RAIL FREIGHT TRANSPORTATION: A REVIEW OF RECENT OPTIMIZATION MODELS FOR TRAIN ROUTING AND EMPTY CAR DISTRIBUTION.** This paper describes two types of rail transportation problems in detail. These are train routing and makeup, and empty car distribution problems. Some of the recent optimization models which address these problems are reviewed and the areas for potential improvements in rail transportation literature are identified. The type of interactions which exist between routing, makeup, and empty car distribution decisions are highlighted and potential areas for future research are identified. (Author abstract) 65 refs.

Haghani, Ali E. (Northwestern Univ, Pittsburgh, PA, USA). *J Adv Transp* v 21 n 2 Summer 1987 p 147-172.

**088761 ROLE OF TRAMWAYS IN THE FUTURE BUDAPEST TRANSPORT SYSTEM.** This paper reviews the exciting plans for the construction of a Metro Network and the reduction in the roll of tramways, against the background of the anticipated growth in car ownership. The paper argues that the best policy may be to invest the capital funds available, after Metro line 3 reaches the Ujpest District centre, in the gradual upgrading of the tramway network to an 'Express' standard, with a speed of 25 km/h, stops of about 0.5 km tramlines separate from other road traffic, and the pre-emption of traffic signals to remove the effects of general traffic congestion. Such a policy could be completed by 2000 giving a fast rail network including Metro of over 150 km, providing a competitive alternative to the private car. (Edited author abstract) 6 refs.

#### Scheduling See Also RAILROADS—Japan.

**088762 PREDICTING DISPATCHING DELAYS ON A LOW SPEED, SINGLE TRACK RAILROAD.** This paper presents queueing models for predicting dispatching delays on single track, low speed rail lines with widely spaced passing locations. Because of scheduling unpredictabilities, we assume Poisson arrivals of trains. Because of the slow transit speeds, we assume that trains traveling in the same direction can do so on close headways. We also assume siding capacity of passing locations is not limiting. Under these assumptions, we calculate expected delays on individual segments of single track and for segments of single track with an alternate route. (Author abstract) 7 refs.

#### Toronto, Canada

**088764 SIMULATION MODEL OF SHARED RIGHT-OF-WAY STREETCAR OPERATIONS.** Described in this paper is the Queen Streetcar model, a large FORTRAN program currently under development that simulates light-rail vehicle operations on the Queen Route in Toronto. This service operates in mixed traffic and on a reserved right-of-way over a 21-mi route. The model is designed to analyze the impact of a range of operating policies on the regularity of streetcar service. Specifically, the model is intended to allow examination of operating procedures and then permit comparison with alternate means of regulating service, such as alternative short-turn strategies; use of a centralized automatic vehicle monitoring system; and introduction of traffic signal priorities for transit vehicles, reserved rights-of-way, or larger capacity vehicles, or both. The model proceeds by computing the amount of time that each streetcar will spend in a logical set of 'states' within each link within the network, where streetcar states include moving in a link, loading and unloading passengers at a stop, and so forth. (Edited author abstract). 2 refs.

## Traffic Control

**088765 PLANNING, ALLOCATION AND CONTROL OF ROLLING STOCK DESIGNING AND EXPLOITING SYSTEMS TO MEET BUSINESS OBJECTIVES.** The trend of development on British Rail in regard to systems of automatic data capture for the control and movement of rolling stock is briefly described. The implications of information technology developments on the traditional railway multi tiered management structures has caused and will continue to cause a change in the level at which strategic and tactical decisions can be made. The direct involvement of production workers with computer systems continues as hardware technology and software 'user friendliness' continues to develop. The author does not believe that the peak of Information Technology growth has yet been reached and the integration of large separate systems will become the next major thrust of development as organizational development continues. (Edited author abstract)

Scobey, B.J. (British Rail). *Rail Int* v 19 n 1-2 Jan-Feb 1988 p 52-60.

**088766 RAILWAY OPERATIONS CONTROL.** Plans for the future development of the national economy provide for a further increase in traffic on Soviet Railways. This calls for measures to improve railway operations substantially for advanced-technology applications and for optimized utilization of existing technical means. The article deals with measures being taken by the railways to improve the system of management, to implement modern means of mechanization and automation, to increase the length and weight of trains, to compile optimum train schedules, etc. (Author abstract)

## USSR

**088767 USSR RAILWAY TRANSPORT - 150 YEARS.** The Soviet railroads were, and will be the decisive type of transport for the USSR conditions. Such an importance of railway lines is explained by their high carrying capacity and maximum suitability for realization of transportations of bulk commodities, saving of power and labor costs per unit of shipment, low prime cost, practical independence upon climatic conditions, ecological purity. In the USSR the railway transport incorporates apart from 32 railroads, which have administrative self-supporting, also 11 rapid transit systems in the largest cities of the country, more than 100 factories manufacturing spare parts and performing repair of rolling stock, signalling and telecommunications, electrical equipment and switches, about 150 enterprises of industrial transport.

## Classification Yards

**088768 BRUECKEN IN GROSSVER-SCHIEBEBAHNHOEFEN.** [Bridges in Large Marshalling Yards]. Large marshalling yards serve to rationalize shunting operations and require, in addition to the construction of sets of classification tracks, the construction of arrival and departure tracks, as well as reconstruction of the passenger track network in the area occupied by the marshalling yard. The required nonintersecting movement of various types of traffic, of necessity, dictated the construction of numerous new railroad and road bridges, as is illustrated in this paper by the recently completed central marshaling yard of Vienna and the Villach Sud marshaling yard, which is still under construction.

In German.

John, Edgar (Potucek, Walter). *OIAZ Oesterr Ing Archiv Z* v 132 n 11-12 Nov-Dec 1987 p 407-413.

**088769 MODERNISATION DU TRIAGE DE VENISSIEUX.** [Modernization of the Venissieux Marshalling Yard]. The considerable volume of freight traffic handled in the area of Venissieux, on the outskirts of Lyons, led to the decision by the management of the SNCF Lyons Region to modernize the existing marshalling yard, dating from 1928, which had undergone little change since then. The modernization scheme has cost 120 million francs and will enable the number of train formation sidings to be increased from 18 to 24, car braking to be automated by the installation of car retarders on each sorting siding and the operation of the points to be modernized. The modernized marshalling yard was inaugurated for the summer service of 1988. It will enable the many customers working from the area to benefit from more numerous direct services and the organization of local services to be adapted to requirements as and when necessary. (Edited author abstract). In French.

## Computer Aided Design

**088770 COMPUTER AIDED DESIGN (CAD) IN A MODULAR DESIGNING OF TRACK LAYOUT IN RAILWAY STATIONS.** The principal structural features of the newly-developed method are modular; the matrices of the co-ordinates of each unit track section are calculated within two orthogonal co-ordinate systems; it is structurally programmed in BASIC; use has been made of procedures permitting an optimization of a possibly large part of the track layouts to be designed. The functional features of this method are: use can be made, for design purposes, not only of professional micro-computers but also of home ones (C-64); an interactional calculating method. An example is discussed to illustrate this approach. 12 Refs.

Baluch, H. (Polish State Railways, Pol). *Rail Int* v 19 n 6 Jun 1988 p 31-37.

## Design

**088771 RAILWAY ARCHITECTURE AND THE BRUNEL AWARDS.** The article addresses the question of why there is going to be a considerable change in station architecture. It examines history and the reasons why stations have developed in their present form, the factors that influence that form and their comparison with the factors which will cause this change in the whole concept of a station. It also shows how the Brunel Awards have been developed to encourage this change in design concept.

**Equipment** See Also RAILROAD TRANSPORTATION—Freight.

**088772 MOBILE SPIKE RECLAMATION.** The Spike Reclaimer picks up used spikes, cleans them, and sets them back down for reinstallation. The Reclaimer consists of a tumbler, jib crane, canopy, and a push car. The Reclaimer moves down the track at approximately 300 feet per minute, its magnetic, 5-foot-diameter wheels picking up any spikes left by the spike puller. The spikes are then carried to a chute and dropped on a conveyor belt which takes them to the cleaning tumbler. At 15 revolutions per minute, the 5-foot tumbler contains about 800 spikes, and as spikes are added at the front of the tumbler, the cleaned spikes overflow at the rear of the tumbler on a continuous basis.

**088775 DISASTERS SUFFERED (DURING THE PAST TWENTY YEARS) AND MEASURES AGAINST THEM.** The author notes a steady and substantial decline in the number of disasters that have occurred on Japanese railways over the past 20 years. More than 8,000 disasters per year in the mid-1960s have been reduced to a range from 1,000 to 1,400 occurrences for the past 1 or 2 years, which is a decrease to about 1/6 in 20 years. Measures that have been taken to prevent the occurrence of bridge collapses, landslides, rockfalls, track flooding and clay intrusion are reviewed.

## Air Conditioning

**088777 ADVANCED AIR-CONDITIONING SYSTEM FOR TRAINS.** Roughly 85% of all commuter trains in the Tokyo metropolitan area are air-conditioned. However, since train air-conditioning equipment is generally automatically controlled, with on-off operation performed intermittently, very precise temperature control is not possible. For this reason, the passenger environment tends to be either too cool, or, during seasonal heavy rains, too hot and humid. Nowadays, with advances in microprocessor-control technology and variable-speed motor control, we are witnessing an evolution from merely cooling railcar interiors to very precise control of cooling and humidity, making it possible to respond more flexibly to demands for greater passenger comfort. And, if entire integrated systems are developed, including power supplies, the equipment can be made more compact, lightweight, and energy-efficient. Some air conditioning system test results are included.

**Austria** See Also BRIDGES, RAILROAD—Reconstruction; RAILROAD PLANT AND STRUCTURES—Construction.

**088779 150 JAHRE EISENBAHNEN IN OESTERREICH.** [150 Years of Railways in Austria]. The year 1837, on the 23rd November of which a passenger train hauled by a steam locomotive ran from Floridsdorf near Vienna to Deutsch-Wagram, is the beginning of the railways in Austria. Soon afterwards, numerous north-south and east-west connections were built. Also after the introduction of electric traction in 1904, the development of the motive power units was always influenced by the predominantly mountainous character of the Austrian landscape with its numerous upgrades and downgrades and often narrow curves. This article describes the history of the railways in Austria by highlighting the development of the rail vehicles and ends with a look at the future of Austrian Federal Railways which have launched extensive projects designed to make the railways of Austria a reliable link in a European long-distance network. (Edited author abstract) In German.

Haintz, Helmut (Oesterreichische Bundesbahnen, Vienna, Aust). *Z Eisenbahnes Verkehrstechn Glaser Ann v 111 n 11-12* Nov-Dec 1987 p 350-362.

**088780 LONG DISTANCE PASSENGER TRAFFIC: THE RAILWAY AT A WATERSHED: NEW OPPORTUNITIES IN LONG-DISTANCE TRAFFIC.** The Austrian Federal Railways (ÖBB) are opting for fundamental and far-reaching modernization and structural modification, which are essential if the railway is to constitute an attractive and environment-friendly alternative among the transport modes in the market. To increase market share, ÖBB is proposing to introduce two classes at high-speed trains - namely, EuroCity (EC) trains for travel between major cities in Austria and abroad, and Intercity (IC) trains for travel between large Austrian cities. Maximum running speeds of 200 km/h are planned for EC and IC trains, which will give revenue speeds of up to 160 km/h and achieve considerable cuts in today's

journey times. In addition, ÖBB are planning Interregio trains as feeder services for the EuroCity and Intercity trains: the rolling stock used in them will permit running speeds of up to 160 km/h, giving revenue speeds of up to 100 km/h.

Sittler, H. (Oesterreichischen Bundesbahnen, Austria). *Rail Int v 13 n 10* Oct 1987, Int Environ Symp: Eur Railw - An Asset for the Environ, Mannheim, West Ger, Oct 22 1987 p 5-7.

**088781 COMBINED TRANSPORT: THE NEED FOR ENVIRONMENT-FRIENDLY TRANSPORT THROUGH THE ALPS.** Whereas in 1970 rail and road handled roughly equal proportions of freight traffic in transit through Austria, stagnation in the volume of rail transport has meant a fourfold increase in road traffic. The main burden is borne by the Inn Valley-Brenner route which handles some 42% of all holiday transit traffic (i.e., some 8 to 9 million private cars per year) and 75% of all road freight transit traffic. As a direct result, the Austrian Federal Government has devised a transport corridor concept giving priority to combined transport and conventional rail transport to relieve congestion on transit routes across Austria. In connection with the Brenner route, the Austrian Government is sponsoring measures to enlarge tunnels to UIC C/1 gauge, improve signalling and operating techniques so that train headway can be shortened, driven the line around Innsbruck and introduce new, still to be developed heavy tandem multicurrent locomotives to remove the need for a further locomotive at the start of the Brenner gradient and for a change of locomotive when crossing the frontier into Italy.

**Automatic Train Control** See Also CARS—Street Railroad; RAILROAD ROLLING STOCK—Control; RAILROAD TRANSPORTATION—Traffic Control.

**088782 ATCS HARDWARE GOES IN TO PROVE CONCEPT.** On one point, all of the major US and Canadian railways are agreed: the projected returns on investment in advanced train control systems look very attractive indeed. Union Pacific - often regarded as an industry leader when it comes to innovative technology - has already decided to install a Level 30 system throughout its 264 km North Platte subdivision, and Canadian Pacific expects to have all the elements of Level 30 in operation next year on its 320 km line between Calgary and Edmonton. Many other lines have hardware on test. Indeed, the installation of conventional CTC is rapidly winding down in the belief that ATCS offers the opportunity to do a much better job at lower capital and maintenance cost.

**088783 AUTOMATIC TRAIN CONTROL SYSTEM - HONG KONG MASS TRANSIT RAILWAY CORPORATION.** This paper will give an overview of the automatic train control system used on the mass transit railway system. This topic will be covered, firstly, by outlining the reasons for the use of automatic train control systems and the basic principles of system design that required to be adopted. The emphasis will be placed on the Trainborne system and equipment.

Gaffney, Phil (Hong Kong Mass Transit Railway Corp). *Meas Control v 20 n 7* Aug-Sep 1987 p 104-110.

**088784 RIO GRANDE: TESTBED FOR C&S INNOVATION.** General Railway Signal is running multiphase tests of its SPACERAIL vital radio-based signal and control system over about 150 miles of Denver & Rio Grande Western railway line. Now, the cooperative testing arrangement on SPACERAIL is well into its second phase, after completion last July of Phase 1 work which consisted primarily of demonstrations of the system's ability to read track-based transponders reliably and of the ability to communicate effectively using the existing train radio network. In Phase 2, the objectives are to

demonstrate the system's ability to nonvital control movements based on zone occupancy data and existing CTC interlocking data. For this phase, a partial signal system will be emulated on Rio Grande's 38-mile line between Bond, Col., and Phippsburg.

Welty, Gus (Railway Age, New York, NY, USA). *Railw Age v 188 n 10* Oct 1987 p 51-52.

**088785 TRAIN SPEED CONTROL BASED ON TRACK MAINTENANCE CONDITION, RAINFALL AND EARTHQUAKE.** Japanese National Railways (JNR) developed a train speed control system on the basis of track maintenance conditions, rainfall and earthquakes in order to ensure safe operation of Shinkansen trains, which run at speeds of over 200 km/h. For Shinkansen train speed control adjustment based on track maintenance condition, inspection trains measure the track condition once every ten days. In the event of heavy rain, trains are stopped when the rainfall per hour or the continuing rainfall in a day exceeds specified value. To monitor earthquakes, seismometers are installed along the Shinkansen track. (Edited author abstract)

**088786 NEW SHINKANSEN MU CARS CLAIM-ABLE TO BE AN 'INTELLIGENT TRAIN': INFORMATION SYSTEM WITH SHINKANSEN MU CARS.** A new series of Shinkansen MU cars is provided with various information systems. With the conventional series, the main information system was a train radio system which was used mainly for train dispatching and only partially for common telephone service to onboard passengers. The new 'Series 100' MU train is also equipped with other information systems, such as a monitoring system, an onboard passenger guidance system, and automated public address system and a radio broadcasting relay system. In 1989, the ground facilities for the train radio system will adopt LCX (leaky coaxial cables), and the onboard passenger telephone service will be reinforced.

Ishikawa, Sakae (Central Japan Railway Co, Jpn). *Jpn Railw Eng v 27 n 2* Sep 1987 p 10-13.

**088787 TRAIN OPERATION CONTROL IN THE FUTURE.** In order to revitalize railways, future planning and radical changes to train operation control systems are needed. For this, it is necessary to operate trains flexibly with fewer staff members, and also to introduce telecommunication technology and information processing technology efficiently, with full consideration of the costs and maintenance work for operation control systems. The concept which the author proposes is to operate trains with intelligence by means of terminals with intelligence, such as electronic interlocking systems. The system executes the decentralized control of trains and stations, with centralized supervision and regulation. Various kinds of technology have reached satisfactory levels for implementation of the proposed system. (Edited author abstract)

Sasaki, T. (Japanese Natl Railways, Jpn). *Rail Int v 19 n 1-2* Jan-Feb 1988 p 49-51.

**088788 FEC: SYSTEM-WIDE WITH ATC.** The freight-only Florida East Coast Railway has begun preliminary work that will lead to installation of an ATC system on its Jacksonville-Miami main line. Harmon Industries is supplying the equipment, both on-train and off. FEC is getting a total hardware package from Harmon, which will include Electro Code 4 microprocessor-based dc-coded track circuitry. Harmon's Phase Motion Detector system for grade-crossing protection, along with some Harmon Crossing Processor equipment, and the manufacturer's Locomotive Speed Limiter in its Ultra-Cab 40 design.

**088789 AUTOMATISCHE ZUGKONTROLLE - ATC-SYSTEM - BEI DEN DAENISCHEN STAATS-BAHNEN.** [Automatic Train Control (ATC) System for the Danish State Railways]. This paper describes the development of an automatic train control system which has been specifically designed for the signalling system and the rolling stock of the Danish State Railways. The objectives, the strategy for the gradual introduction of the ATC system, the technical solution, the safety requirements and the time schedule are discussed. (Edited author abstract) In German.

Frosig, Poul (Daenische Statsbahnen, Copenhagen, Den). *Z Eisenbahnes Verkehrstech Glasers Ann* v 111 n 11-12 Nov-Dec 1987 p 474-481.

**088790 NEC: THE ROCKY ROAD TO ATC.** The Federal Railroad Administration has now completed administrative action to start a process that should result in the elimination of non-Automatic Train Control freight operations on the Washington-Boston spine of the Northeast Corridor by July 1, 1990. Conrail has requested bids from numerous suppliers for prototypes, to its performance specifications, of a 'braking profile system.' Similar to conventional ATC in requiring that any change to a more restricting signal indication will result in an automatic brake application if not acknowledged within eight seconds, after acknowledgement BPS leaves control of the train with the engineer, provided that he keeps train speed within a profile that will satisfy the signal indication.

Armstrong, John H. (Railway Age, New York, NY, USA). *Railw Age* v 189 n 3 Mar 1988 p 61-62.

**088791 ECONOMICS OF AUTOMATIC TRAIN CONTROL IN SWEDEN.** From 1980 to 1985 a new fail-safe intermittent ATC system has been introduced in Sweden, today covering 90% of the Swedish traffic. The system helps the driver by giving him information and intervenes in case of danger. The investment costs exceed 400 MSEK (million Swedish kroner) and the annual costs are approximately 7 MSEK. With the ATC system it has been possible to simplify tracks and optical signals. ATC as a basic component in the signalling system will also facilitate many profitable future functions, for example, centralized systems using transponders for train position indication and radio for transmission, but the primary aim of ATC was to increase safety, and this aim has also been achieved. (Author abstract)

**088792 DEVELOPMENT OF AN ON-BOARD ENERGY-SAVING TRAIN OPERATION SYSTEM FOR THE SHINKANSEN ELECTRIC RAILCARS.** The authors have studied energy saving train operation methods for the Shinkansen electric railcars and propose a simple and effective one which can be implemented in a microprocessor-based on-board system for assisting the motorman's operation. Running tests of the accommodation train service for comparing energy consumption between the motorman's actual train operation and the proposed method using this on-board system were carried out on the Tohoku-Shinkansen line. In these tests, whose scheduled running time had about 6% of margin to the planned minimum running time, about 10% energy saving was obtained by the proposed train operation method with a high precision of on-schedule control. (Author abstract) 2 refs.

**088793 BN AND ARES: 'CONTROL' IN A NEW DIMENSION.** If the Advanced Railroad Electronics System (ARES) proves to be only equal to the sum of its parts - seven major subsystems - it will be a substantial accomplishment in railroad communications, command and control. But Rockwell International's ARES, now well along in testing on Burlington Northern, may turn out to be greater than the sum of the parts. The heart of ARES is the data management system, with its main

element an on-board data management unit that provides for both the integration and automation of information exchange among the various on-train systems and the interface with the ground-based ARES system. ROCS, an advanced control and dispatching system, generates orders, does safety-monitoring, determines compliance with instructions, optimizes the flow of traffic and helps the dispatcher in making his decisions. In its present configuration, the ROCS work station has five multiple-color CRT displays. The train location system has attracted the most attention, mainly because of its use of the Navstar Global Positioning System (GPS).

**088794 AUFSTELLEN VON BREMSTAFELN FUER STRECKEN MIT LINIENZUGBEEINFLUSSUNG.** [Compilation of Braking Charts for Lines Using Continuous Inductive Automatic Train Control]. The German Federal Railway's lines and rolling stock for speeds above 160 km/h are equipped for continuous inductive automatic train control (ATC). For the practical application of the continuous inductive ATC scheme, so-called braking charts are required which define the relationship between stopping distance, permissible speed, percentage of brake power and route gradient. The railroad has set up braking charts for gradients of 0, 5 and 12.5%, which apply for speeds up to 300 km/h and percentages of brake power of 100 to 240. The method used in setting up the braking charts is described. A specification for brake performance weighting (based on percentages of brake power) for speeds from 160 to 300 km/h was developed as well. In addition, the railroad has prepared a table for determining the brake characteristic to be preset in a continuous inductive ATC system, taking into account the permissible speed, the available brake percentage and the gradient. (Edited author abstract) 5 refs. In German.

## Computer Aided Design

**088797 20 JAHRE GEOMETRISCHE DATEN-VERARBEITUNG BEI DER DEUTSCHEN BUNDESBAHN.** [Twenty Years of Geometrical Data Processing on the German Federal Railway]. A computer-aided automatic drawing system called geometrical data processing was introduced on the Federal German Railway in 1967. This has enabled technical plans and drawings, and graphical presentations of figures in the form of bar charts and graphs, to be produced automatically with the aid of precision drawing apparatus, supported by a comprehensive and complex set of software. The effectiveness of the automatic drawing system could be further enhanced in conjunction with CAD systems. (Edited author abstract) In German.

Keitmann, Hans Peter (Deutschen Bundesbahn, Frankfurt am Main, West Ger); Schwick, Ludwig. *Eisenbahntechnik* v 39 n 1 Jan 1988 p 24-27.

## Computer Applications

**088798 FUNCTIONAL TESTING OF MICROCOMPUTER RAILWAY INTERLOCKING EQUIPMENT.** The tests are carried out under real circumstances or by their simulation. Simulation is an excellent method if the tests to be performed on real systems are too expensive, slow or dangerous to the environment. Taking this into consideration it is worthwhile to test the station interlocking systems by the simulation of their operation and the railway traffic without connection to on-site equipment. (Author abstract) 4 refs.

Tarnai, G. (Technical Univ, Budapest, Hung). *Period Polytech Transp Eng* v 15 n 2 1987 p 161-169.

**088799 APPLICATIONS OF COMPUTER SYSTEMS TO RAILWAY SYSTEMS.** The recent technological refinements and plummeting costs of computer systems have proved a great boon to railway and other transportation systems. The uses of computers in railway systems are not limited to the usual tasks (accounting, salary calculations, etc.) but also extend to many operations peculiar to railway systems, helping to raise efficiency and cut manpower requirements. This article outlines the Corporation's achievements in applying computers to tasks exclusive to railway systems such as train operation, the supply of electric power to trains, and depot and station management.

Takahashi, Keichi (Mitsubishi Electric Corp, Tokyo, Jpn); Nagashima, Makoto. *Mitsubishi Electr Adv* v 43 Jun 1988 p 6-7.

**088800 TRAIN-INFORMATION MANAGEMENT SYSTEM.** The vigorous application of power semiconductor devices and computer technology has brought many benefits for on-board train equipment and systems, improving overall performance, enhancing reliability, supporting more sophisticated functions, and cutting energy and manpower requirements. By serial linking of all on-board equipment, the entire train and all its equipment can be regarded as a single integrated system, and train information managed in a coordinated, unified manner. Such a scheme enables great simplification of I/O interfaces, and eliminates the need for many of the fittings and connection boxes previously required. The adoption of such train-information management systems (TISs), which enable the reorganizing and streamlining of on-board equipment and functions in a simplified configuration, is under way in Japan and elsewhere. This article describes the construction, functions, and features of a TIS

recently delivered for use in Australia. Mitsubishi Electric has also delivered a TIS employing a fiber-optic serial-data line for use on subways in Japan.

## Construction

**088801 UNDERPINNING CONSIDERATIONS FOR DESIGN UNIT A-140, METRO RAIL TRANSIT PROJECT.** The proposed rail transit system, Section A-140 of the Southern California Rapid Transit District, consists of two cut-and-cover stations and approximately 1.5 mi of twin bore tunnel. Along the proposed alignment are numerous structures many of whose foundations rest above the invert of the proposed tunnels or adjacent to the proposed station excavation. Consideration is given to protection of structures along the proposed route. The influence zones for tunnel mining and station excavation, based on design criteria, available literature, and past experience, are established. Settlements of the buildings within the influence zone are predicted and compared with the estimated allowable settlements. Those buildings whose predicted settlements exceed allowable settlements are thereby identified. (Edited author abstract) 9 refs.

Hampton, Delon (Delon Hampton & Associates Chartered, Washington, DC, USA); Jin, J. Scott. *Transp Res Rec* 1104 1986 p 18-25.

**088802 COMPUTERIZED PROJECT PLANNING.** Since its introduction in the late 70's, PLANTRAC software has been used for construction, plant engineering and other applications at some 1500 sites around the world. In New York, London and Istanbul, the software package is currently helping to manage railway construction and rehabilitation programs. One of the software's key features is its capability to analyze and present in the form of discussion documents the different responsibilities of various departments such as civil engineering, architecture, and mechanical engineering. The printouts are formatted to fit a standard form; and each provides start and finish dates as well as the float and current status of each activity. With the Computerline software, network diagrams are used to draw up work plans and then to monitor progress against it.

## Cuba

**088803 CUBA STRIVES TO RAISE RAIL CAPACITY.** The end of the 1970s and the early 1980s saw the launching of Cuban Railway modernization program. Since then, the principal objective has been to rebuild the standard gauge central main line from Habana to Santiago de Cuba. The intention is to cut journey times, with maximum speed of passenger trains raised initially to 140 km/h; freight will run at 100 km/h. A second phase of work will in due course raise the line speed ceiling to 200 km/h on certain parts of the route. Work entails complete reconstruction of the track which is being relaid with 50 kg/m rails and monobloc concrete sleepers. About 70 per cent of the formation has had to be rebuilt, with curve radii increased to 2,000 m and steepest gradients reduced to 1.2 per cent. Large numbers of level crossings are being replaced by bridges, while marshalling yards and freight depots are being enlarged, the objective in this case being to bring about a major increase in capacity.

**088804 FREIGHT TRAFFIC: RAILWAYS: A SAFE, ENVIRONMENT-FRIENDLY MODE FOR THE CARRIAGE OF DANGEROUS GOODS.** Rapid growth in the dangerous goods transport sector and the attendant problems and risks have further highlighted the fact that safe carriage of such goods is important, not just for those directly concerned, but also for the community as a whole. Recent headline-hitting events have focused attention on the relative merits of the different modes in terms of safety and potential threats to the environment for the carriage of dangerous goods, and here the railway comes out well. The essential thing is to make this fact clear in discussions and, above all, to illustrate the possibilities for improving safety and reducing the risk of pollution inherent in the carriage of dangerous goods by the use of modern technology. Remarkable developments in this connection are illustrated in this paper concerning the transport of such goods on the Danish State Railways.

**088805 INTERNATIONAL ENVIRONMENT SYMPOSIUM: EUROPE'S RAILWAYS - AN ASSET FOR THE ENVIRONMENT.** This conference proceedings contains 13 papers on the railway as an environmentally friendly mode of transport and state-of-the-art technical developments by railways to protect the environment. Of the papers presented 2 are in German and the rest in English. Topics discussed include the marketing of long-distance passenger train service, the expansion of suburban train service in the Zurich area, regional passenger service in France, upgrading rail freight service in the province of Tyrol in Austria, the transporting of hazardous freight in Denmark, the construction of new high-speed railway lines in the Federal Republic of Germany, the construction of a new high-speed passenger rail line in France, a new local railway line serving new suburbs of Amsterdam, research on railway-related noise and railway-induced ground vibrations, the railroad as an energy-efficient mode of transportation, a cost/benefit analysis of expenditures on railroad safety measures, and the role of occupational medicine in protecting railway workers. All papers are indexed and abstracted separately. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11122 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**088807 DER TGV ATLANTIK UND DIE GEGENWAERTIGEN PERSPEKTIVEN EINES EUROPAEISCHEN HOCHGESCHWINDIGKEITSNETZES.** [TGV Atlantique and Current Prospects of a European High-Speed Network]. Following trials with prototype trains, normal production of the TGV Atlantique trains has now been started. The first train is scheduled for delivery to the French National Railways (SNCF) in 1988. In the meantime, SNCF is developing plans for linking the two new lines (South East and Atlantique) to the proposed Northern and Eastern lines thus creating a French high-speed network. A European high-speed network comprising TGV services is being envisaged for the time horizon around the year 2000. However, to this end, numerous problems due to the different technical and operational conditions of the European railways have to be solved. (Edited author abstract) In: German.

Lacote, Francois (SNCF, Paris, Fr). *Z Eisenbahnes Verkehrstechn Glaser Ann* v 111 n 11-12 Nov-Dec 1987 p 371-374.

**088808 TGV ATLANTIQUE: A NEW LINE FOR 22 MILLION INHABITANTS.** Work on the new high-speed TGV Atlantique line started in 1985 and has followed the anticipated schedule with opening of service planned in two stages: the western branch to Le Mans in 1989, and the south west branch to Tours in 1990. Time saving of the order of one hour, will put Rennes and Nantes within two hours of Paris, Bordeaux within three hours, and Toulouse within five hours. An innovation is represented by increased comfort thanks to a new suspension with pneumatic membranes with variable transverse flexibility and by a radical transformation of damping connections between coaches. Then there is innovation or rather revolution in traction thanks to the new autopiloted synchronous electric engine. The 'Atlantique' will travel at 300 km/h with a power of 10,400 kw distributed between 8 engines, compared to the TGV Sud-Est train which develops only 6000 kw at a speed of 270 km/h with 12 engines of the same mass and size.

Anon. *Rail Eng Int* v 17 n 1 1988 p 4-5, 7.

**088809 REGIONAL TRAFFIC: SNCF AND THE REGIONS - A PARTNERSHIP FOR SUCCESS.** Regional rail services are one of the key components that characterize the true dimension of the SNCF public service function. They concern over 600 lines, adding up to some 26,000 km of track on which these services very frequently have to coexist with fast and express trains, and which play a vital role in local community life. With the new TER train sets, the rolling-stock fleets of the regional railways are being renewed for use on modern, new, bright-liveried, comfortable and high-performance regional trains. Over 50% of the regional railway rolling-stock will have been renewed by 1990.

## India

**088811 INDIAN RAILWAYS ON THE WAY TOWARDS A MODERN TRANSPORT SYSTEM.** Indian Railways operates the largest railway network in Asia and the fourth-largest in the world (after the USA, the USSR and Canada) and taken as a single enterprise constitutes the world's second-largest railway company. The main emphasis of Indian Railways' development program is on the track itself: expansion, strengthening for improved performance, maintenance safety, also including switches, structures such as bridges, and all other installations and equipment of direct relevance to the track. The laying of long welded rails, continuously welded track and track construction mechanisation using modern permanent way machinery and equipment are on the increase. For many years now, absolute priority has been attached to the electrification of the heavily-used main lines. Since about 1951 there has been a gradual conversion of all the principal trunk lines, in particular on the 'rectangular' main network (comprising the Bombay-Delhi-Calcutta-Madras-Bombay lines) from 1500-volt dc to the more powerful and above all cheaper-to-install 25 kV/50 Hz single-phase 'industrial' ac system.

Stier, Guenter (Bundesverband Deutscher Eisenbahnen, Cologne, West Ger). *Rail Eng Int* v 17 n 1 1988 p 12-13, 15-16.

## Industrial

**088812 SAMMELN UND VERTEILEN SCHWEPUNKT DER AUFGABEN VON WERK- UND INDUSTRIEBAHNEN.** [Collection and Distribution - Key Assignments for Industrial and In-Plant Railways]. The costs involved in short-distance haulage, i.e., costs originating in collecting and distributing the merchandise, today account for most of the costs in railway haulage. A description is given here of Gemeinschaftsbetrieb Eisenbahn und Hafen (EH) which hauled a total of 60 million tons in fiscal 1986/87, with more than one third of this tonnage taken care of by DB (German Federal Railways) in cooperation with EH while two thirds were hauled by EH. An outline is given of the particular requirements governing the collecting and distributing operation. Further details are provided on the remotely controlled railway movements at EH and the 'PRODIS' program system which is being adopted as a computer-assisted means of organization, positioning, information and control to supply local control stations. In German.

## Insulation

**088813 USE OF CELLULAR PLASTIC IN SWEDISH RAILWAYS TO INSULATE THE TRACK AGAINST FROST.** The history of the use of insulation against frost in railways is briefly described. The properties of the best material currently available - extruded cellular plastic of polystyrene (Styrofoam, Styrodur, Eco-prim) - are described. Stress-strain curves are also detailed, showing the highest limits allowed for deformation and

the lowest breaking force allowed for material in a railway track. Dynamic tests and tests with different petroleum products are also described. The paper also deals with the application of the material to the track. The value of extruded cellular plastic as insulation against frost damage with different applications is reviewed. In this respect it is noted that only prescribed qualities are used and that the materials are continuously controlled at delivery. (Edited author abstract). 4 Refs.

Sandergren, Erik (Swedish State Railways, Stockholm, Swed). *Transp Res Rec* n 1146 1987 p 28-32.

Italy See Also RAILROAD TRANSPORTATION—Italy.

**088814 FS ACCELERATES PLAN TO DEVELOP ALTA VELOCITA CONCEPT.** Italian Railways (FS) is now showing determination to press ahead with plans to introduce a national network of high speed lines. FS' Alta Velocita (high speed) project was conceived as a way of consolidating development already in hand and at the same time relaunching intercity rail transport throughout Italy. The plan is to develop a T-shaped network linking Torino, Milano and Venezia in the north with Firenze, Roma and Napoli to the south. The partly-completed Roma - Firenze direttissima forms a key link in the chain, but already plans are being developed for third and fourth lines to round out the network. Massive new line construction lies at the core of the AV project, but much more is involved. Along with the new lines will come a new generation of 300 km/h rolling stock in the shape of the ETR500 trainsets, with the tilting ETR450 fleet providing a 250 km/h stopgap before eventual use on connecting services to areas off the new line network.

Anon. *Railw Gaz Int* v 143 n 12 Dec 1987 p 822-823.

**088815 SISTEMA FERROVIARIO ITALIANO AD ALTA VELOCITA: STUDIO DI FATTIBILITA** [High Speed Italian Railroad System: Feasibility Study]. This study completed in June 1986 was prepared by a working group of the Italian State Railroads (FS). It consists of three parts: General Report (presented in a condensed version), Demand and Supply, and Technical Proposal (presented in full). The main suggestion is the construction of two trunk high-speed lines: Milan-Naples via Bologna, Florence and Rome, and Turin-Venice via Milan and Verona. The General Report discusses various possibilities of increasing the speeds, or particular sections, the potential commercial traffic and the principal project options. The Demand and Supply section discusses the traffic volumes, present and future, and the possible improvements, especially as to the running times between the main traffic nodes, such as Milan and Rome and the rest of Italy attempting to develop an optical solution. The last section, Technical Proposal, considers the infrastructure necessary to implement the project, presenting plans for some new track routes, urban functions, electric traction and signaling, rolling stock and maintenance solution. In Italian.

**088816 REVISION OF TRAIN DIAGRAMS IN JR GROUP AFTER ONE YEAR OF OPERATION AS PRIVATE RAILWAYS.** In interurban transportation, the latest revision of train diagrams for the recently divided and privatized Japanese National Railways indicates the through trains for the first time between Honshu and Hokkaido and between Honshu and Shikoku, and reinforces the high-speed railway network of Shinkansen and conventional lines by increasing the number of trains and greatly reducing interurban travel time. In urban transportation, an increase in the number of trains, train speedup and improvement in train connection are easing traffic congestion in commuter trains, making the train diagrams easier to use, and thus improving transportation

services. As a result, the scale of revision of train diagrams of the JR Group as a whole is represented, in terms of the number of trains per day, by an increase from 469 to 527 for Shinkansen trains, from 1,141 to 1,208 for conventional-line limited-express and express trains, from 20,003 to 21,891 for conventional-line ordinary trains, and from 808 to 836 for freight trains.

Tokairin, Tamotsu (East Japan Railway Co, Jpn). *Jpn Railw Eng* v 27 n 4 Mar 1988 p 1-4.

**088817 SHINKANSEN NOISE: RESEARCH AND ACHIEVEMENTS IN COUNTERMEASURES FOR SHINKANSEN NOISE.** In 1982, the Tohoku and Joetsu Shinkansen lines were opened. The result is the present Shinkansen network that runs through Japan from north to south, leading to improvement in railway services, together with the provision of new, efficient connections with conventional lines. The problems of noise and vibration from Shinkansen train operation were posed mainly in relation to railway viaducts in urban areas. The Japanese National Railways (JNR) has made efforts for noise reduction, obtained many achievements, and put them into practical use on the Shinkansen lines. In the early stage of studies, there were many virgin areas for JNR staff, such as measurement technology, estimation methods, and noise alleviation technology. With the start of full-scale testing at a general test center in 1975, various studies and the development of effective measures made a great step forward. In March 1985, the maximum speed on the Tohoku Shinkansen was increased to 240 km/h. (Edited author abstract)

**088818 DAS INTERESSE DER DEUTSCHEN WIRTSCHAFT AM TRANSPRAPID.** [Interest of German Trade and Industry in the Transrapid System]. The Federal Ministry of Transport commissioned, in 1969, the Study of High-Performance High-Speed Rail Systems. Within the framework of this study the conclusion was reached that the development of a magnetic levitation system would be of practical relevance with regard to transport policy and the national economy. Primarily involved in the development of magnetic levitation technology are those industrial enterprises which have a tradition of transportation engineering. Included among these is also Thyssen Industrie AG Henschel in Munich, which has been prominently involved in the development and construction of the Transrapid and of the test facility in Emsland, Federal Republic of Germany. The characteristics and advantages of the magnetic levitation system, as well as the milestones in the history of its development, are discussed in detail; future possibilities of using and marketing the Transrapid are described. In German.

Raschbichler, Hans Georg (Neue Verkehrstechnologien, Munich, West Ger). *Thyssen Tech Ber* v 20 n 1 1988 p 75-80.

**088819 EINSATZFELDERSTUDIE USA KORRIDOR LAS VEGAS-LOS ANGELES.** [Regional Application Study USA Las Vegas-Los Angeles Corridor]. By including magnetic levitation technology in international planning at an early stage, the advantages of this new system can be demonstrated. In this connection, the results of the studies on the Las Vegas-Los Angeles link are of special importance. They speak in favour of a magnetic levitation system when the transrapid magnetic levitation system and progressive wheel-on-rail systems are compared. The characteristics of the magnetic levitation system are described, and a detailed account is given

of the study phases between 1982 and 1987. The opening of the Las Vegas-Los Angeles line is envisaged even before 1995. 8 Refs. In German.

**088820 DEZENTRALE ENERGIEVERSORGUNG FUER DEN LANGSTARORANTRIEB-WEITERENTWICKLUNGSPOTENTIAL FUER DIE M-BAHN.** [Decentralized Power Supply for Linear Motor Applications. Further Developments Potential for the Magnetic Railway.]. The known advantages of linear motors are further reinforced by decentralizing the power supplies. The components of the line motor will be fed with direct current, which will be converted first directly on the spot. There are noteworthy reductions in problems of layout and changes to service programs. A good measure of redundancy is a further advantage, as is an increase in safety. The energy consumption is lower than with centrally fed motors, because only the motor sections which have an immediate traction-generating function will be energized. These advantages are of special importance in transport-engineering applications in the industrial sector, for example, for underground use in coal mining. (Edited author abstract). In German.

**088821 ALLOCATING RAILROAD MAINTENANCE FUNDS BY SOLVING BINARY KNAPSACK PROBLEMS WITH PRECEDENCE CONSTRAINTS.** The United States is faced with allocating funds from a limited budget to the repair or replacement of railroad track segments on military bases. The problem can be modeled as a very large binary knapsack problem having a single budget constraint and multiple precedence constraints. A procedure has been developed to convert this original problem into an equivalent knapsack problem with a single constraint and significantly fewer variables. The new knapsack problem, still too large to be solved optimally, is then solved efficiently by a heuristic which provides answers within a few percent of optimality. Furthermore, the quality of the solution improves with the size of the problem. (Author abstract) 16 refs.

## Management

**088822 OUTLINE OF JR-NET.** This article describes JR-NET, which enables various systems of the JR group of privatized Japanese railways to exchange data. JR-NET is a large-scale computer network consisting of a packet-switching system, which forms the core of the network, a data processing system, a facsimile switching system and a network supervisory and control system. The network covers the whole of Japan, and the number of subscribed hosts and terminals is now about 2500. (Edited author abstract)

## Modernization

**088823 LES RESEAUX A GRANDE VITESSE DANS LE MONDE.** [High-speed Railway Networks in the World.]. The development of truly high-speed transport networks superimposed on existing networks is a recent phenomenon. Japan led the way in the construction of high-speed lines when, to the Tokyo-Osaka Shinkansen opened on 1st October 1964, was added the following year the second section of the Tokyo-Osaka-Kobe motorway. At the present time Japan has more than 1,800 km of

railway lines suitable for 210 and 240 km/h operation, as well as airline services and motorways over the same routes. In 1981, the TGV was added to the airline services and motorways on the French southeast axis to form the first European high-speed network. A second European high-speed network will open in 1989 on the Atlantic front, to be followed by others in the North of France, West Germany, Italy, Britain, Spain, Austria, Sweden and Switzerland. The North European TGV and the Channel Tunnel will contribute to form a grid of European high-speed networks. (Edited author abstract) In French.

## Monitoring

**088824 OPERATIONAL EXPERIENCE OF THE MICROCOMPUTER REMOTE MONITORING INSTALLATIONS USED BY THE MAV.** A remote monitoring installation produced in the MMG-Automatik workshop was introduced in 1986 on the Hatvan-Miskolc-Mezozombor line of the Hungarian Railroads. This installation also uses single-processor systems in the stations. The amount of information collected has been increased considerably. A multi-processor system with eight processors is in place in the computer center. One processor operates as a monitor/processor and two of them provide data transmission. One processor controls the seven auxiliary processors that switch the lamps (more than 8000) in the recording panel. The other processors have arithmetical tasks. The installations will provide a large number of services: acknowledgments to the recording panel, displays with magnification, displays to show the timetable with train numbers, printers to register the timetable and records (e.g. switching on replacement signals, trailing points). For the time being, only acknowledgments to the recording panel are switched. (Edited author abstract)

**088825 NEW LINES: THE NEW FLEVO LINE, AN ENVIRONMENT-FRIENDLY PROJECT.** In 1987 Netherlands Railways (NS) began operations on the first section of a new suburban railway line to Almere new town. The whole line is due for completion in 1988. The line in question is the so-called 'Flevo Line' that is being built out to Lelystad in the heart of the IJsselmeer polder area. The authors describe how allowance was made in this project for environmental considerations. At the time it was not yet mandatory in the Netherlands to examine the impact of this type of project on the environment, but the NS may be said to have acted as precursors in this respect, so that the project can be described as environmentally friendly. The measures taken include nature conservation measures, noise abatement measures, and measures to prevent pollution of soil and water. 12 refs.

**088826 ZWEIGETEILTE SCHALLSCHUTZWAND AUF DER GLEMTALBRUECKE DER DB-NEUBAUSTRECKE MANNHEIM-STUTTGART.** [Split Sound-Insulation Wall on the Glemstal Bridge of the New Mannheim-Stuttgart Rail Link of West German Railways.]. A 4.50 m high sound-insulation wall was erected on both sides of the Glemstal Bridge in order to reduce rail traffic noise on the new high-speed rail link. It was decided to split the structure into two sections - an exterior wall on the cornice and an interior wall on the service beam - for aesthetic reasons and for the benefit of the bridge investigation was specially developed for maintenance work on the bridges of the new rail link. The paper reports on the overall design, production and installation of the

exterior sound-insulation wall, as well as on structural measures for the interior sound-insulation wall. (Edited author abstract) In German. 1 ref.

**088828 PROCEEDINGS OF THE FOURTH INTERNATIONAL WORKSHOP ON RAILWAY AND TRACKED TRANSIT SYSTEM NOISE.** Proceedings incorporates 25 papers. Emphasis is on acoustic noise phenomena associated with railroads, streetcars, subways and similar transportation facilities. Methods of noise reduction and government regulations relating to noise pollution are considered. Topics covered include: elastomer rail support systems, railroad-induced vibrations in neighboring buildings, vibrations caused by streetcars and appropriate control measures, Japanese and Dutch railroad lines, noise prediction methods, sound propagation experiments, noise emission testing, community response to streetcar and railroad noise, interferometry applications, acoustic imaging, diesel engine exhaust noise, wheel/rail noise and roughness measurements, and noise generation due to rail/wheel contact. All papers are separately indexed and abstracted. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11060 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Anon. *J Sound Vib* v 120 n 2 Jan 1988, Proc of the Fourth Int Workshop on Railw and Tracked Transit Syst Noise, Noordwijkerhout, Neth, Oct 24-26 1985 p 203-429.

**088829 WHEEL/RAIL ROLLING NOISE: WHAT DO WE KNOW? WHAT DON'T WE KNOW? WHERE DO WE GO FROM HERE?** A review of the current state of knowledge of wheel/rail rolling noise is presented. Mechanisms for noise generation, sources of noise, predictive models and means for control are presented. Areas where additional research is required are suggested. It is pointed out that although considerable progress in expanding our understanding of wheel/rail rolling noise has occurred in the past ten years, there are still many areas of controversy and many areas where firmly based scientific information is lacking. (Edited author abstract) 31 refs.

**088830 NOISE GENERATION IN RAILWAY WHEELS DUE TO RAIL-WHEEL CONTACT FORCES.** In urban rapid transit systems the squealing noise of railway wheels during the passage through narrow curves is troublesome to passengers and city dwellers. Frequency analyses of measured curving-noise levels show that the bending vibrations of the wheel disks excited by stick-slip motion between the wheel rim and the rail are the main sources of this sound radiation. To get insight into the dynamics of the noise generation it is necessary to understand the bending vibration behavior of a wheel disk as well as the sound radiation mechanisms and the generation of self-sustained oscillations in the contact

area. The paper deals with a theoretical model which comprises all three parts of the problem. The natural bending vibrations of the wheel are calculated by means of a finite element-model. The forced and self-sustained oscillations are determined using modal expansion techniques. The radiated sound pressure and sound power due to wheel oscillations. Here, an acoustical quality level is introduced to classify the various types of wheel disks. The major assumptions in the paper are rigid rails and point contact between wheel and rail. **088831 WHEEL CORRUGATION ON NETHERLANDS RAILWAYS (NS): ORIGIN AND EFFECTS OF 'POLYGONIZATION' IN PARTICULAR.** New intercity trains on NS are quiet when new, but with time the growth of wheel tread corrugation gradually leads to increased noise levels. The phenomenon of 'polygonization' is discussed, including its origin and effects on noise emission. Attempts at combating this source of noise are reported. (Author abstract) 7 refs.

**088832 INTERFEROMETRIC ACOUSTIC IMAGING OF RAILWAY NOISE.** Far field acoustics deals with intensity distribution as a function of angle  $\alpha$  and frequency  $\nu$ . Interferometric processing is able to display the radiated intensity as a function of  $\nu$  and  $\alpha$  even for moving sources such as trains. A time constraint defines the duration of observation to avoid blur effects. With these techniques, acoustic imaging is able to describe the radiated noise by wheels with damped or undamped webs. The damping effect decreases the emitted level mainly in the 1 kHz and 2 kHz octave bands. (Author abstract) 9 refs.

Escudie, B. (ICPI, Lyon, Fr); Chiollaz, M.; Parent de Curzon, E. *J Sound Vib* v 120 n 2 Jan 1988, Proc of the Fourth Int Workshop on Railw and Tracked Transit Syst Noise, Noordwijkerhout, Neth, Oct 24-26 1985 p 303-310.

**088833 STUDY INTO SOURCES OF WAGON NOISE: MEASUREMENT OF SOUND ENERGY GENERATED BY VEHICLE BODIES AND RUNNING GEAR.** The paper describes measurements carried out to identify and quantify the sources of sound connected with the bodywork and running gear of railway wagons. Tests were conducted in France. Of the two methods adopted for test purposes, one was a conventional technique using a set of omnidirectional microphones placed vertically at vehicle gauge limit, and the other involved near-field interferometry based on the use of a flat acoustic antenna also placed at the edge of the track. The results of the measurements showed that for the 18 wagons of six different types studied, most of the sound energy radiated came from the running gear. (Edited author abstract) 1 ref.

**088834 COMMUNITY RESPONSE TO RAILWAY NOISE: A REVIEW OF SOCIAL SURVEYS.** Studies on the effects of railway noise on the neighbourhood differ in their design, acoustic and sociological measurement and in their evaluation methods. There are only a few studies with emphasis on the effects of shunting yards, high-speed trains and urban train systems, and therefore only the results concerning free-flow railway traffic are summarized. 30 refs.

Ger). *J Sound Vib* v 120 n 2 Jan 1988, Proc of the Fourth Int Workshop on Railw and Tracked Transit Syst Noise, Noordwijkerhout, Neth, Oct 24-26 1985 p 321-332.

**088835 IMPACT NOISE FROM RAILROADS.** Human response to impact noise, generated by wheel flats and rail joints of electric trains, was investigated in a laboratory experiment. The loudness of train noise containing impact components was compared with train noise with no impact components. A method of paired comparisons was used to evaluate the loudness of the test sounds. The results indicate that the wheel flat noise increases the loudness of train noise by 3 db and the rail joint noise increases it by 5 db (outdoor listening condition) and 7 dB (indoor listening condition) at the same equivalent sound energy level. **088840 CONSTRUCTION DE 137 km DE VOIE FERREE EN ALGERIE: LA LIAISON JIJEL RAMDANE-DJAMEL.** [Construction of 137 km of Railway in Algeria: the Jijel-Ramdane-Djamel Line]. Described is the railway line helping to open up the eastern end of Petite Kabylie and linking the port of Jijel to the future steel plant of El Milia. Civil engineering work is to be completed by mid-1988 and the line opened to traffic by the end of 1989. Running eastward, the line encounters successively a coastal dune zone, the narrow valley of Oued Zeggar. The adopted design speed is 120 km/h. The line includes 65 bridges, a prestressed concrete viaduct, eight tunnels, 23 million m<sup>3</sup> of earthworks, stations, housing and a ballast pit. The various phases of project completion are reviewed, with emphasis on the particularly interesting design of certain bridges. (Author abstract) In French.

**088841 HIGH-SPEED RAIL IN CALIFORNIA: THE DREAM, THE PROCESS, AND THE REALITY.** The 1983 high-speed rail proposal between Los Angeles and San Diego, California, was initiated by the American High Speed Rail Corporation (AHSRC), a private firm. The 130-mi, electrically powered 3.1 billion dollars system was to be based on the high-speed technology and design of the Japanese bullet train. The route was to be largely within or parallel to existing Interstate highway (I-5) and railroad right-of-way. The project proved to be very controversial, with the proponents eventually unable to obtain financing to continue. Opposition to the project centered mainly on environmental and economic impacts. Important considerations were noise, vibration, and visibility; beach access and lagoons; safety and property values; and transportation, namely, Amtrak service, local traffic and circulation, and local public transportation. The professional community seriously questioned AHSRC's ridership estimates and methodology. (Edited author abstract) 22 refs.

Research

**088842 BENEFITS ACHIEVED THROUGH RESEARCH IN HEAVY HAUL RAILROADS.** Mt. Newman Mining Co. and Hamersley Iron railroad research commenced in 1973 in response to specific technical problems which at that time threatened to increase significantly the railroad operating costs and to limit the potential for rapid expansion of production. The benefits obtained have extended beyond the solution of operating technical problems and the research is now being used to assist the achievement of railroad strategic objectives. Complex programs have evolved which would not have been possible without organizational commitment to an

ongoing research process. Emphasis is now placed on increased cost-effectiveness and the need for accurate research information has accelerated the establishment of computer data bases. (Edited author abstract) 26 refs.

## Stability

**088843 STABILITY OPTIMIZATION OF MULTI-AXLE RAILWAY VEHICLES POSSESSING PERFECT STEERING.** The general form of the equations of motion of multi-axle railway vehicles are used to establish the conditions which the elastic stiffness matrix (which describes the nature and configuration of the suspension elements connecting the wheelsets) must satisfy in order to achieve perfect steering on curves, an adequate margin of stability and optimal response to cant deficiency. These conditions are illustrated by application to the most general form of symmetric three-axle vehicle and it is shown that an adequate margin of stability can be obtained for an optimized set of parameters which allows perfect linear curving. The class of configurations studied allows for unequal wheelset conicities and inter-wheelset asymmetry within the assumption of overall vehicle symmetry. (Author abstract) 14 refs.

## Structural Analysis

**088844 SYSTEM AND STRUCTURAL ANALYSIS CONCERNING RAIL MOTOR VEHICLES.** A unitary methodology for the system and structural analysis is applied to the mechanisms that make up a rail motor vehicle. It points out the progressive-modular manner of considering a complex spatial system. Parallel constructive-functional analysis is used revealing significant design peculiarities. Elements of the graph theory are applied to the consideration of kinematic chains. Simple and complex kinematic chain mechanisms are characterized structurally. (Author abstract) 9 refs.

Ionescu, Theodor (Inst for Research & Technological Design in Transports, Bucharest, Rom). *Mech Mach Theory* v 22 n 5 1987 p 473-480.

**088845 CX [Dynamic Measurements in the Research and Development of Rail Vehicles].** This paper reviews the measurements which are necessary to all aspects of vehicle dynamics as applied to rail vehicles. Although an attempt has been made to introduce some reference to measurements made in Europe and America, the detailed discussion has been limited to those techniques employed by British Rail. This has the advantage that the discussion can be first hand and therefore more specific. For convenience the measurements have been collected together under four broad headings: 1. Measurements of rail system data, 2. Measurements of vehicle parameters, 3. Measurements to validate theory and predictions, and 4. Measurements of vehicle performance. (Author abstract) 36 refs.

**088846 MODERNISATION DU POSTE DE COMMANDEMENT (PC) DE LYON.** [Modernization of Lyons Traffic Control Center]. A large number of trains (TGV and conventional trains) are routed through the

Lyons railway complex everyday. The safety devices are operated from many signal boxes. Progressively these signal boxes have been provided with train monitoring equipment. To enable the Traffic Control Center to supervise and organize traffic through Lyons, all the train monitoring information is transmitted to the Control Center and shown on the visual display units of the different traffic controllers concerned. The sequence of trains passing through Lyons is recorded by actual graphs printed on paper by a tracing table. This article describes the new equipment provided for staff working at the Lyons Traffic Control Center. (Edited author abstract) In French.

**088847 DISPATCHING, 'STAR WARS' STYLE.** Union Pacific has awarded a contract to the Union Switch & Signal Division of American Standard for the consolidation of all dispatching operations in a CTC center at Omaha, Neb. Work on the project has already started, and UP will begin phasing in the new center late in 1988. When the consolidation is complete, dispatchers at the Omaha office will control all traffic on some 21,000 miles of line, including both CTC and dark territory. The Omaha facility will employ technology that Union Switch introduced on the UP at Portland, Ore., a little over a year ago. The Portland CTC office was equipped with the first color, video-projected railroad territory display. The new Omaha office also will feature a video-projected territory display, utilizing a rear-screen projection system.

**088848 REALISIERUNG VON SICHEREN BAHNSTEUERUNGSSYSTEMEN MIT MODERNSTER RECHNERTECHNIK.** [Railway Control Systems Based on Failsafe Microcomputers]. Railway control systems have to meet stringent safety and reliability requirements. The SEL solution is to apply parallel microcomputers and comparators for the results. Two examples in conjunction with the problems which arise are described. Particularly the advantages to be obtained from the use of high level languages and hardware components which are readily available are discussed. (Author abstract) 7 refs. In German.

Andexser, Werner (Standard Elektrik Lorenz AG, Stuttgart, West Ger); Steiner, Manfred. *Frequenz* v 42 n 2-3 Feb-Mar 1988 p 43-50.

**088849 UP MOVES TO CONSOLIDATE ALL DISPATCHING AT OMAHA.** Using an expanded and refined version of the video-projected territory display system pioneered at Portland, Ore., Union Pacific will consolidate nine train dispatching centers into one. The new Union Pacific dispatching center will be located in Omaha, Neb., the railroad's headquarters city. While the large-screen video-projected territory display is the focal point of attention in the Portland office, it's the center's highly sophisticated computer-aided dispatching system (CADS) that has had the greatest impact on expanding the capabilities of dispatchers. The consolidated Omaha dispatching center is being designed using much of the same technology that was implemented at Portland; however, the Omaha CADS will be approximately six times larger than the one in use at Portland. With the capability to control traffic on some 21,000 miles of trackage, the Omaha control center will foster the most powerful and comprehensive dispatching operation in the world.

**088850 CONSTRUCTION OF NEW GENERAL CONTROL SYSTEM IN TOKAIDO SHINKANSEN LINE.** More than twenty years have passed since the inauguration of the Tokaido Shinkansen line, which has grown into a major rail traffic artery in Japan. Following the recent construction of new stations on this line, the CTC system and the traffic control system (COMTRAC) at the General Control Center in Tokyo were extensively modified and improved. In the new control system, a

CRT-based train movement representation system has been introduced to promote efficiency and speed up dispatching work and also to save space in the General Control Center room. (Edited author abstract)

## Vibrations

**088851 WAVELENGTH OF HUNTING MOTION OF A SOFT TRUCK.** The wavelength of hunting motion is one of basic quantities expressing the hunting motion characteristics of a railway vehicle. Though formulae for a single wheel-set and a rigid truck are well known, they are not applicable to a soft truck, in which horizontal suspension stiffness between the axle box and truck frame is small. In this paper, an approximate expression for the wavelength of a soft truck is presented and verified with measured data. (Author abstract) In Japanese. 4 refs.

**088852 VIBRATIONS IN THE GROUND: RAILWAY INDUCED GROUND VIBRATIONS.** This paper describes the research program of committee D151 of the Office of Research and Experiments of the International Union of Railways. This committee has studied how the characteristics of vehicles, such as the roughness of the wheels, affects ground vibration and the manner in which the vibrations decay with distance. The committee has also studied the response of people to vibrations and possible damage to plastered masonry. The effect of special types of track construction in reducing vibration and the long-term performance of these systems has been examined for underground railways. Studies are still in progress to test antivibration measures placed alongside main line tracks in the open. (Edited author abstract)

## Wheels

**088853 HEAT HARDENING OF ROLLED RAILROAD WHEELS.** Wheel life improvement through better heat hardening processes has been considered. The standard requirements to wheels as specified by Soviet standards for the past two decades have been reviewed. An evaluation of wheel properties vs. quenching rate has been made. (Author abstract) 3 refs.

Miroshnichenko, N.G.; Staroseletskiy, M.I.; Shmakov, E.N.; Uzlov, V.I. *Sov Mater Sci Rev* v 1 n 1 1987 p 95-98.

**088854 DESIGN STRENGTH OF HEAT HARDENED ROLLED WHEELS.** Fatigue strength and its relation with brittle fracture resistance characteristics KCU and KIC have been considered. The stressed state of wheel disk has been analyzed for heat hardened wheels. The fatigue strength of wheel steel normalized to actual mean cycle stresses during cyclic loading of wheels in operation has been analyzed. It has been shown that compressive stresses in a real product can be regarded as a design strength margin. (Author abstract) 4 refs.

## Yugoslavia

**088855 YUGOSLAV RAILWAYS.** Developments on Yugoslav Railways (JZ) during 1986 and the first half of 1987 were affected significantly by unfavorable conditions in the country which constituted no less than a major

economic crisis. So there was a slow-down in the pace of modernization and in implementation of the national plan to make JZ the principal mode of long-distance transport. Notwithstanding the economic difficulties, in the 18 months to mid-1987 a number of important investment projects were completed, including the reconstruction of the line from the port of Koper through Divaca to Jesenice and the Austrian border, the opening of the line from the Albanian border to Titograd, the starting of construction of the 45 km line between Tuzla and Zvornik, completion of the electrification of the main trunk line from Jesenice to Gergelija, and electrification of the line from Bosanski Novi to Knin.

## Crack Propagation

**088857 MODELING OF EMBEDDED FATIGUE CRACKS IN RAILROAD RAILS.** A first-generation fatigue crack growth model has been developed which realistically models the patterns of subsurface shells and detail fracture crack growth that are commonly observed in railroad rails. (These types of defects are further described in the Introduction.) The key assumptions upon which the model is based are reviewed and the input data on railroad rail residual stresses and wheel-induced stresses are described. Examples of the predicted growth patterns for shells and detail fractures are shown and compared to actually observed growth patterns. Apparent deficiencies in the model are discussed and probable avenues for improvement in the accuracy of the crack growth life estimates are identified. (Author abstract). 14 Refs.

Rice, R.C. (Battelle Columbus Div, Columbus, OH, USA); Rungta, R. *Fatigue Fract Eng Mater Struct* v 11 n 3 1988 p 189-203.

**088858 STUDY OF SURFACE CRACK INITIATION DUE TO BIAxIAL COMPRESSION/SheAR LOADING.** This paper proposes a mechanism for surface crack initiation in rolling contact elements; it is based on the assumption that ductility exhaustion of the immediate surface layer taken place due to the incremental accumulation of surface plastic deformation. This deformation pattern is related to the nature of the combined compression-shear loading acting on the contact zone. An experimental technique employing a new design of biaxial specimen and loading apparatus has been developed and used to quantify empirically the features of the flow process leading to crack initiation. Results of the study are discussed in relation to failure characteristics of the railhead. (Author abstract). 18 Refs.

**Cutting** See RAILROAD PLANT AND STRUCTURES—Track.

**Defects** See CARS—Vibrations.

**Deformation** See Also STEEL—Mechanical Properties.

**088859 DEVELOPMENT OF TEXTURE IN DEFORMED LAYERS UNDER RUNNING SURFACE OF RAIL.** In order to clarify the mechanism of initiation of rolling contact fatigue cracking, so called shelling, on the running surface of rails in railway track, the characteristics of the deformed rail surface layer have been investigated by means of electron microscopes (SEM, TEM) and X-ray apparatus comparing the rolling-contacted test pieces and cold-rolled test pieces. A texture is formed as a result of the simple slip deformation of crystals in the deformed surface layer of rails used in track and the rolling contact fatigue-tested rails. This texture disappeared at the topmost surface because of the occurrence of some random plastic deformation. On the contrary, the texture of the cold-rolled test pieces results from the complex slip deformation of crystals and does not disappear at the surface. (Author abstract) In Japanese. 14 refs.

**Economics** See RAILROAD PLANT AND STRUCTURES—Track Ties.

**Fastening** See Also RAILROAD PLANT AND STRUCTURES—Track.

**088860 DIRECT FIXATION-THE CUSTOMIZED FASTENING.** The design of a direct fixation fastening system can be quite complex in comparison to the fasteners for conventional freight track. Moreover, there are reasons for this other than just securing the rail laterally, vertically, and longitudinally. Given the generally "fixed" nature of the transit structure supporting the rail, the direct fixation fastener must also compensate for the loss of some of the benefits offered by tie and ballast track construction. At the same time, the fastener may be required to perform additional specialized functions.

Anon. *Railw Track Struct* v 83 n 11 Nov 1987 p 34, 36.

**088861 HOW RESILIENT PADS PROTECT CONCRETE SLEEPERS.** One of the ways of avoiding damage to concrete sleepers by dynamic forces is to isolate the sleeper from the rail by using a resilient rail pad. However there has been some reluctance to adopt these pads because they allow greater movement of the rail relative to the sleeper which must increase the likelihood of wear or fatigue problems arising with fastening components. Pandrol International Ltd decided to tackle this problem by devising a method whereby the movement of the rail - in all directions - could be measured under passing traffic. They came up with the Dichroic Displacement Measuring System, which uses a non-contacting optical arrangement to measure rail movement to accuracies better than  $\pm 0.01$  mm at frequencies in excess of 2 kHz. Using this system, it was demonstrated that softer pads which achieve large reductions in sleeper strain will not increase the risk of clips or insulators failing prematurely.

Rhodes, David (Pandrol Int Ltd). *Railw Gaz Int* v 144 n 2 Feb 1988 p 85-87.

## Fatigue

**088862 FATIGUE ANALYSIS OF A RAIL SUBJECTED TO CONTROLLED SERVICE CONDITIONS.** A fatigue analysis was conducted on a rail that was placed in the Facility of Accelerated Service Testing (FAST) after a detail fracture was detected in service. The initial detail crack produced in service was grown to failure under controlled FAST conditions simulating service. Knowledge of the FAST wheel/rail load history for this rail made it an ideal candidate for quantitative

fatigue crack growth analysis. The investigation revealed that undulations in the detail fracture surface were caused by changes in the direction of traffic. The angle of the fracture surface, with respect to the running surface of the rail, was measured for each direction change. These results showed that the angles did not change significantly as the depth of the crack increased, relative to the running surface. (Edited author abstract) 5 refs.

Rice, R.C. (Battelle Columbus Div, Columbia, OH, USA); Rungta, R. *Fatigue Fract Eng Mater Struct* v 10 n 3 1987 p 213-222.

**088863 EVALUATION OF THE FATIGUE CRACK GROWTH AND FRACTURE TOUGHNESS CHARACTERISTICS OF RAIL STEELS.** The fatigue crack growth and fracture toughness characteristics of six rail steels have been evaluated. The overall test program included tensile testing, the determination of the longitudinal residual stresses, fatigue crack growth tests, and static and dynamic fracture toughness determinations. In addition fatigue crack growth was studied in rail heads with the effects of residual stress taken into account. The six rails differed in processing histories as well as composition and consisted of a standard carbon rail, a fully heat-treated rail, two Cr-Mo rails, a Cr-V rail, and a head-hardened rail. With the exception of the head-hardened rail, residual tensile stresses were present in the head and base of all other rails. (Edited author abstract) 14 refs.

**Fracture** See Also STEEL—Fracture.

**088864 EFFECT OF SERVICE LOADING ON SHELL GROWTH IN RAILS.** A study is made of the relatively benign shelling fractures observed in the railhead. In particular, the tendency of these horizontal fractures to turn into a vertical detail fracture during fatigue crack propagation is considered. A two-dimensional linear elastic fracture mechanics model is combined with a proposed fatigue crack path stability model to study the effects of the complex stress state in the rail on this crack turning process. The results indicate that the leading edge of the shell will tend to turn down into the rail while the trailing edge will propagate to the surface for a short shell. However, once the shell reaches some calculated length, both ends will tend to grow to the surface. The most significant finding is that if the shell grows through the length of instability, it will grow in a stable in-plane manner. Finally, the analysis is compared to field observations. (Author abstract) 35 refs.

## Heating

**088867 HEATING OF POINTS UNDER CONDITIONS OF HEAVY SNOW FALL: THE SBB.** The article briefly describes the equipment used and measures taken to maintain normal winter services in Swiss railways (SBB). Particular guidelines have been established for operating basic services under extreme weather conditions. If particularly heavy snow falls occur, the optional use of points is reduced to the absolutely essential, especially when there are not enough staff available for snow clearance. As part of normal investment, and where necessary, points will be heated on the heel points on long stretches of track. Gas heating systems will also be equipped with electric distance lighting and remaining strategic points equipped with heating. In areas where there are regular heavy snow falls, signals will be equipped with lense heating systems and points with weather-proof interlock caps.

**Inspection** See RAILROAD PLANT AND STRUCTURES—Track Inspection.

**Joints** See RAILROAD PLANT AND STRUCTURES—Track.

## Laying

**088868 TEMPERATURE AND RAIL LAYING.** Recent research indicates that the rail laying temperature is not constant with time. It appears to vary as a function of traffic and maintenance activity, and has an overall tendency to decrease. This results in rail neutral temperature that is below the rail laying temperature. Correspondingly, there is a greater potential for high longitudinal compressive forces to build up in the rail. The results of the mentioned research are illustrated. These results strongly suggest that simply setting a rail laying temperature, particularly a high temperature, is not sufficient in itself to guarantee the elimination of track buckling. Rather, a comprehensive effort based on an understanding of the phenomenon and its mechanisms is needed to properly establish and implement an effective track maintenance and buckling prevention program. 3 refs.

Zarembski, Allan M. (ZETA-TECH Assoc). *Railw Track Struct* v 84 n 3 Mar 1988 p 12, 14.

## Lubrication

**088869 WHEEL/RAIL LUBRICATION:** The results of laboratory research and field tests to advance lubrication technology were covered in the Symposium on Wheel/Rail Lubrication. Presentations ranged from tests on lubricants to detailed studies of fuel savings and the numerous lubricating systems now available. These include: locomotive mounted lubricators; wayside electronic lubricators; oil lubrication; predicting wheel/rail wear tests; locomotive-mounted wheel flange systems.

Anon. *Railw Track Struct* v 83 n 10 Oct 1987 p 34-35.

**088870 OIL LUBRICATION - AN EFFECTIVE ALTERNATIVE.** With lubrication, friction forces are cut to less than one-third of those between dry rail and wheel flanges. Wheel scream, a serious problem for some rapid transit routes, is virtually eliminated. Wheel life can be extended by a factor between three and ten. The mechanism that supplies these benefits is more complex than mere separation of wheel and rail with a film of oil. In fact, straight mineral oil will not survive the loads. To survive such loads, the oil must contain chemical additives which will react with the rail and wheel to form a boundary film.

It is this chemical film, not the oil itself, which provides friction reducing anti-wear benefits. 2 refs.

Pugh, James R. (Lubriquip-Houdaille Inc, Cleveland, OH, USA). *Railw Track Struct* v 84 n 4 Apr 1988 p 32-33.

**088871 RAIL LUBRICATION: THE SEARCH FOR SOLUTIONS.** There's no longer any doubt about the substantial bottom-line benefits of universal rail lubrication. Now, railroads are looking for the lubricant that will do the job best - and safest. An official of the Transportation Test Center believes that research efforts should be aimed at developing and testing lubricants that can stand up to what might be called ultra-high-extreme pressures, not just the stresses that can be met by what the producers now regard as extreme-pressure additive lubricants. Some of this kind of work is happening. For example, Oregon Technical Laboratory is regarded as being in the lead in lab test techniques. Lubrizol is regarded as being in the lead in working with materials that will withstand the 100,000-psi stresses. Meanwhile, the Transportation Test Center will be looking at a number of factors regarding lubrication, testing and optimums as part of the program budget for 1989.

**Materials** See STEELMAKING—Physical Chemistry.

## Measurements

**088878 USING RAIL INFORMATION.** Track measurement technology has advanced to the point where it is now possible to obtain reliable information about the condition of the head of rail. This data can be derived for a large stretch of track, or even an entire railroad. Such modern systems now include the capability of measuring both the transverse and longitudinal profiles of the rail by means of high-speed inspection vehicles. Also, the methods involved in the use of this technology furnish an extremely large volume of measurement data. This must be analyzed and converted into usable information. 1 ref.

Zarembski, Allan M. (ZETA-TECH Assoc). *Railw Track Struct* v 84 n 1 Jan 1988 p 12.

**088879 MEASUREMENT OF TRACK ALIGNMENT AND CURVATURE.** Several systems of measurement have been used earlier but what is needed is a measuring system able to produce two separated data channels - longwave curvature and shortwave wave alignment profile. A method of measurement able to make this distinction was first derived by British Rail as part of the design of their High-Speed Track-Recording Car (HSTRC) and has been in use ever since as part of the BR standard system. The HSTRC was designed for high-speed operation and has made successful measure-

ments at speeds of 220 km/h, although it is now normally operated at speeds below 180 km/h. The methods used are described. 11 refs.

**Noise, Acoustic** See Also CARS—Street Railroad; WHEELS—Vibrations.

**088880 WHEEL/RAIL NOISE GENERATED BY A HIGH-SPEED TRAIN INVESTIGATED WITH A LINE ARRAY OF MICROPHONES.** Radiated noise generated by a high-speed electric train traveling at speeds up to 250 km/h has been measured with a linear array of microphones mounted along the wayside in two different orientations. The test train comprised at 103 electric locomotive, four Intercity coaches, and a dynamo coach. Some of the wheels were fitted with experimental wheel-noise absorbers. By using the directional capabilities of the array, the locations of the dominant sources of wheel/rail radiated noise were identified on the wheels. For conventional wheels, these sources lie near or on the rim at an average height of about 0.2 m above the railhead. The effect of wheel-noise absorbers and freshly turned treads on radiated noise were also investigated. (Author abstract) 10 refs.

Barsikow, B. (DFVLR, Berlin, West Ger); King, W.F. III; Pfizenmaier, E. *J Sound Vib* v 118 n 1 Oct 8 1987 p 99-122.

**088881 EXPERIMENTAL ANALYSIS OF WHEEL/RAIL NOISE BY NEAR FIELD ACOUSTICAL IMAGING.** A near field acoustical imaging method applied to the localization and analysis of rolling noise sources on a wheel of a railway tracked vehicle is presented. This method consists in using an acoustical plane microphone array (mounted on the vehicle), which may be moved depending on the wheel/rail part being investigated. A space-frequency processing of the acoustical signals given by the array makes it possible to evaluate the acoustical energy radiated by the area considered, in a given octave band. (Edited author abstract) 4 refs.

Wetta, P. (MetraVib RDS, Ecully, Fr); Beguet, B.; Parent de Curzon, E. *J Sound Vib* v 120 n 2 Jan 1988, Proc of the Fourth Int Workshop on Railw and Tracked Transit Syst Noise, Noordwijkerhout, Neth, Oct 24-26 1985 p 255-265.

**088882 DUTCH RAILWAY NOISE PREDICTION SCHEMES.** A calculation scheme for the prediction of noise levels along railway lines was completed in 1984 and has been applied since then in the framework of the Dutch Noise Pollution Act. The scheme makes it possible to calculate the equivalent sound levels  $L_{Aeq}$  at receiver positions up to distances of 1500 m and can be used in almost every situation except large railway yards and large stations. A simplified calculation method working in dB(A) was derived for situations without any screening by obstacles such as barriers. The source model is based on investigations of wheel/rail noise. The source strength and the factors that influence the emission were derived from measurements. The propagation of railway noise over large distances can be predicted by the propagation model that has been used for road traffic noise and industrial noise. The models differ only for the propagation in the region near the source. (Author abstract) 4 refs.

van Ruiten, C.J.M. (TNO, Delft, Neth). *J Sound Vib* v 120 n 2 Jan 1988, Proc of the Fourth Int Workshop on Railw and Tracked Transit Syst Noise, Noordwijkerhout, Neth, Oct 24-26 1985 p 371-379.

**088883 ELASTOMER RAIL SUPPORT SYSTEMS: PROBLEMS IN DYNAMIC TESTING.** Methods of dynamic testing in use for elastomer rail support systems are described and compared with respect to the significance of the results for the prediction of the behaviour of the installed system in reality. The discussion leads to proposals for test procedures matching the demands of the design engineer charged with the selection of a special product. (Author abstract) 10 refs.

**088884 CHANGING THE GAUGES OF A WHOLE RAILWAY NETWORK. THE SITUATION IN SPAIN.** This report outlines the major drawbacks and marginal benefits, for Spain, of operating a rail network built to a different track gauge than that used elsewhere in Europe. The report develops arguments for solving this problem through an integrated plan providing for track modernization and renewal of the locomotive and rolling stock fleet. As part of this plan, the whole network would be upgraded over some 40 years, with provisional axle and bogie changeover facilities which would never remain in the same place for more than 5 years at a time. The standard-gauge solution (1435 mm) would be adopted as from Irun frontier on selected lines of route depending on track condition and other circumstances. It is evaluated that this track changeover program for the Miranda-Irun, Palencia-Santander and Madrid Palazuelo lines of route will cost an extra 5 million pesetas on average per kilometer. (Edited author abstract).

**Steel** See STEEL—Mechanical Properties; STEEL HEAT TREATMENT—Stresses.

## Stresses

**088885 MEASUREMENT OF RESIDUAL SHEAR STRESSES NEAR THE SURFACE OF A RAIL HEAD.** This report describes an experiment designed to measure residual shear stresses near the surface of a rail head. It is shown that the shear stresses in the rail are very small, despite the predictions of the theory. The measurements taken in this experiment also enable the longitudinal, vertical and lateral residual stresses in the rail to be estimated. These results are compared with previous experimental measurements and with theoretical predictions.

**088886 RAIL DEFECT TYPE VS. DERAILMENT RISK.** That the likelihood of a derailment and its associated cost have a significant effect on rail replacement strategies should come as no surprise to anyone. As the cost of derailment increases, the rail must be removed from track at an earlier point in its life. Earlier investigations into the probability of rail-caused derailments, revealed that the occurrence rate for such incidents is approximately one per 100 to 200 service breaks. The types of rail defects were divided into the following two classifications based on the stress-causing mechanism: flexure stress-dependent failures; contact/residual stress-dependent failures. 3 Refs.

## Structural Analysis

**088887 ON THE VERTICAL MODULUS IN THE STANDARD RAILWAY TRACK ANALYSIS.** The evolution of analyses for longitudinal and cross-tie tracks, and of the closely connected concept of the track modulus, is reviewed. It is then shown that some of the notions introduced during the past century and used to this date, in connection with its definition and determination, have no physical bases and are incorrect. The proper definition

of the track modulus is discussed. This is followed by a review of the various field methods for its determination and the presentation of a simple method which uses any car or locomotive available. (Author abstract)

Kerr, A.D. (Univ of Delaware, Newark, DE, USA). *Rail Int* v 18 n 11 Nov 1987 p 37-45.

**088888 LATERAL STABILITY OF TRACK.** To calculate rail's buckling forces it will be necessary to know the geometrical properties of rails and track lateral resistance. This one, which is a function of weight, spacings and dimensions of cross-ties; of profile and dimensions of embankment and of ballast's compactness, may be determined by means of in situ tests. For the Brazilian rail TR-68 (68 kg per meter) the buckling loads will be comprised of between 700 and 1200 kN, depending on the lateral resistance of the track. Equations are given that allow: the evaluation of the rail's buckling forces; and the calculation of the critical variation of temperature. 3 refs. (Inst de Pesquisas Technologicas, Sao Paulo, Braz). *Rail Int* v 19 n 4 Apr 1988 p 43-45.

**Testing** See Also RAILROAD PLANT AND STRUCTURES—Track Switches; STEEL—Deformation.

**088889 PUEBLO PREPS FOR HAL TEST.** HAL, the Heavy Axle Loading test program which will get under way early in 1988 at the Transportation Test Center at Pueblo. HAL will be working with 315,000 pounds, weight on rail. In full-scale train operation, TTC is planning to put 100 million to 200 million gross tons on track in the High Tonnage Loop of the Facility for Accelerated Service Testing. When HAL testing is completed, railroads should have a far better idea of what heavy loading does to track than they have ever had before. And there will be a substantial data base from tests of 100-ton loadings for comparison purposes.

Welty, Gus (Railway Age, New York, NY, USA). *Railw Age* v 188 n 9 Sep 1987 p 83, 85.

**088890 INVESTIGATION ON A LOW-ALLOY STEEL RAIL OF TENSILE STRENGTH 1078N/MM<sup>2</sup>.** The necessity and the basis of compositional design of a low alloy rail steel of TS 1078N/mm<sup>2</sup>, as well as its experimental manufacture results, are described in this paper. The experimental results indicated that the abrasion-resistant rail steel SiMnV of a special class possesses high strength and good toughness, and it is suitable for the production conditions of Anshan Iron and Steel Co., and suitable in terms of the utilization of natural resources in China. The test carried out in the railway proved that its service life is over three times that of medium manganese rail steel. (Edited author abstract) In Chinese. 4 refs.

**088891 COMPARISON OF THE WEAR PROCESS FOR EUTECTOID RAIL STEELS: FIELD AND LABORATORY TESTS.** There is a need for a reliable laboratory test with which to determine the influence of metallurgical properties on the wear resistance of railroad rails. It is now well established that, in order to be relevant, such a test must reproduce the essential features of the wear process occurring in the field. In this investigation, a detailed examination of the gauge face of a rail used in unlubricated curved track under well-documented conditions has been carried out using a combination of optical and scanning electron microscopy. The results are compared with those from a similar study of the wear surfaces of rail steel specimens tested in both a pin-on-disk and a twindisk rolling contact wear testing

device. It is shown that, provided the test conditions are chosen carefully, an adequate simulation can be produced. (Author abstract) 12 refs.

Danks, D. (Oregon Graduate Cent, Beaverton, OR, USA); Clayton, P. *Wear* v 120 n 2 Dec 1 1987 p 233-250.

**088892 TEST AND FATIGUE OF THE RAIL.** The rail as the most significant element of the railway track has been developed even in recent decades both in relation with its mechanical and chemical parameters. The steels of rail are to be classified in the brittle or in the transition zone of fracture. This circumstance ought to be changed in order to be able to reduce the rail failures and weld ruptures in winter time. The fatigue cracks in the rail, their propagation and the classification of these cracks under the safety limit is of importance from the point of view of a safety railway operation. The author investigates the occurrence of such deficiencies under the safety limit as well as the time-dependent propagation of them and gives answers to the questions relating to the classification and development of the kidney-formed cracks caused by the fatigue of the rail steel. (Edited author abstract)

**088893 COST CUTTING FOR QUIETER TRACK.** The 'Cologne Egg' is a rail fastening system which is a ballastless spring system in track without a 'mass'. Developmental work continues on the new fastening system, and has resulted in the design of 'Turnout Eggs'. The Cologne Egg can be employed with great advantage on wooden ties without ballast support, such as on bridges. It can also be used in more conventional aerial and tunnel track having highly compacted ballast. Still, track spring mats are an excellent means of noise and vibration insulation in new tunnels or on bridge and aerial structures.

**088894 ANALYSIS OF ROLLING CONTACT WITH KINEMATIC HARDENING FOR RAIL STEEL PROPERTIES.** This study presents calculations of two-dimensional rolling contact deformation for rail steel properties. Finite element analyses, previously carried out for perfect plasticity, are extended to the kinematic hardening behavior of rail steel. A three-parameter elastic-linear-kinematic-hardening-plastic description of the cyclic stress-strain behavior of rail steel is inserted in the finite element model. Steady-state results are obtained after two translations. The effects of the kinematic hardening at three relative peak pressures  $p_0/k_k = 4.0, 4.5$  and  $5.0$  are examined. The calculations evaluated the rim distortion, the cyclic plastic strains and the residual stresses, the shakedown limit for kinematic hardening and the effects of strain-amplitude-dependent kinematic properties. The calculations reveal that the kinematic hardening of rail steel produces substantial alterations relative to the deformation and residual stresses associated with perfect plasticity. Cyclic strains are an order of comparable relative contact pressures. (Edited author abstract) 18 refs.

**088895 RIFFELBILDUNG AUF EISENBAHN-SCHIENEN - WECHSELSPIEL ZWISCHEN KURZZEITDYNAMIK UND LANGZEIT-VER-SCHLEISSVERHALTEN.** [Rail Corrugation - Interaction Between Transient Dynamic Effects and Long-Term Wear Behavior]. The mechanism leading to the initiation of corrugations on apparently smooth rails is explained as

a feedback process between the wheel and rail oscillations (transient dynamic effects) and wear phenomena (long-term behavior). Using a completely linear short-term dynamic model, the wheelset is described in the frequency range up to 2000 Hz in terms of its natural modes. The high-frequency processes in the contact area as well as the behavior of the discretely sleeper-supported track are interpreted in terms of frequency responses. Small periodic irregularities of the rail profile result in periodically varying contact forces and, as revealed by a linear long-term wear model, in periodic rail wear. The profile disturbances stimulating the oscillations are thus either magnified or reduced. In the course of time, the wavelengths experiencing a particular magnification in the feedback process involving transient effects and wear are 'filtered out'. The completely linear model provides a first insight into the corrugation mechanism by identifying those structural vibrations and parameter combinations which are particularly susceptible to wear. **Welding** See Also RAILROAD PLANT AND STRUCTURES—Maintenance of Way.

**088898 STUDY OF THE CRACK RESISTANCE OF RAIL STEEL WITH A WELD SEAM.** An analysis shows that the main cause of the failure of welded rails is the development of fatigue cracks in the weld zone from manufacturing defects. A method of accelerated high-frequency cyclic loading of samples with weld seams has been developed which makes it possible to determine the crack resistance of rail steel produced by various methods. An optical caustic method for determining the crack resistance of model samples with a weld seam and defects near it has been tested. In Russian. 6 refs.

**088899 APPLICATION OF LONG RAILS IN JA-**

**PAN.** The laying of long welded rails to eliminate joints in rails, which are the greatest defect of railway tracks, is now widely practiced throughout the world. In this article, studies aimed at solving the problems in realizing long-rail tracks, formulating an applicable theory, confirming safety, etc., performed in Japan are cited. Then the article discusses the conditions for track alignment, applicable methods of welding, the relation to ambient temperature and the transporting of long rails. In addition it describes supervisory technique and maintenance methods for long rails after they are laid down. (Edited author abstract) 4 refs.

**088900 ULTRA LIGHT WELDING CLAMP FOR HIGH QUALITY WELD GEOMETRY.** For the positioning of rail ends prior to thermit welding many methods have been applied, varying from wooden blocks plus wedges to all kinds of welding frames. In general these frames have the disadvantage of being heavy, unable to control the degrees of freedom per rail end independently and they don't allow for measurement of the adjusting parameters in a simple way. In response to this problem, Netherlands Railways has developed a new ultralight-weight welding, clamp (about 15 kg) which, when used in combination with an electronic straight edge, ensures a substantially better thermit weld geometry. 3 refs.

**088901 THERMIT - WELDING OF RAILS: OLD RECIPE FOR MODERN TRACK.** Thermit-welding has the capability of autonomously producing a certain quantity of steel with clearly-defined characteristics, without needing recourse to external energy sources; in other words without help from fixed and heavy equipment. This technique, through reliance on non-cumbersome appliances, is ideal for rail welding on busy tracks which cannot afford lengthy out-of-service periods. The fact that the consistency of the weld portions is well blended means that differently-alloyed elements - carbon steel on manganese steel - can amalgamate without problem, resulting in elimination of all track points. Thermit-welding is an extremely reliable process.

**088902 USE OF RADAR TO DERIVE A STORM INTENSITY-DURATION CURVE.** One solution for obtaining a large amount of closely spaced in intensity-duration values is to use weather radar. Using weather radar data, intensity-duration curves could be produced routinely for any set of prespecified locations. The radar data thus have the potential for facilitating the identification of the return period of rainfall events quickly, cheaply, and precisely when the long-term intensity-duration curves are available. As a pilot project to demonstrate the feasibility of the method and the potential of the radar data, computer software was developed to derive from archived radar data, intensity-duration-values for up to a 2,500 km<sup>2</sup> area for a given storm. **088903 MORE ABOUT RAINFALL RATES AND THEIR PREDICTION FOR RADIO SYSTEMS ENGINEERING.** Owing to the interest raised by the effect of precipitation on the design of satellite or terrestrial radiocommunication systems at high frequencies, it is important to have a mathematical or semiempirical model which correctly accounts for rainfall rate cumulative distributions whatever the climatic region. An empirical model is suggested, based on two parameters: the rain rate value  $R_{0.01}$  (mm/h) in the considered location, and a parameter which depends on the geographical characteristics of this location. This model allows the calculation of instantaneous rain rate cumulative distributions, depending on the use of CCIR hydrometeorological zones, or CCIR contours of rainfall intensities exceeded for 0.01% of the time:  $R_{0.01}$  (mm/h). (Edited author abstract) 24 refs.

**088905 ANALYSIS OF THE DESIGN STORM TIME-INTENSITY PATTERN FOR MEDIUM AND SMALL WATERSHEDS.** The present method for the computation of the design storm is based on point precipitation and only the recurrence frequency of annual maximum values for durations is considered. In order to analyze the method commonly used in practice for the derivation of the design storm pattern, three hydrological stations with different control areas were selected. Based on the areal average rainfall and an analysis of the correlation between storms and floods, a reasonable method for determining the design storm pattern can be obtained. As a result of this analysis, it is reasonable to synthesize and select the design storm pattern for medium and small watersheds from the areal storm pattern corresponding to the observed major floods for watersheds of similar size, and then to derive the storm pattern by controlling the subsegments which have the same frequency. (Edited author abstract) 5 refs.

Qian Wang Cheng (Hydrological General Station of Guangdong Province, Canton, China). *J Hydrol* v 96 n 1-4 Dec 15 1987 p 305-317.

**088906 FACTORS AFFECTING DEVELOPMENT OF HUFF CURVES.** The effects of three factors that affect storm identification on F.A. Huff curves were investigated. The effect of sampling interval on Huff curves is minor, allowing the use of more readily available hourly precipitation data by practicing engineers. The method of identifying individual storms using the critical duration of dry periods between rainfall periods also has a minor effect, in spite of large differences between critical duration estimates, making Huff curves relatively insensitive to estimates of critical duration. There is a significant effect of season of year on Huff curves. Huff curves have potential for more widespread practical use as design

storms. (Edited author abstract) 9 refs.

Bonta, J.V. (USDA-ARS, Coshocton, OH, USA); Rao, A.R. *Trans ASAE* v 30 n 6 Nov-Dec 1987 p 1689-1693.

**088907 PRECIPITATION CHARACTERISTICS FROM VARIABLE, HOURLY AND DAILY DATA BASES.** A continuous 35-year detailed time-depth record of precipitation in central Missouri was used to develop variable, hourly and daily time bases of the same precipitation sequence. The three time bases were searched in turn for precipitation event periods according to a two parameter event definition. Events were identified by a minimum depth and a minimum time without precipitation between events. Summary statistics showed high coefficients of variation and coefficients of skew for most event characteristics. The event characteristics of duration, interlude, depth and kinetic energy were similar for the variable and hourly time base data. The duration and depth characteristics were essentially identical. Thus, the hourly time base data may be adequate for certain design or simulation applications where these characteristics are important. Additional study results are discussed. (Edited author abstract) 8 refs.

**088908 COMPARISON OF FOUR DESIGN-STORM HETEROGRAPHS.** Dimensionless mass curves for four types of design storms representing different degrees of flexibility in rainfall and intensity pattern were investigated: F.A. Huff curves, a simple triangular shape, a complex trapezoid-rectangular shape, and a complex triangular shape. Little variation was found in dimensionless mass curves when the duration of the maximum intensity burst of rainfall was varied over two orders of magnitude for S- and D-type patterns. Little variation was found in dimensionless mass curves when time-to-peak was varied from one storm quartile to the next for Y-, S-, and D-type patterns. Huff curves were the most flexible of the four patterns investigated. (Edited author abstract) 7 refs.

Bonta, J.V. (USDA, Coshocton, OH, USA); Rao, A.R. *Trans ASAE* v 31 n 1 Jan-Feb 1988 p 102-106.

**088909 EXTREME RAINFALL FOR AFRICA AND OTHER DEVELOPING AREAS.** Methods are presented for estimating rainfall intensities with a minimum of data. Equations are given for use with 20-yr return period monthly rainfall amounts and with daily rainfall extremes. Depth-duration and depth-frequency ratios of extreme rainfall amounts have been found to be remarkably uniform within large and diverse geographical areas. This appears to be true for all of Africa. Large expenditures are being made to improve the collection of hydrologic and meteorologic data in the Sahel of Africa. Known ratios and relationships presented herein can improve the use of the existing long records and of data currently being collected. Greater emphasis on training in the use of the climatic data base is now available, and the need to be improved is recommended. (Edited author abstract) 13 refs.

**088910 CORRELATION PROPERTIES OF RAINFALL RATES IN THE UNITED KINGDOM.** Rainfall-rate data acquired from the UK Meteorological Office are analyzed to obtain spatial correlation properties of rainfall rates at 23 locations in the UK. Correlation coefficients of the rainfall rates between two locations are derived, and dependences of separation distance, season, and integration time on the coefficients are clarified. Conditional correlation coefficients, obtained from rainfall-rate data only larger than 1 mm/h at both locations simultaneously, are obtained and related to the nonconditional coefficients. Joint probability distributions of rainfall rates at two locations are approximated by a bivariate log-normal distribution function, in which a modified correlation coefficient is used. (Edited author abstract) 10 refs.

Fukuchi, H. (Univ of Bradford, Bradford, Engl.) *IEE Proc Part H* v 135 n 2 Apr 1988 p 83-88.

**088911 SPATIAL DISTRIBUTION OF PRE-WARM FRONT RAINFALL IN THE MEDITERRANEAN AREA.** Evidence is given of the distribution of pre-warm front rainfall at the meso- $\gamma$  scale, together with a discussion of the main mechanisms producing this variability. An inland region in the Mediterranean area is considered. The selected rainfall type is commonly considered the most regular inasmuch as it is usually unaffected by extended convective motions. Despite this, within a storm a large variability in space was observed. For 90% of measurements, the typical deviations from the area-average total depth ranged from -40 to 60% and the storm ensemble-average rainfall rate over a hilly zone was 60% greater than that in a contiguous low-land zone generally placed upwind. This variability is largely explained in terms of forced uplift of air mass over an envelope type orography. Additional aspects of the subject are discussed. (Edited author abstract) 16 refs.

Corradini, C. (Natl Research Council, Perugia, Italy); Melone, F. *Nord Hydrol* v 19 n 1 1988 p 53-64.

**088912 ANALYSIS OF RAINFALL SERIES IN THE DESIGN OF URBAN DRAINAGE CONTROL SYSTEMS.** Intensity-duration-frequency curves are traditionally used in the design of urban runoff treatment and management systems. The uniform intensity for a specified duration and return period is selected for a design storm without consideration of the inter-event dry periods between two successive rainfall events. For many purposes, especially those related to urban storm pollution control and receiving water impacts, the cumulative effects of successive storm events must be taken into account. This fact requires the selection of design storms where the minimum inter-event dry periods are adjusted to the effect in question. This paper discusses the concept of inter-event dry periods for evaluation of design storms derived from a rainfall record. As an example the rainfall record for the city of Odense, Denmark, has been analyzed. The basic statistics as well as the importance of the concept will be illustrated. (Author abstract) 18 refs.

Hvitved-Jacobsen, Thorkild (Univ of Aalborg, Aalborg, Den); Yousef, A. *Water Res* v 22 n 4 Apr 1988 p 491-496.

**088913 ESTIMATION OF CATCHMENT RAINFALL UNCERTAINTY AND ITS INFLUENCE ON RUNOFF PREDICTION.** Interpolation of spatially varying point precipitation depths introduces uncertainties in the estimated mean areal precipitation (MAP). This paper describes a geostatistical approach - the Kriging method - to calculate the daily MAP on real-time basis. The procedure provides a linear unbiased estimate with minimum estimation variance. The structural analysis of the random precipitation field is automatized by relating the time-varying semivariogram model to the sample variance. This is illustrated on data from a Danish IHD catchment. The conceptual rainfall-runoff model NAM incorporated into a Kalman-filter algorithm is applied to investigate the effects of uncertainties in MAP on the runoff predictions. Measurement and processing errors are not included in the investigation. (Author abstract) 18 Refs.

**088914 SPATIAL AND TEMPORAL SCALES IN RAINFALL ANALYSIS-SOME ASPECTS AND FUTURE PERSPECTIVES.** Aspects of spatial and temporal rainfall variability and rainfall analysis in relation to some water management problems are surveyed and discussed. It is concluded that relevant modelling of hydrological processes in which the rainfall is a driving force is vital with respect to possibilities of finding solutions to increasing environmental problems following urbanization and industrialization. However, modern

computer methods and our knowledge of the spatial and dynamic properties of rainfall fields are seldom used in practical engineering applications. This causes errors and uncertainties in the calculated output. Bridging the gaps between researchers and engineers may overcome some of these problems. It is also argued that experimental studies in a variety of climates and physiographical conditions using an interdisciplinary approach are needed in order to further investigate the scale and dynamics of spatial rainfall variability. (Author abstract). 125 Refs.

**088915 FITTING EQUATIONS TO FAMILIES OF DIMENSIONLESS CUMULATIVE HYETOGRAPHS.** The simultaneous fitting of a family of curves using linear programming LP is illustrated by fitting equations to families of design storms known as Huff curves. Tenth degree polynomials are fitted to 12 9-curve families. The results showed that the LP method generally works well, but that it is possible that constraints may not be satisfied in intervals between data points used in the formulation of the problem, and that numerical problems may result if a high degree polynomial is used. The effects of these numerical problems are dependent on the particular data set being used, but the errors in the design-storm illustration were not important for the flood-estimation objective for which they were developed. (Edited author abstract). 13 Refs.

## Arizona

**088916 RAINFALL INTENSITIES FOR SOUTH-EASTERN ARIZONA.** Small watershed storm runoff in the southwestern United States is dominated by intense, short-duration convective rains of limited areal extent. Storm drainage design is often based on rainfall information published by the National Weather Service in the National Oceanic and Atmospheric Administration (NOAA) Atlas 2 series. In NOAA Atlas 2, short-duration rainfall is derived by an extrapolation procedure from maps of 6-hr and 24-hr rainfall amounts with different frequencies. In this study, intensity-duration-frequency values for 1 hr and less, based on data from a dense network of rain gauges in southeastern Arizona, are compared to similar values derived from NOAA Atlas 2. Differences in rainfall intensities obtained from the two methods are illustrated by simulating and comparing peaks and volumes of runoff. Refs.

**Australia** See AIR POLLUTION—Acid Rain; GEOTHERMAL WELLS—Australia.

## Bermuda

**088917 OCCURRENCE AND DISTRIBUTION OF TRACE ORGANIC COMPOUNDS IN BERMUDA PRECIPITATION.** Data are presented on the chemical composition of 36 rainwater events sampled in Bermuda during 1983 and 1984. Samples were analyzed for alpha and gamma isomers of hexachlorocyclohexane, chlordane and dieldrin. Mean concentrations with standard errors found were  $854 \pm 217 \text{ pg l}^{-1}$  for  $\alpha$  HCH,  $126 \pm 27 \text{ pg l}^{-1}$  for  $\gamma$  HCH,  $77 \pm 17 \text{ pg l}^{-1}$  for chlordane and  $158 \pm 27 \text{ pg l}^{-1}$  for dieldrin. The data indicate that higher concentrations of  $\alpha$  HCH and  $\gamma$  HCH in rainwater are associated with air masses originating in North America. The concentrations of the compounds in precipitation are highly variable and the deposition of the compounds is extremely episodic. The wet fluxes of chlordane and dieldrin are discussed in relation to deep-sea sediment trap measurements collected at 3200 m in the Sargasso Sea 25 km southeast of the rainwater sampling site and indicate a wet flux of  $78\text{--}115 \text{ ng m}^{-2} \text{ yr}^{-1}$  for chlordane and

$217\text{--}237 \text{ ng m}^{-2} \text{ yr}^{-1}$  for dieldrin which is 6-8 times higher than the measured deep-sea flux. (Author abstract). 31 Refs.

## Canada

**088918 RAINFALL AND RUNOFF EROSION INDICES FOR EASTERN CANADA.** Rainfall and runoff erosivity indices for the eastern Canadian provinces of Quebec and Ontario were calculated from the once-in-2 year, 6 h rainfalls. Isoerodent maps were then plotted. Annual erosivity indices which account for winter and snowmelt conditions are also included. A monthly distribution of the erosivity index is presented. Design personnel now have access to more precise erosivity indices, covering a wider geographical location. The availability of the isoerodent maps will enhance the quality of soil erosion and conservation studies in eastern Canada. (Author abstract) 10 refs.

**088919 RAINWATER ANALYSIS: A COMPARISON BETWEEN PROTON-INDUCED X-RAY EMISSION AND GRAPHITE FURNACE ATOMIC ABSORPTION SPECTROSCOPY.** Rainwater was collected and analyzed for trace metals by graphite furnace atomic absorption spectroscopy (GFAAS) and proton-induced x-ray emission (PIXE). For the PIXE analysis, a nonselective preconcentration technique was used to dry the samples onto polystyrene films. Good agreement was found in the concentrations for the elements determined in common (Cu, Fe, Mn, Pb, and Zn), even though the PIXE analysis had some problems with sample contamination. An advantage of the PIXE analysis is that 26 elements can be determined simultaneously. The elements P, S, K, Ca, V, Mn, Fe, Ni, Zn, As, Br, and Pb had concentrations significantly higher than the chemical blank and detection limits and thus could be routinely analyzed by PIXE. The technique is promising for the other elements Ti, Cr, Co, Cu, Ga, Ge, Se, Rb, and Sr. (Edited author abstract) 30 refs.

**088920 COMPARISON OF RADM AND OSCAR PRECIPITATION CHEMISTRY DATA.** This study examines the relationships between predictions of the Regional Acid Deposition Model (RADM) and observed precipitation chemistry patterns associated with frontal storm systems. Three episodes, monitored as part of the Oxidation and Scavenging Characteristics of April Rains (OSCAR) program and referred to as OSCAR I, OSCAR II and OSCAR IV, were analyzed. The temporal and spatial variations of chemical concentrations in rainfall and deposition of  $\text{SO}_4^{2-}$ ,  $\text{NO}_3^-$ ,  $\text{H}^+$  and  $\text{NH}_4^+$ , as well as rainfall amounts observed, at up to 36 stations, were compared with the corresponding RADM grid-average predictions. Quantitative comparisons for each grid-point pair were made using average fractional differences, which are defined as the difference in the observations and predictions divided by the sum of the observations and predictions. Study limitations and results are discussed. (Edited author abstract). 27 Refs.

## Chemistry

**088921 INFLUENCE OF ALTITUDE ON RAINFALL COMPOSITION AT GREAT DUN FELL.** The influence of altitude on rainfall composition and wet deposition has been investigated at Great Dun Fell in northern England. Measurements of rainfall at eight altitudes between 250 and 850 m on the western slopes of the hill show marked changes in both amount and composition when orographic cloud is present and a west or southwest wind is blowing. On average (20 precipitation events from Autumn 1984 and Spring 1985), the rainfall at the summit (847 m) exceeded that at 250 m by a factor of 2, and concentrations of  $\text{SO}_4^{2-}$ ,  $\text{NO}_3^-$ ,  $\text{Cl}^-$ ,  $\text{NH}_4^+$  and  $\text{H}^+$  were larger at the summit by factors of between 2.2 and 3.1. Thus, wet deposition at the summit was larger than at 250 m by about a factor of 5. The concentrations of major ions in orographic cloud at 847 m exceeded concentrations in rain by a factor of between 2.0 and 3.9. A large change occurred in the concentrations of major ions in orographic cloud with altitude, decreasing with increasing altitude from cloud base. Additional study results are discussed. (Edited author abstract). 13 Refs.

**088922 INFLUENCE OF ALTITUDE ON WET DEPOSITION COMPARISON BETWEEN FIELD MEASUREMENTS AT GREAT DUN FELL AND THE PREDICTIONS OF A SEEDER-FEEDER MODEL.** The influence of topography on rainfall rate and chemical composition has been investigated at Great Dun Fell in northern England. The measurements at eight different altitudes between 250 and 850 m above sea-level on the western slopes of Great Dun Fell (GDF) show, in the presence of a cap cloud on the hill and a west or southwest wind flow, a marked increase in both rainfall amount and concentration of major ions with altitude. Three case studies of the variation in rainfall rate and chemical composition with altitude when the seeder-feeder mechanism was operating are described and compared with model predictions. Associated measurements of the cap cloud microphysics and chemistry were also made. The case studies show close agreement between model predictions and measured values for changes in chemical composition and wet deposition with altitude. Additional aspects of the study are discussed. (Edited author abstract). 9 Refs.

## Classification

**088923 CLUSTERING DAILY RAINFALL RECORDS PRODUCES INDEPENDENT RANDOM VARIABLES IN STOCHASTIC HYDROLOGY.** A rain storm is defined to be a sequence of rainfalls that are originated from an individual synoptic-scale meteorological disturbance, such as a typhoon, frontal wave, etc. A concept of the rain cluster is introduced as the most conceivable substitute for the rain storm. The number of occurrences, and the amount of rainfalls, of the rain cluster can be taken as the new mutually independent random variables. Consequently, well-known probability distributions in the statistics can strictly be applied for the new variables, because these distributions are based on the assumption that the variables in question should be mutually independent and random. Other related concepts, such as a no-rain run and a cluster interval, are also introduced. A case study concerns with the daily rainfalls observed under AMeDAS from 1975 to 1986 at Hitoyoshi, Kyushu, Japan. (Edited author abstract) 17 refs.

**088924 USE OF RADAR DATA ON PRECIPITATION TO EVALUATE CLOUD-SEEDING RESULTS.** Described is a method of estimating the number of experimental units needed to establish the effect of cloud seeding in order to regulate precipitation. It is shown that the use of radar information on fields of precipitation in large areas, which is distinguished by higher spatial and temporal resolution than the rain gage grid, lets us obtain original data, based on which we can substantially improve planning and evaluating the results of experiments on active measure for regulating precipitation. Based on analyzing statistical characteristics of fields of precipitation layers during various time intervals conclusions are formed about the optimal placement of control polygons and the merit of shifting to shorter experimental units in regulating precipitation. ## Diffusion

**088925 CONSTANT RATE RAINFALL INFILTRATION: A VERSATILE NONLINEAR MODEL - 1. ANALYTIC SOLUTION.** Analytic solutions are presented for a nonlinear diffusion-convection model describing constant rate rainfall infiltration in uniform soils and other porous materials. The model is based on the Darcy-Buckingham approach to unsaturated water flow and assumes simple functional forms for the soil water diffusivity  $D(\theta)$  and hydraulic conductivity  $K(\theta)$  which depend on a single free parameter  $C$  and readily measured soil hydraulic properties. These  $D(\theta)$  and  $K(\theta)$  yield physically reasonable analytic moisture characteristics. The relation between this model and other models which give analytic solutions is explored. (Edited author abstract) 55 refs.

**088926 CONSTANT RATE RAINFALL INFILTRATION: A VERSATILE NONLINEAR MODEL - 2. APPLICATIONS OF SOLUTIONS.** In paper 1 (Broadbridge and White, this issue) an analytical nonlinear model for constant rate rainfall infiltration was proposed which promised considerable versatility. In it a wide range of soil hydraulic properties are generated through the variation of a single free parameter  $C$ . Here three techniques are advanced for determining this parameter. The first, a one-dimensional technique, involves simultaneous determination of sorptivity and wetting front position. The second uses measured values of surface water content at long infiltration times for rainfall rates less than the saturated conductivity. In the third, three- and one-dimensional flow rates are measured on the same soil sample. All are suitable for field applications. The mathematically simple, traveling wave approximation agrees well with observations at comparatively short infiltration times. Finally, field and laboratory measured times to ponding are predicted satisfactorily by the model's analytic expression. (Edited author abstract) 20 refs.

**088927 HYDROGRAPH ANALYSIS AS A BASIS FOR RAINFALL-RUNOFF MODELLING.** A great deal of information about the water balance of a catchment can be deduced by analysis of the hydrograph of runoff recorded at the outlet of the catchment. This paper describes procedures whereby inconsistencies between rainfall and runoff data, relationships between baseflow discharge and groundwater storage, partial areas of

surface runoff and surface storage capacities can be deduced by analysis of streamflow and rainfall records. The method is illustrated by analysis of data from the 7 sq km Back Creek catchment in southeastern Queensland. (Author abstract) 6 refs.

**088928 BACTERIAL UTILIZATION OF FORMIC AND ACETIC ACID IN RAINWATER.** Rain samples were collected aseptically, during 1983 and 1984, in Charlottesville, Virginia to determine the ability of bacteria in precipitation to utilize formate and acetate. The total number of bacteria, as counted by Acridine Orange Direct Counts, was one to two orders of magnitude greater from April to September ( $10^5$  cells  $\text{ml}^{-1}$ ) than during the rest of the year ( $10^3 - 10^4$  cells  $\text{ml}^{-1}$ ). Formate and acetate concentrations ranged between 6-23 and 3-9  $\mu\text{M}$  respectively and were higher from June to September. Heterotrophic uptake on the day of collection was not different from the controls, but after incubation at room temperature for a minimum of three days, the turnover rate constants were 0.14 and  $0.17\text{h}^{-1}$  for formate and acetate, respectively. Total bacterial counts increased an order of magnitude during that interval. These turnover rate constants were used to calculate losses of 44 and 24  $\mu\text{mol l}^{-1}\text{day}^{-1}$  of formic and acetic acid, respectively, and results are discussed. (Edited author abstract) 42 refs.

**088930 ON THE ACCURACY OF AREAL RAINFALL ESTIMATION: A CASE STUDY.** The issue of the accuracy of areal rainfall estimation is discussed through a case study on a catchment area in the Cevennes region of France. The basic tool for the analysis is a 'scaled estimation error variance' which is computed from a scaled climatological variogram model of the rainfall field. We show how this variance provides a theoretical criterion to compare the accuracy that can be expected with three linear estimators (Thiessen, spline, and kriging) for various networks' densities. To support the methodology an experimental validation of the scaled estimation error variance computation is performed, using 'reference' areal rainfall values computed with a very high density network. (Author abstract) 19 refs.

**088931 APPLICATION OF KRIGING TO ESTIMATING MEAN ANNUAL PRECIPITATION IN A REGION OF OROGRAPHIC INFLUENCE.** Estimates of mean annual precipitation (MAP) over areas are the starting point for all computations of water and chemical balances for drainage basins and surface water bodies. Any errors in the estimates of MAP are propagated through the balance computations. The failure of the raingage network to adequately sample the region of interest is evaluated by applying kriging in two different

approaches to estimating MAP in New Hampshire and Vermont, USA. The data base is the 1951-1980 normal precipitation at 120 raingages in the two states and in adjacent portions of bordering states and provinces. In the first approach, kriging is applied directly to the MAP values, while in the second, kriging is applied to a precipitation delivery factor that represents the MAP with the orographic effect removed. The second approach had a considerably smoother error surface and, thus, is generally preferable as a basis for point and areal estimates of MAP. (Edited author abstract) 44 refs.

**088932 ESTIMATION DE LAMES D'EAU SPATIALES A L'AIDE DE DONNEES DE PLUVIOMETRES ET DE RADAR METEOROLOGIQUE - APPLICATION AU PAS DE TEMPS JOURNALIER DANS LA REGION DE MONTREAL.** [Comparative Study of Areal Rainfall Estimation Methods Using Rain Gage and Radar Data - Application to Daily Rainfall Events Observed in the Montreal Region]. Several areal rainfall estimation methods using rain gage and weather radar data are reviewed including: (1) Thiessen's and Kriging methods relying on rain gage measurements only; (2) the classical cumulative procedure after transformation of reflectivity measurements using a standard Z-R relationship for conventional radar measurements alone; and (3) the uniform calibration method (using a constant multiplicative factor or a nonlinear regression) and the simplified cokriging method (previously proposed by the authors) for rain gage-radar combinations. The results show that the methods taking into account the spatial variability of rainfall (kriging, simplified cokriging) work much better than more classical approaches. Furthermore, the optimal combination of radar and rain gage information through simplified cokriging leads to better results than each measurement system alone for six out of eleven cases (especially for those presenting high areal variability). **088934 USING LIGHTNING FOR RAINFALL ESTIMATION IN FLORIDA.** The objective of this study was to evaluate the feasibility of using remote sensing methods, such as lightning technique, to quantify the area rainfall. Lightning and rainfall data collected during 1977 and 1978 by the Thunderstorm Research International Program located at the Kennedy Space Center were used in this study. The results showed that an increase of 1 lightning flash/min appears to be equivalent to an increase in rainfall of about 1.6 mm. Also, each increment in maximum flashing rate (FM) per minute is likely to be equivalent to increase of hourly rainfall by 1 mm. Using the FM appears to be a better tool for the area-average

rainfall (RA) estimation than using average flashing rate. The RA can be predicted based on the FM with an equation of  $RA = 0.467 + 0.562 FM$  ( $r^2 = 0.74$ ). (Author abstract). 18 Refs.

## Florida

**088935 VARIATION OF DAILY RAINFALL DISTRIBUTION IN SOUTH FLORIDA.** Daily rainfall data gathered from Lake Alfred, Ft. Myers, Clewiston, Belle Glade, and West Palm Beach Weather Stations were used in this study to analyze rainfall variation in south Florida. The results showed that the chance of rainfall occurrence is about 25% during the dry season (November through April) and 75% during the wet season (May through October). The chance of rainfall occurring during the second half of the dry season (February, March, and April) showed a significant decrease since 1960. A particularly significant decrease was shown for the month of April. This decrease in the chance of rainfall at the time of dry season could have a serious impact on water management in south Florida. (Author abstract) 10 refs.

Gages See Also AIR POLLUTION—Acid Rain; HYDROLOGY—Sampling; RADAR—Meteorological.

**088936 AUTOMATIC RAIN GAUGE FOR CONTINUOUS, REAL TIME DETERMINATION OF RAINWATER CHEMISTRY.** An automatic rain gage has been developed, capable of collecting rainwater and analyzing it continuously for the ions  $H^+$ ,  $NH_4^+$ ,  $Na^+$ ,  $Ca^{2+}$ ,  $NO_3^-$ ,  $Cl^-$ ,  $SO_4^{2-}$  and for dissolved  $H_2O_2$ . The wet-only rain collector, based on an inverting V-tray arrangement, is mounted on the roof of a small caravan, which contains the analysis equipment. Data are recorded on disk by a microcomputer, which also handles automatic calibration and other control functions. The caravan as a whole is a fairly comprehensive, transportable air and rainwater monitoring package. The advantage of the rainwater sampling method is that instantaneous concentrations are measured continuously rather than daily or weekly averages; and that problems of deterioration of stored samples are eliminated. (Edited author abstract) 18 refs.

**088937 LOW-COST COMPUTER INTERFACED RAIN GAUGE.** A conventional tipping bucket rain gauge was directly interfaced with a battery-powered portable lap top computer for digital data acquisition, storage, processing, and uploading to a mainframe computer system. A simple software program was written in BASIC to allow rainfall data recordings of each 0.254 mm of rain with a time resolution of 1 s. The method provides an inexpensive means to improve the time resolution of tipping bucket rain gauges, reduces the costs associated with data processing, and decreases data analysis time. (Author abstract) 15 refs.

Williams, R.G. (USDA, Tifton, GA, USA); Erdman, M.D. *Comput Electron Agric* v 2 n 1 Sep 1987 p 67-73.

**088938 ATMOSPHERIC DEPOSITION SAMPLER INTERCOMPARISON.** Two wet/dry atmospheric deposition sampler types were compared for 1 yr. The resistance required to open each of ten collectors was determined. Additionally, the opening and closing history of each sampler was recorded using a microdata logger with a resolution of 1 min. The frequency distribution of amount of time that a collector was open was used to evaluate the comparability of opening and closing of each collector. Weekly amounts of rainfall for each of the

collectors was used to determine the efficiency of collection as compared to a Belfort 5-780 weighing rain gage. The performance of a collector as determined by the efficiency of collection and also by the distribution of frequencies of times that a sampler was exposed to precipitation were statistically different for the different sampler configurations. (Author abstract) 10 refs.

**088940 OBJECTIVE RAINFALL EVALUATION IN RADAR HYDROLOGY.** A newly developed bivariate statistical analysis is compared to several rainfall analyses, namely the radar univariate analysis, the reciprocal-distance raingage interpolation model, the Brandes field adjustment procedure, and the 'optimum' raingage analysis. A number of statistics are also computed and used to evaluate the results. Several warm-season storms are examined over the Grand River basin above Cambridge in southern Canada. Based on the selected criteria, the analyzed storms indicate that, in general, most of the techniques in the comparison performed similarly, with the exception of the radar univariate analysis, which is considered unsatisfactory. (Author abstract). 20 Refs.

Dalezios, Nicolas R. (Intera Technologies Ltd, Calgary, Alberta, Can). *J Water Resour Plann Manage* v 114 n 5 Sep 1988 p 531-546.

**088941 DIGITISING PLUVIOGRAPHS.** A scheme for digitizing daily pluviographs from Dines-type automatic raingages is described. The data set derived from digitization consists of a division of time into periods of variable length in which rain is assessed as having fallen at a steady rate. The results obtained from the digitized data contain fewer errors than data extracted manually from the pluviographs. It is estimated that 98 percent of the rainfall in rain periods of any length lie within 0.1 mm of the true amount, and that the time resolution of the system is about 2.5 minutes. (Author abstract). 3 Refs.

## Hydrology

**088942 INFILTRATION INTO A UNIFORM SAND COLUMN WITH A CENTRAL, SMALL AND CYLINDRICAL SPACE FILLED WITH A COARSER SAND.** This paper deals with an investigation of the confined infiltration of rainwater into a heterogeneous field consisting of a uniform sand column (outer domain) which centrally contains a vertical, small coarser sand cylinder (inner domain) connected to the surface of the column. Attention is paid especially to the effect of pore air on the infiltration. At first, in order to examine the effect of the existence of the inner domain and its depth on the infiltration, an infiltration experiment under ponding and constant-flux conditions is carried out by changing the kind of sand of the inner domain, i.e., the diameter of the sand, and the diameter and depth of the inner domain, where the sand used is initially air-dry. During the experiment, water content, the pore-air pressure at the bottom of the sand column and the infiltration rate are measured. Next, the experimental results are discussed, using the fundamental equation of movement of water and

pore air and referring to the results for infiltration into a homogeneous sand column. (Edited author abstract) 15 refs.

## Israel

**088943 RAINFALL VARIATIONS IN THE GALILEE (ISRAEL), I. VARIATIONS IN THE SPATIAL DISTRIBUTION IN THE PERIODS 1931-1960, AND 1951-1980.** Mean monthly rainfall from different stations in the Galilee (northern Israel) for the periods 1931-1960 and 1951-1980, have been correlated with longitude, latitude and altitude of each station. A seasonal pattern of the explained variance ( $r^2$ ) by each of the variables has been found. At the beginning of the rainy season, the rainfall is correlated strongest with the longitude of the stations, during the main rainy season with the altitude and at the end of the rainy season with the latitude of the stations. In the latter period (1951-1980) the correlation with latitude is weaker than in the first period (1931-1960). The decrease in the correlation may be attributed to a shift in the depressions' tracks in the Eastern Mediterranean and to cloud seeding. (Edited author abstract) 19 refs.

Kutiell, H. (Univ of Haifa, Haifa, Isr). *J Hydrol* v 94 n 3-4 Oct 30 1987 p 331-344.

**088944 RAINFALL VARIATIONS IN THE GALILEE (ISRAEL), II. VARIATIONS IN THE TEMPORAL DISTRIBUTION BETWEEN 1931-1960 AND 1951-1980.** Mean monthly rainfalls from different stations in the Galilee (northern Israel) for the periods 1931-1960 and 1951-1980, have been correlated with longitude, latitude and altitude of each station. A seasonal pattern of the explained variance ( $r^2$ ) by each of the variables has been found. At the beginning of the rainy season the rainfall is correlated most strongly with the longitude of the stations, during the main rainy season with the altitude and at the end of the rainy season with the latitude of the stations. In the latter period (1951-1980) a retardation of the rainfall regime is observed. A greater portion of the annual total falls during the spring time (March-April) while a parallel decrease in the winter (January-February) rains is observed. The spatial distribution of this retardation and some of its implications are discussed. (Author abstract) 7 refs.

Kutiell, Haim (Univ of Haifa, Haifa, Isr). *J Hydrol* v 99 n 1-2 May 15 1988 p 179-185.

## Kerala, India

**088945 RAINFALL FREQUENCY STUDIES FOR KERALA REGION.** The daily rainfall data for 80 years from 98 stations in the Kerala region has been analyzed to arrive at the return periods of 2 to 100 years for rainfall durations of one to three days. The annual maximum values have been made use of to relate the magnitude of rainfall to return periods. Gumbel's extreme value distribution has been resorted to, considering its advantages. Frequency interpolation nomograms presented in the paper will be useful in estimating the return periods. The study will be of use to those involved in design of hydraulic structures. (Author abstract) 17 refs.

**088946 ARE RAIN RATE PROCESSES SELF-SIMILAR?** Scaling or self-similarity is an important issue which has attracted considerable attention and has partic-

ularly inspired a certain trend in rainfall modeling. We clarify the implication, with respect to self-similarity, of the facts that the probability of rain tends to increase with the size of the area of observation and that the distribution of rain rate contains an atom at zero. These properties observed in precipitation processes lead to subtle difficulties which are not compatible with self-similarity. (Edited author abstract) 4 refs.

Kedem, Benjamin (Univ of Maryland, College Park, MD, USA); Chiu, Long S. *Water Resour Res* v 23 n 10 Oct 1987 p 1816-1818.

**088947 ON PARAMETER ESTIMATION OF TEMPORAL RAINFALL MODELS.** Characteristics and moment estimators of temporal rainfall models such as Poisson rectangular pulse (PRP), Neyman-Scott white noise (NSWN), and Neyman-Scott rectangular pulse (NSRP) are investigated. It is shown that PRP and NSWN have a correlation structure like that of an autoregressive moving average (ARMA) (1, 1) model whereas the NSRP has a dependence structure like that of an ARMA (2, 2). The admissible regions of lag-1 and lag-2 autocorrelations are derived to demonstrate that in general they are more restricted than their ARMA counterparts. An additional property denoted as variance ratio, which is intimately related to the scale of fluctuation of a process, is defined and used for model comparison. The correlation and variance ratio plots are used to select the appropriate model for each month. (Edited author abstract) 16 refs.

Obeyskera, J.T.B. (Colorado State Univ, Fort Collins, CO, USA); Tabios, G.Q. III; Salas, J.D. *Water Resour Res* v 23 n 10 Oct 1987 p 1837-1850.

**088948 STATISTICAL MODELING OF SPACE-TIME RAINFALL USING RADAR AND RAIN GAGE OBSERVATIONS.** A statistical framework for modeling space-time rainfall using radar and rain gage observations is developed. Three principal tasks are involved in implementing our statistical model. These tasks are referred to as sampling (that is, characterization of the error structure of radar and rain gage measurements of rainfall, modeling), (that is, specification of a stochastic model for space-time rainfall), and parameter estimation. It is emphasized that sampling, modeling, and parameter estimation are interrelated and equally important tasks. Our statistical model is applied to daily rainfall fields in the tropical Atlantic region covered by the GATE experiment. (Author abstract) 25 refs.

Smith, James A. (Interstate Commission on the Potomac River Basin, Rockville, MD, USA); Krajewski, Witold F. *Water Resour Res* v 23 n 10 Oct 1987 p 1893-1900.

**088949 DISAGGREGATION OF DAILY RAINFALL.** A parameter-efficient model for disaggregating daily rainfall into individual storms is presented. This model allows simulation of the number of rainfall events (storms) in a day, and the amount, duration, and starting time of each event, given only the total rainfall on that day and on the preceding and following days. Twenty-three years of data for July and August, from a gage on the Walnut Gulch Experimental Watershed, were used to find the appropriate model structure and to estimate parameters. Statistical tests indicate that simulated sequences of storms compare favorably with observed sequences, and that the disaggregation model structure and parameters identified for one gage provide a satisfactory fit for three stations within a 121 km radius where elevation differs by as much as 244 m, and mean annual rainfall differs by up to 76 mm. (Author abstract) 21 refs.

**088951 DAILY RAINFALL-RUNOFF MODEL FOR A MOUNTAINOUS BASIN.** A new daily rainfall-runoff model for a mountainous basin is proposed in this paper. Its parameters are readily determined by hydrographic measurements. It is simple, relatively clear in its physical meaning, and includes all runoff components. In the model, a basin is considered to be composed of two parts: the saturated area and the infiltration area. Direct runoff parameters are determined from the relationship between storm rainfall and direct runoff. The groundwater runoff is expressed by the storage function and its parameter is determined from base-flow recession curves. In addition, moisture in excess of normal soil moisture is considered to become groundwater recharge. The applicability of the model is assessed by comparing it with observed data from an experimental basin in Japan. (Author abstract) 7 refs.

**088952 INTERPRETATION DE MESURES DU RADAR RODIN DE TRAPPES POUR LA CONNAISSANCE EN TEMPS REEL DES PRECIPITATIONS EN SEINE-SAINT-DENIS ET VAL-DE-MARNE: INTERET POUR LA GESTION AUTOMATISEE D'UN RESEAU D'ASSAINISSEMENT.** [Interpretation of Trappes Rodin Radar Measurements for the Real-Time Knowledge of Rainfall in Seine-Saint-Denis and Val-De-Marne: Advantages for the Automated Management of a Drainage System]. The project for the automated management of the Seine-Saint-Denis drainage system calls for an improvement of the techniques of measuring and forecasting rainfall. Rainfall measurement systems have certain inadequacies which weather radar can remedy. This work, which attempts to evaluate the capacity of radar to determine rainfall for purposes of urban hydrology, is based on a series of measurements over a period of two months during the summer of 1982. After a qualitative analysis of the data gathered, various techniques of calibration of radar images are tested. The results are compared with the estimation deduced from pluviographic measurements alone. The role of radar in the automated management project is envisaged. (Edited author abstract) In French. 76 refs.

**088953 RAIN MEASUREMENT RESULTS DERIVED FROM A TWO-POLARIZATION FREQUENCY-DIVERSITY S-BAND RADAR AT WALLOPS ISLAND, VIRGINIA.** A dual-polarization radar located at the NASA Wallops Flight Facility, Wallops Island, Virginia, is described. This radar operates with a slow polarization switch having a cycle time of 0.7 s and also incorporates a frequency diversity technique to achieve independent sampling over short intervals of time. Rain-rate measurements derived from the dual-polarization radar and from high-resolution rain gauges located at a remote site are compared. Average percent differences in rainfall of less than 5% and 16% were demonstrated when comparing the dual-polarization radar measurements with the low- and high-resolution rain gauges, respectively. Excellent correlation of the rain rates was in evidence during one rain day. The rain measurement cases examined were limited to only light rain rates (< 7 mm/h). 4 refs.

## North Carolina

**088954 EFFECT OF STORM TYPE ON RAINWATER COMPOSITION IN SOUTHEASTERN NORTH CAROLINA.** During 1983-1987, the most acidic rain and highest sulfate and nitrate concentrations occurred in rain from local summer thunderstorms, followed by rain from continental frontal storms, with the least acidic rain coming from coastal storms. Seasonal variation was observed for rainwater pH from continental storms, with the most acidic rain in the summer. Thunderstorm nitrate concentrations were high enough to affect seasonal averages for nitrate concentration because thunderstorms are a warm-season type of rain. Coastal storm rainwater did not show seasonal changes; this type of rainwater is similar in pH, sulfate, and nitrate concentrations to rainwater in remote areas of the world. Additional aspects of the study are discussed. (Edited author abstract) 47 refs.

## Radioactivity

**088956 DETERMINATION OF RADIOIODINE SPECIES IN RAIN WATER COLLECTED AT TSUKUBA NEAR TOKYO.** The distribution of radioiodine (<sup>131</sup>I) species in rain water collected at Tsukuba in May 1986 was studied using the isotopic exchange method. Organic-soluble forms of radioiodine were not observed. Iodide (I<sup>-</sup>) was the predominant species, and the concentration of iodate (I<sup>+</sup> O<sub>3</sub><sup>-</sup>) was less than half that of I<sup>-</sup>. The results were compared with those for <sup>131</sup>I produced by neutron-irradiation of uranyl nitrate. (Author abstract) 4 refs.

**088957 DUAL-POLARIZATION RADAR ESTIMATION OF RAINFALL PARAMETERS COMPARED WITH GROUND-BASED DISDROMETER MEASUREMENTS: OCTOBER 29, 1982 CENTRAL ILLINOIS EXPERIMENT.** Rainfall parameters estimated from dual-polarization radar measurements using the differential-reflectivity technique are compared with ground-based disdrometer measurements located 47.1 km from the radar. This case study is based on data obtained during and experiment in central Illinois on October 29, 1982. Both empirical and model relationships between radar observables and rainfall parameters are tested. The differential-reflectivity technique is compared with the conventional Z-R and is shown to provide improvements in the estimation of rainfall rate by radar. The analysis

includes consideration of the spatial and temporal factors relating the radar-scattering volumes to the location and duration of ground-based disdrometer measurements. The significance of these factors (mainly due to the horizontal and vertical motion of raindrops) in radar-disdrometer comparisons is evident in the results. 48 refs.

**088958 DESIGN AND USE OF A COLLECTOR FOR THE IN SITU ISOLATION OF PARTICULATE TRACE ORGANIC SPECIES IN PRECIPITATION.** Extracts of particulate organic matter were examined for discrete rainfall events from metropolitan Los Angeles, California, using an in situ filtration technique. Filtration efficiency was 98% for the collection of extractable organic C associated with particles having nominal diameters greater than 0.22  $\mu\text{m}$ . Organic background levels of less than 260 ng per sample were determined. Rainwater particle samples were extracted with repeated hexane and benzene: isopropanol (2:1) solvent additions using ultrasonic agitation. Extract mixtures were quantified by high-resolution gas chromatography (HRGC) and were adjusted for component losses with perdeuterated recovery standards. Molecular analyses indicated major anthropogenic contributions from petroleum and combustion sources, and for some samples, the significant input of microbial lipid components as well. Minor amounts of vascular plant waxes were also present in most cases. These mixed inputs of both anthropogenic and biogenic materials compared closely with previous source determinations for carbonaceous aerosol particles in the Los Angeles air basin. (Edited author abstract) 49 refs.

**088960 STORM PATTERN EFFECT ON INFILTRATION, RUNOFF, AND EROSION.** A programmable rainfall simulator was used to study the effects of variable intensity storm patterns on infiltration, runoff, and erosion. When rain was applied to an initially dry soil, peak runoff rates were four to 20 times greater from storms having maximum intensities occurring near the end of the storm than peak rates from storms of uniform intensity or storms having their maximum intensities occurring early in the storm. Soil loss from late peaking storms was two to eight times that from early peaking storms. Runoff and soil loss from a storm of a given pattern occurring on a wet soil was greatest when preceding storms had maximum intensities occurring very early in the storm. Apparent infiltration rate varied with rainfall intensity, which was likely caused by spatial variability of infiltration rates. (Author abstract) 26 refs.

**088961 RUNOFF AND EROSION FROM RAINFALL SIMULATOR PLOTS ON SAGEBRUSH RANGELAND.** A rainfall simulator was used to determine runoff, infiltration, and soil loss from 1 m<sup>2</sup> shrub and interspace plots on a sagebrush dominated site in southwestern Idaho. Interspace areas produced 2½ times as much runoff and 8 times as much soil loss as from shrub canopy zones at this range site. High soil moisture conditions preceding rainfall simulation runs resulted in lower infiltration rates, increased runoff, and no significant difference in soil losses. Removal of shrub canopy did not significantly influence soil losses. Results of this study show the importance of understanding spatial variability in infiltration and the wide differences in potential erosion from shrub and interspace areas when predicting sagebrush rangeland erosion and applying erosion models on rangeland. **088962 ANALYSIS OF ALGORITHMS FOR THE RETRIEVAL OF RAIN-RATE PROFILES FROM A SPACEBORNE DUAL-WAVELENGTH RADAR.** The ability to retrieve rain-rate profiles from a dual-wavelength spaceborne radar system operating at 13.6 and 35 GHz is analyzed. The fundamental problem of extracting either the attenuation and/or the reflectivity from the backscatter echo, which contains both contributions, is addressed. Three algorithms, the backscatter, the attenuation coefficient, and the dual-wavelength methods, are examined. These algorithms are tested using four rain-rate profiles derived from radar measurements. In particular, measured (true) values are compared with calculated (retrieved) rain rates applying the algorithms with superimposed uncertainties assuming a suggested spaceborne dual-wavelength radar system. Error values of rain rates are determined where these values reflect failure of the assumptions utilized in the derivation of the algorithms, rain backscatter noise, and instrument noise. It is concluded that no single technique gives rise to a panacea in the making of accurate rain measurements and that difficulties exist with each method. 28 refs.

**088963 RAMAN SCATTERING STUDIES IN A-Si:H FILMS CONTAINING MONO- & DI-HYDROGEN-LIKE SPECIES.** Structural disorder in the hydrogenated amorphous silicon (a-Si:H) films has been studied by Raman scattering (RS). The a-Si:H films were prepared by rf glow-discharge induced dissociation of silane diluted in argon. The order in these films was evaluated from the TO-bandwidth in their Raman spectra. The relative abundances of monohydrogen (Si-H) and dihydrogen-like species (H-Si-H) in these films were measured by IR absorption spectroscopy. The increase in disorder (as measured by Raman spectroscopy) is found to be directly related to the increase in intensity of the 2080 cm<sup>-1</sup> IR peak. (Edited author abstract) 30 refs.

**088965 EFFECTS OF GROUND STATE DEPLETION OF ATOMS IN STIMULATED RAMAN SCATTERING OF METAL VAPORS.** The effects of ground state depletion of atoms on the characteristics of stimulated Raman scattering in metal vapors are studied by simultaneously solving the rate-equation of the atom energy levels related in the Raman scattering, and the equations describing the energy-conversion from the focused pump laser pulses to the Raman down-converted pulses. The ground state of metal atoms are depleted most strongly in the regions near the focal spots of the pump beams because of the higher intensities of light and smaller available medium volume in those regions. This will result in the unsymmetrical shapes of the Raman-shifted pulses for the front and rear edges, and will reduce the energy-conversion efficiency. (Author abstract) In Chinese. 9 refs.

**088970 OPTIMUM SURFACE ROUGHNESS FOR SURFACE ENHANCED RAMAN SCATTERING.** Surface enhanced Raman scattering from copper phthalocyanine thin films deposited onto Ag films roughened by underlayers of gas-evaporated Si particles was investigated. The surface roughness was systematically varied by varying the average size of Si particles. Results of quantitative intensity measurements indicate that there exists an optimum surface roughness depth for SERS. The maximum enhancement factor obtained is approximately  $1.5 \times 10^4$  and a crude estimate of the optimum roughness depth is of the order of 100 Angstrom. The origin of presently observed enhancement is thought to be purely electromagnetic, involving the excitation of the surface plasmon modes via the surface roughness. (Author abstract) 12 refs.

1343-1345.

**Mathematical Models** See Also LIGHT—Amplifiers.

**088977 RAMAN SCATTERING BY LONGITUDINAL MODES IN IONIC SUPERLATTICES.** A linear response theory of Raman scattering by the longitudinal polar optical modes in ionic superlattices is considered. Derivations are first given for the characteristics response functions whose poles define the dispersion relation. This is examined in an application to a specific GaAs/Ga<sub>1-x</sub>Al<sub>x</sub>As superlattice predicting the familiar zone-folding effects. From the response functions we derive the scattering cross section, taking proper account of the polarization selection rules in cubic materials. This leads to the derivation of the Raman intensities of the folded modes and their variation with the scattering geometry. Results appropriate for the normal incidence backscattering case are deduced and compared with the corresponding experimental data. (Author abstract) 20 refs.

**088978 ROTATIONAL RAMAN GAIN SUPPRESSION IN H<sub>2</sub>.** We report measurements of rotational Raman gain suppression in H<sub>2</sub> in the transient regime. These measurements, along with qualitative observations of the Stokes spatial distribution under different gain conditions, demonstrate that the gain suppression is confined to a narrow region around the phase matching angle for collimated beams with relatively low gain per unit length. For focused beams with higher gain per unit length the suppressed region can extend to the forward direction, resulting in a two- to three-fold estimated increase in the Raman threshold. (Edited author abstract) 18 refs.

Duncan, M.D. (US Naval Research Lab, Washington, DC, USA); Mahon, R.; Tankersley, L.L.; Reintjes, J. *Opt Commun* v 64 n 5 Dec 1 1987 p 467-473.

**088979 RAMAN SCATTERING IN THE HIGH T<sub>c</sub> SUPERCONDUCTORS MBa<sub>2</sub>Cu<sub>3</sub>O<sub>7-x</sub>.** We report Raman scattering measurements of MBa<sub>2</sub>Cu<sub>3</sub>O<sub>7-x</sub> (M = Y, Sm, Eu) polycrystalline superconductors in the region of Cu-O stretching vibrations. Four peaks are seen. On the basis of the factor group analysis given here they are assigned to two Raman allowed and two ir-allowed LO modes. The latter are probably induced by disorder (e.g., O-vacancies). (Author abstract) 15 refs.

**088980 PICOSECOND STIMULATED RAMAN SCATTERING IN P<sub>2</sub>O<sub>5</sub>-SiO<sub>2</sub> BASED SINGLE MODE OPTICAL FIBRE.** Spectral and temporal investigations of cascade, picosecond, stimulated Raman scattering in SiO<sub>2</sub> based single mode optical fibre with a high (approximately 7 mol%) concentration of P<sub>2</sub>O<sub>5</sub> is reported. At a pump wavelength of 1.06  $\mu\text{m}$  and for peak powers of approximately 25 kW, enhancement in the spectrum at a frequency shift approximately 1300 cm<sup>-1</sup>

was observed due to the overlap of the 1st Stokes of the  $P=0$  vibrational mode (approximately  $1330\text{ cm}^{-1}$ ) and the third Stokes ( $3 \times 440\text{ cm}^{-1}$ ) of the Si-O-Si vibrational mode. This process provides the generation of a powerful source of picosecond pulses at  $1.24\text{ }\mu\text{m}$ . For higher peak powers launched into the fibre (approximately  $60\text{ kW}$ ) an intense continuum extending up to  $1.6\text{ }\mu\text{m}$  was recorded. (Author abstract) 19 refs.

**088981 THRESHOLD MEASUREMENTS OF STIMULATED RAMAN SCATTERING IN GASES USING PICOSECOND KRF LASER PULSES.** We have measured the thresholds of stimulated Raman scattering in a number of gases using 20 ps pulses from a Krf laser system. Stimulated scattering has been observed with methane, hydrogen, ammonia and sulphur hexafluoride below 5 atm pressure using pulse energies up to  $200\text{ }\mu\text{J}$ . Under the same conditions, no stimulated scattering could be obtained in oxygen or nitrogen. Measurements agree well with transient stimulated Raman scattering theory. (Author abstract) 20 refs.

## Calibration

**088984 METROLOGICAL SUPPORT TO LINEAR MEASUREMENTS IN THE RANGE 24-75,000 m.** The most effective standard means of measurement are calibrated baselines whose lengths are measured with certified standard rangefinders. When one determines the lengths of such measures, one uses comparator Invar wires or tapes and precision rangefinder. As development has not been completed on the metrological chain relating standard precision rangefinders to the primary standard for the unit of length, there are two lines of development in this test scheme. One is based on using engraved measures and basic instruments to determine the baseline lengths, with the instruments including 24-m Invar wires. The second metrological chain in the state test scheme is supported by the use of a precision rangefinder having a range of action up to  $10\text{ km}$  and a standard deviation  $\pm(0.3+5.10^{-7} D)\text{ mm}$ , where  $D$  is the measured length, which the is currently under test. Studies being conducted

to increase the range of action of the rangefinders to  $20\text{ km}$  without reduction in the accuracy. These rangefinders are to be used as standard means of measurement in devising a network of calibration baselines that are also to be used as precision working means of measurement for various economic purposes. 4 refs.

**088987 SIGNALLING AND TRAIN CONTROL - THE KEY TO URBAN MASS TRANSIT PERFORMANCE.** This paper identifies the performance aims of urban mass transit railways and describes how modern systems of signalling and train control, such as those developed for Singapore, contribute to the realisation of these aims. The three elements of Automatic Train Control are defined as Automatic Train Protection, Automatic Train Operation and Automatic Train Supervision, and each of these sub-systems and the functions it performs is described. The paper further describes how modern microprocessor digital signalling techniques are used to realise a highly versatile modular system that can meet the requirements of a wide range of applications. (Edited author abstract)

Howard, T.S. (Westinghouse Signals Ltd). *Hong Kong Eng* v 16 n 4 Apr 1988 p 23-30.

**088988 TAXI 2000 PERSONAL RAPID TRANSIT SYSTEM.** TAXI 2000 is the result of a comprehensive process of 'top-down' design optimization beginning 'from scratch' and subject to a variety of practical constraints. It builds on over two decades of work on automated transit in virtually every industrialized country and on a comprehensive theory of transit economics and technology developed by the author. The system's low cost is a result of discovery of optimum configurations and of technology advances not available a decade ago. The paper includes a description of the system and the process of and basis for its development; discussions of technical areas of dependability, safety, evacuation and rescue, power requirements, and performance; discussions of the

state of development, development plans, process of certification, and problems in implementation of the PRT concept. (Author abstract). 9 Refs.

**088989 RECENT PROGRESS BY JNR ON MAGLEV.** An overview is given of the Japanese National Railways (JNR) Maglev system, which uses superconducting magnet levitation and linear synchronous motor (LSM) propulsion. The progress made has included a speed of  $517\text{ km/h}$  reached by experimental vehicle ML500, a three-car test run by the MLU001 vehicle, manned test runs, and test runs with aberrations purposely introduced into the guideway. A maximum speed of  $352\text{ km/h}$  was achieved for the three-car train. After noting guideway and power supply facility components, the MLU001 and MLU002, the discussion centers on the vehicle body, carriages, superconducting magnets, and helium liquifier and refrigerator units. 14 refs.

## Automatic Train Control

**088991 DESIGN PRINCIPLES OF AUTOMATIC CONTROL FOR THE LONDON DOCKLANDS LIGHT RAILWAY.** The London Docklands light railway is an automated, intermediate capacity transit system serving the redeveloped Docklands area to the east of central London. A service interval down to  $3\text{ }1/3$  minutes is provided, and a system operating concept has evolved of unmanned (remotely supervised) stations, and automatically-driven trains carrying an attendant who supervises the train and checks tickets. This system concept has provided many challenges to signal engineers, to produce a control system which would meet all the operational requirements, without necessarily having the complexity (and cost) normally associated with a 'heavy rail' metro. (Author abstract)

Barnard, R.E.B. (GEC-General Signal Ltd, UK). *Electr Veh Dev* v 7 n 2 Apr 1988 p 52-54.

## Birmingham, United Kingdom

**088992 ELECTRIC METRO PROJECT LAUNCHED IN BIRMINGHAM.** A light rail passenger transit system to be known as the Midland Metro is being planned for an increase in the United Kingdom which will radiate from Birmingham and throughout the Black Country. Whenever possible, discussed railway lines and existing highways will be used as routes. (Author abstract)

Anon. *Electr Veh Dev* v 6 n 4 Oct 1987 p 127.

## Computer Aided Design

**088993 RELIABILITY OPTIMIZATION IN CABLE SYSTEM DESIGN USING A FUZZY UNIFORM-COST ALGORITHM.** Reliability optimization

methods for computer-aided design of a rapid-transit-system line that was previously proposed by the authors (1988) was useful for simple systems with a small number of sections. There is a combinatorial explosion in the time complexity for the computation of the configuration vector and the solution runs into difficulty very quickly with an increased number of sections. Use is made of a fuzzy optimization algorithm. This aspect is addressed here so that a more general problem can be solved. The strategy is to divide the system into smaller blocks and find solution sets for the smaller blocks using an efficient search strategy, which are then searched for an overall minimal solution. 10 refs.

## Computer Applications

**088994 OVERSEAS APPLICATIONS OF MICROCOMPUTERS ON A TRANSPORTATION PLANNING AND ENGINEERING DESIGN PROJECT.** Calibration of a complex four-step transportation modeling system, as well as testing of numerous alternatives were successfully accomplished on microcomputers. A wide range of engineering applications, structural analyses, cost estimation, project control and scheduling, and cost control tasks also were accomplished for which the microcomputer was found to be an indispensable tool. Tabulations of data and results, computer-generated graphics, and the word processing capabilities of microcomputers permitted the efficient production of a large number of complex project reports (in two languages) on time and in a cost-effective manner. Staff training of personnel without previous computer experience was surprisingly easy and was accomplished within a very short period of time due to the user friendliness of modern software. (Edited author abstract)

**088995 'TRACEC-ALPES' SUB-STATION COMPUTERS FOR THE TELECONTROL OF THE ELECTRICAL POWER DISTRIBUTION EQUIPMENT OF THE CHARLEROI LIGHT RAIL TRANSIT SYSTEM.** Within the framework of the construction of the Charleroi light rail transit system, some lines are in service, while others are under construction or only at the project stage. The power distribution telecontrol system must therefore adapt itself to network growth and, to achieve this, a distributed architecture has been designed and progressively brought into service which makes extensive use of the TRACEC-ALPES substation computers. The present article describes that part of the telecontrol system which is already operational. In a final stage, the telecontrol system will also be used to control traffic. (Author abstract)

**Costs** See **LIGHT RAIL TRANSIT—Buffalo, New York.**

## Environmental Impact

**088997 COMPARATIVE ENVIRONMENTAL IMPACTS OF DIFFERENT MODES.** While modern railway systems in general are considered to have comparatively low environmental impacts, high speed rail systems require special attention to ecological appraisal. Two case studies are presented - the new rail lines of the West German Federal Railways, and the Europe-an high speed rail project Paris-Brussels-Cologne/Amsterdam - which show that environmental compatibility can be costly and time-consuming. However, it would seem that the environment would not be a main issue for the proposed Amsterdam-Groningen-Hamburg connection if it primarily used existing rail lines. (Author abstract)

## Equipment

**088998 AERODYNAMICS OF URBAN TRANSIT VEHICLES.** The paper discusses the problems of wind loading of urban transit vehicles in the context of the overturning problem. It is shown that vehicles will respond to gusts of the order of only a few seconds in duration. The available aerodynamic information for vehicle shapes is reviewed, as is the nature of the wind environment in urban areas. The implications of these data are placed in simplified probabilistic perspective that suggests that the risk of overturning can become very significant if a number of factors are unfavorable. While the details of assessing the risks more precisely are described and have been developed in detail elsewhere, they cannot be applied to this problem until better information for particular cases is developed. Better data on both vehicle aerodynamics and the wind statistics for actual vehicle routes are needed. (Author abstract) 22 refs.

## Exhibitions

**088999 FUTURE OF TRANSIT TECHNOLOGY: LESSONS FROM EXPO 86.** Expo 86, the World Exposition held last year in Vancouver, Canada, was the largest, special-category world's fair ever staged, with 54 international participants. Given the designated theme of transportation and communications, it is interesting to interpret the statements made by the participants in regard to particular sub-theme areas such as urban transit. This paper reviews the presentations (exhibits, demonstrations, conferences, and seminars) developed by all participants in Expo 86 in regard to urban transit technology, and assesses the significance and direction of technological developments in the areas of vehicle and terminal design, network and system operation and control, and planning and management systems. (Author abstract) 3 refs.

## Guideways

**089001 GUIDEWAY DESIGN AND CONSTRUCTION FOR VANCOUVER ADVANCED LIGHT RAPID TRANSIT.** The Vancouver Advanced Light Rapid Transit (ALRT) System consists of 21.4 km of grade-separated guideway between the cities of Vancouver and New Westminster. Of the total length 16.6 km are elevated, 1.3 km are in tunnel, and 3.5 km are at grade. The guideway beam concept was developed in concrete with the requirement that direct track fixation be used without a second pour. The beams are post-tensioned, following erection into two- and three-span continuous structures, encastre at the internal supports, with single pot bearing at the expansion ends. Quality assurance for all materials and construction was critical to the successful completion and operation of the system. Production of the precast guideway beams for the project was undertaken by two separate contractors. The cost of the transit system including 114 vehicles and all operation and control equipment was budgeted for a maximum expenditure of \$854 million of which approximately \$240 million was for civil works for the guideway, stations, and maintenance yard. Construction of the guideway began in August 1983 and was completed in December 1985. The guideway began operation January 1, 1986 on time and on budget. (Edited author abstract)

Mills, Donald L. (Acres Int Ltd, Vancouver, BC, Can). *Can J Civ Eng* v 14 n 3 Jun 1987 p 347-362.

**089002 PRECAST GIRDERS FOR THE DECKS OF THE VANCOUVER RAPID TRANSIT SYSTEM.** The new metropolitan railway system stretches 21.40 km through Vancouver, to connect the port area to the suburban New Westminster district in only 27 minutes, comprising 13 intermediate stops. The route comprises 2 km of tunnel; 6 km run at grade level and 14 km on a viaduct running 6-8 m above ground level. 1118 straight and curved segments were precast having a varying box section. These girders were cast using form-works consisting of 1.50 m long elements mounted on a mobile frame, enabling the translation in both vertical and horizontal directions and permitting rotation so as to facilitate following the curved profile of the deck axis. (Author abstract) In Italian and English.

Anon. *Ind Ital Cem* v 57 n 11 Nov 1987 p 700-717.

**089003 NEW GUIDEWAY TRANSIT SYSTEMS.** The trend in Japan is toward a concentration of population in urban centers, resulting in traffic congestion, noise, and pollution. Thus, as a means of revitalizing population centers, hopes have been placed on new forms of pollution-free mass transportation, positioned between conventional train transportation and road traffic, and adapted to the urban environment. Since residential areas are often located far from the city centers, new transportation systems have emerged as a means for mass commuting from suburban homes to urban workplaces. These systems encompass both monorails and medium-capacity guided systems. The latter include conventional rubber-tire systems, as well as linear-motor-driven, steel-wheel guideway transit systems.

Takahashi, Keiichi (Mitsubishi Electric Corp, Tokyo, Jpn); Ono, Kazumi. *Mitsubishi Electr Adv* v 43 Jun 1988 p 2-3.

## Ireland

**089004 DUBLIN AREA RAPID TRANSIT.** The paper describes the principal elements of the Dublin Area Rapid (DART), together with details of project management during the construction phase, and operating experience since the service was introduced in 1984. The DART is a modern electrified transit system that runs on a 36 km double line route through Dublin. The system uses the latest developments in signalling, traffic control, and communication, to minimise the operating staff requirements. Chopper controlled semipermanently coupled units are combined to make 4 car or 6 car trains, to operate on the 1500 v dc electrified line from Howth to Bray, seven days a week. By using a blended regenerative-rheostatic

electric braking system, these units operate with minimum energy consumption for the required schedule speed. Remote control of all power switches, level crossing, and CCTV supervision, all contribute to maximum flexibility of system operation. DART was the first electrified line in Ireland. (Edited author abstract) 12 refs.

**089005 TECHNIK UND SICHERHEIT DES TRANSPRAPHID-SYSTEMS.** [Technology and Safety of the Transrapid System]. The use of the function principles of electromagnetic support and guidance technique and the synchronous iron-cored long-stator propulsion has permitted construction and realization of a transportation system with many outstanding features. Some of these properties can be proven by analyzing endurance tests under simulated operating conditions in the laboratory and test results of the Transrapid Test Facilities in Emsland at speeds up to 412 kmph. The results of testing of the guideway of the south loop of the TVE track, the prototype Transrapid 07 vehicle and of the new propulsion and operations control system form the basis for proving the serviceability of the Transrapid maglev system. 9 Refs. In German.

Marseilles, France

**089007 MARSEILLES INTEGRATED TRANSPORT SYSTEM.** To be fully effective, metro lines must be connected with other modes of transport. This principle has been applied in the city of Marseilles, France. First, a very good interchange between the two metro lines and the national and suburban railway has been developed in the Saint-Charles main railway station. This interchange connects with the adjacent intercity bus terminal. Second, at every metro station, access facilities and neighborhood development were planned. Third, bus stations and car parks were installed at main rail stations. All this was made possible by early coordinated planning. (Author abstract)

## Operations Research

**089008 DWELL TIME OF TRAMS ON CALCUTTA ROADS - A CASE STUDY.** The need to develop an estimation procedure of dwell time required for varying number of transit vehicle-users at scheduled stations is primarily felt for scheduling the operational modes. Properly apportioned dwell time at different stations, however, can optimize overall running time, curtail unused hauling time and ensure safety to the passengers while alighting from and boarding to the transit vehicles. Determination of the relationship between the number of users and dwell time is useful for scheduling trips in Metro Railways and other guided track vehicles such as light rail transits and trams. With necessary modifications, the concept may also be utilized in long distance bus services, railways and waterway services. (Author abstract) 1 refs.

Bhattacharya, A.K. (Transportation Planning & Traffic Engineering Directorate, Calcutta, India). *J Inst Eng India Part CI* v 68 Mar 1988 p 257-260.

**089009 QUICK ESTIMATION OF QUEUEING DELAY FOR PASSENGERS EXITING A RAPID TRANSIT STATION.** A method for estimating queueing delay for passengers exiting a rapid transit station is described. The method requires estimates of the average number of people exiting each train, average headway, and average service rate as inputs. The average delay is easily calculated with a hand calculator. (Author abstract). 2 refs.

Hall, Randolph W. (Univ of California, Berkeley, CA, USA). *Transp Res Rec* n 1152 1987 p 11-13.

## Personnel

**089010 CONVERSION TO ONE-PERSON OPERATION OF RAPID-TRANSIT TRAINS.** This report presents the findings and conclusions of a study (1) to evaluate the issues that must be addressed in contemplating conversion of two-person systems to one-person operation including the identification of those issues unique to the particular systems, and (2) to develop a framework for an economic assessment of the effects of implementation of one-person operation. No recommendations that any specific rapid transit system be converted from two- to one-person train operation were to be made. The principal effort of this study was associated with visits to 16 heavy-rail rapid-transit systems in the United States and Europe to solicit opinions and obtain data and information relative to the issues, problems, and problem solutions associated with conversion of heavy-rail rapid-transit systems to one-person train operation. (Edited author abstract) 8 refs.

Hoess, J.A. (Battelle Memorial Inst, Columbus, OH, USA); Murphy, P.J. *Rep Natl Coop Transit Res Dev Program* 13 Dec 1986 49p.

**089011 CONVERSION OF RAPID-TRANSIT TRAINS TO ONE-PERSON OPERATION.** Battelle Columbus Division in conjunction with the National Cooperative Transit Research and Development Program, recently conducted a study of one-person operation of multiple-unit trains for improving the cost-effectiveness of heavy-rail rapid-transit systems. On the basis of the study findings, it is judged that while there are many problems to be resolved, conversion of many of the six older U.S. rapid-transit systems with two-person operation of multiple-unit trains to one-person operation is technically feasible. Such conversion will generally follow an evolutionary process. That is, rather than systemwide conversion of all services and lines at one time, systems will most likely convert those services or lines that are most compatible to one-person operation first, followed by conversion of less compatible services or lines over time. The most compatible services include new lines, lines or services with new or rehabilitated cars or facilities, and

off-peak service. (Edited author abstract).

## Planning See Also SUBWAYS—Management.

**089012 TRANSIT SYSTEMS FOR TODAY'S URBAN POPULATIONS.** Urban transit projects require designers and builders to work closely with each other and the community to solve countless interlocking problems. An overview is given of how designers, builders and local residents have responded to these challenges. Some structures reviewed include: Washington D.C.'s Metro Center; Boston's Redline Subway Extension; Philadelphia's Frankford Elevated Railway; St. Louis's Light Rail Transit; Buffalo, New York's Light Rail Network.

Regan, Thomas J. Jr.; D'Eramo, Domenic E. *Constr Specifier* v 41 n 4 Apr 1988 p 74-83.

**089013 QUANTITATIVE ANALYSIS OF RAPID TRANSIT ALIGNMENT ALTERNATIVES.** Honolulu's first-stage rapid transit corridor was identified according to existing bus ridership. The first-stage corridor was divided into seven evaluation segments where all alternatives converge. The net total cost of each alternative for each segment was estimated, using a set of yardsticks. These yardsticks were developed to efficiently estimate the different costs and benefits of different alignment alternatives, without requiring detailed designs of each alternative or running elaborate computer models. The yardsticks estimate differences in rapid transit system costs, feeder bus costs, ridership generation, and joint development for each alignment alternative. The quantitative alignment and station evaluation methodology offers system designers a simple and reasonable way to make tradeoffs between different objectives.

**089014 WORKSHOP ON HIGH SPEED RAIL.** This workshop proceedings contains 6 papers. The topics discussed are: determinants of northern high-speed railway; regional impacts of new transport infrastructure - a multi-sectoral potentials approach; the regional impact of the TGV; comparative environmental impacts of different modes; forecasting passenger travel demand-international aspects; transport systems in the future. All papers are indexed and abstracted separately. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10580 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Ashley, D.J. (Ed.). *Transportation* v 14 n 2 1987, Workshop on High Speed Rail, Gieten, Neth, May 1987 p 97-165.

**089015 DETERMINANTS OF A NORTHERN HIGH-SPEED RAILWAY.** This is the first of two background papers sponsored for the Symposium by the Administrative Commission for the north of the Netherlands. The authors have assembled the available information on current rail travel patterns in the corridor of the proposed high speed rail line to Scandinavia and on the historical trends in travel in this corridor. On the basis of this information, their assessment of the likely future European high speed rail network and evidence on the elasticities of demand for rail travel, the authors have then estimated the traffic potential of the proposed Amsterdam-Groningen-Hamburg high speed rail link under four scenarios. (Author abstract) 8 refs.

Savelberg, Fons (Netherlands Economic Inst, Rotterdam, Neth); Vogelaar, Hans. *Transportation* v 14 n 2 1987, Workshop on High Speed Rail, Gieten, Neth, May 1987 p 97-111.

**089016 REGIONAL IMPACTS OF NEW TRANSPORT INFRASTRUCTURE: A MULTISECTORAL POTENTIALS APPROACH.** This is the second of two background papers sponsored for the Symposium by the Administrative Commission for the north of the Netherlands. Its purpose is to provide an indication of the effects of the proposed high speed rail line between Amsterdam, Groningen and Hamburg on employment in the corridor. The authors review the techniques of forecasting these effects discussed in the literature. The 'potentials' approach is adopted for their analysis, the mathematics and underlying assumptions of which are presented. This model is run to provide an estimate of the impact on regional employment of three variants of the proposed rail line. (Author abstract) 29 refs.

**089017 FORECASTING PASSENGER TRAVEL DEMAND - INTERNATIONAL ASPECTS.** The differing demand forecasting approaches adopted on a variety of European international travel studies are described in this paper. These include four models used on the studies of the Paris-Brussels-Cologne/Amsterdam high speed rail line, the model used in appraising the proposed Channel Tunnel rail services and the EC TASC model system. Contrasting features of these forecasting procedures are highlighted. (Author abstract) 6 refs.

## Poland

**089019 INCREASE IN TRAIN SPEEDS THROUGH MODERNISATION OF THE POLISH RAILWAY INFRASTRUCTURE.** The policy of Polish State Railways (PKP), quite apart from catering for introduction of higher speeds on a phased basis (120 km/h - 140 km/h - 160 km/h and over), also provides for thorough modernization of the entire system through: superstructure consolidation; development of electrification; automation of key marshalling yards; general introduction of automatic block signalling; modernization of several other installations. This ambitious program is gradually taking shape, despite the funding problems encountered. Already passenger train speeds are being steadily increased and freight transit times speeded up.

**Scheduling** See Also SUBWAYS—Sapporo, Japan.

**089020 PASSENGER DELAY IN A RAPID TRANSIT STATION.** An analytical queueing model for predicting passenger delay in a busy rapid transit station is developed and tested. The model accounts for the 'lumpy' arrival pattern of passengers exiting trains. Passenger delay is divided into two components: 'standard' delay and 'interference' delay. Standard delay is the delay incurred when all of the passengers on a train are served

before the next train arrives. Interference delay is the added delay when the next train arrives before all of the passengers are served. (Edited author abstract) 5 refs.

**089021 BISHAN DEPOT-ZENTRALWERKSTATT FUER DIE METRO SINGAPUR.** [Bishan Depot - Central Repair Shop for the Singapore Subway]. The most modern urban mass transportation system between Yio Chu Kang and Tao Payoh on November 7, 1987, the Bishan depot workshop was completed and commissioned in August 1987. The outstanding design of the maintenance and repair workshop equipped with custom-made top-quality facilities warrants reliability and attractiveness of the mass transportation system. A team of transportation, mechanical engineering, and control technique engineers, in cooperation with experienced project managers, successfully solved the difficult assignments which required the handling of a great number of interfacing activities. In German.

## Testing

**089022 ERSTE ERFAHRUNGEN BEI DER ERPROBUNG DER NEUEN S-BAHN-TRIEBZUEGE FUER DIE BERLINER VERKEHRS-BETRIEBE (BVG).** [First Experience with the New S-Bahn Multiple-Train Unit Testing for the Berlin Transit Service (BVG)]. The putting into service of four Type 480 S-Bahn twin-units by the BVG in Berlin solved several organizational and pressing problems. During the test period the prototype covered well over 100 000km and the knowledge gained led to optimization of supply filters and the motor controllers, as well as improvement of details which were likewise incorporated in the first build. Only a few points are still to be decided, balancing attractiveness against cost, and the manufacturers are now resolving them. (Author abstract) 4 refs. In German.

## United States

**089023 CHOOSING THE WRONG TECHNOLOGY: OR HOW TO SPEND BILLIONS AND REDUCE TRANSIT USE.** In spite of a broad consensus among transportation analysts that bus rapid transit, whether operating on exclusive rights-of-way or on uncongested high occupancy vehicle lanes or general purpose limited access facilities, provides higher performance and has significantly lower costs per passenger trip than rail transit in medium and low density cities, nearly all Sunbelt cities are building or planning heavy or light rail systems. This paper reviews previous studies of the cost-effectiveness of heavy and light rail transit with bus-rapid transit and the growing experience with busways and transitways and concludes, once again, that some form of bus rapid transit would be a far more effective way of providing improved transit in these cities than heavy or light rail transit. Not only would bus rapid transit be substantially cheaper, but it would provide a higher quality of service than light or heavy rail transit for virtually all users. Finally, the paper speculates on the reasons for the continued, 'blind' commitment to rail transit by policymakers in Sunbelt cities and on the refusal of policymakers in all but a few of these cities to even consider bus rapid transit. (Author abstract) 13 refs.

**089029 SOME NOVEL TERNARY  $\text{ThMn}_{12}$ -TYPE COMPOUNDS.** Ternary compounds based on the tetragonal  $\text{ThMn}_{12}$  structure are formed when rare earth elements (R) are combined with iron and elements M ( $\text{M} \approx \text{Si, Ti, V, Cr, Mo, or W}$ ). A structure determination was made for  $\text{NdFe}_{10}\text{Mo}_2$ , showing that the molybdenum atoms occupy only one of the three available crystallographic sites in this structure type. Detailed investigations of the systems  $\text{YFe}_{12-x}\text{V}_x$  showed that there is a substantial range of solid solubility extending approximately from  $x = 1.5$  to  $x = 3$ . Curie temperatures were determined for the two series  $\text{YFe}_{10}\text{M}_2$  and  $\text{GdFe}_{10}\text{M}_2$  and were found to depend strongly on the component M. (Author abstract) 5 refs.

**089030 BINARY PHASE DIAGRAMS OF THALLIUM WITH GADOLINIUM, TERBIUM AND DYS-PROSIUM.** The Tb-Tl and Dy-Tl systems have been studied by differential thermal analysis, X-ray examination, metallography, and microprobe analysis. A reinvestigation of the Gd-Tl system has been also carried out in the 35 - 47 at.% thallium composition range. In the Tb-Tl system the following intermetallic compounds exist:  $\text{Tb}_2\text{Ti}$  (decomposes at  $1040^\circ\text{C}$ ),  $\text{Tb}_5\text{Ti}_3$  (m.p.  $1290^\circ\text{C}$ ),  $\text{Tb}_5\text{Ti}_{3+2x}$ ,  $\text{TbTi}$  (m.p.  $1300^\circ\text{C}$ ),  $\text{Tb}_3\text{Ti}_5$  (decomposes at  $1000^\circ\text{C}$ ) and  $\text{TbTi}_3$  (m.p.  $940^\circ\text{C}$ ). The Dy-Tl system shows the following phases:  $\text{Dy}_2\text{Ti}$  (decomposes at  $1190^\circ\text{C}$ ),  $\text{Dy}_5\text{Ti}_3$  (m.p.  $1340^\circ\text{C}$ ),  $\text{Dy}_5\text{Ti}_{3+2x}$ ,  $\text{DyTi}$  (m.p.  $1300^\circ\text{C}$ ),  $\text{Dy}_3\text{Ti}_5$  (decomposes at  $1000^\circ\text{C}$ ) and  $\text{DyTi}_3$  (m.p.  $940^\circ\text{C}$ ). For both systems four eutectics and two peritectics occur. From the reinvestigation of the Gd-Tl system a congruent melting for the  $\text{Gd}_5\text{Ti}_3$  phase and the existence of a new phase ( $\text{Gd}_5\text{Ti}_{3+2x}$ ) have been proposed. (Edited author abstract) 21 refs.

**089031 RARE-EARTH-METAL COBALT PHOSPHIDES WITH  $\text{HoCo}_2\text{P}_2$ ,  $\text{Sc}_5\text{Co}_{19}\text{P}_{12}$  AND  $\text{YCo}_5\text{P}_3$ -TYPE STRUCTURES.** New ternary rare-earth-metal cobalt phosphides were prepared by reaction of the elemental components in a thin flux. The compounds  $\text{R}_5\text{Co}_{19}\text{P}_{12}$  ( $\text{R} \approx \text{Y, Gd - Lu}$ ) crystallize with the hexagonal  $\text{Sc}_5\text{Co}_{19}\text{P}_{12}$  structure, which was refined for  $\text{Ho}_5\text{Co}_{19}\text{P}_{12}$  from single-crystal counter data to a residual of  $R = 0.033$  for 746 structure factors and 24 variable parameters. The new compounds  $\text{GdCo}_5\text{P}_3$ ,  $\text{ErCo}_5\text{P}_3$  and  $\text{TmCo}_5\text{P}_3$  crystallize with the closely related  $\text{HoCo}_5\text{P}_3$ - and  $\text{YCo}_5\text{P}_3$ -type structures respectively. (Edited author abstract) 31 refs.

Jakubowski-ripke, Ursula (Univ Muenster, Muenster, West Ger); Jeitschko, Wolfgang. *J Less Common Met* v 136 n 2 Jan 1988 p 261-270.

**089032 COMPLEX FORMATION VS. DISPROPORTIONATION: LANTHANIDE(II) CHLORIDES,  $\text{MCl}_2$  ( $\text{M} \approx \text{Nd, Sm, Eu, Dy, Tm, Yb}$ ), UNDER THE INFLUENCE OF ALKALI CHLORIDES.** The products of the action of alkali metals ( $\text{A} \approx \text{Li, Na}$ ) on lanthanide(III) chlorides,  $\text{MCl}_3$  ( $\text{M} \approx \text{Nd, Sm, Eu, Dy, Tm, Yb}$ ), principally  $\text{ACl} + \text{MCl}_2$  or  $\text{LiCl} + \text{LiM}_2\text{Cl}_5$ , were reacted with CsCl in sealed tantalum containers. Complex formation ( $\text{CsMCl}_3$ ) and disproportionation (to  $\text{Cs}_2\text{AMCl}_6 + \text{M}$ ) are the competing reaction types. The presence of alkali chloride ( $\text{LiCl, NaCl}$ ) has no effect on complex formation of  $\text{M} \approx \text{Eu, Yb}$ , and only minimal effect for  $\text{M} \approx \text{Sm}$ . For  $\text{M} \approx \text{Tm}$  disproportionation is the principal and for  $\text{M} \approx \text{Dy, Nd}$  the exclusive process. (Edited author abstract) 17 refs.

**089033 ON THE TERNARY RARE EARTH ALLOYS:  $\text{RAlPb}$  COMPOUNDS.** The ternary phases of rare earths alloyed with gold and lead in the stoichiometric ratio 1:1:1 were studied by metallographic and X-ray analyses. Their structural characteristics are briefly discussed and compared with those of all the 1:1:1 ternary phases pertaining to the  $\text{CaIn}_2$ -type and the  $\text{MgAgAs}$ -type structures. The role of the dimensional factor in determining the structural type is examined. (Author abstract) 8 refs.

Marazza, R. (Univ di Genova, Genoa, Italy); Rossi, D.; Ferro, R. *J Less Common Met* v 138 n 2 Mar 15 1988 p 189-193.

**089034 ON THE TEMPERATURE DEPENDENCE OF HYDROGEN SITE OCCUPANCY IN RARE EARTH DIHYDRIDES.** Previous work claimed that the observed anomalous temperature dependence of octahedral(o)-site occupation in f.c.c. rare earth dihydrides could be explained by interaction effects not involving optic mode vibrations. We show that this conclusion was based on an erroneous assumption about the role of the chemical potential in determining the thermal equilibrium solution to lattice-gas-model equations. A correct derivation is given, and we conclude that such interactions cannot be the source of the anomaly. (Edited author abstract) 13 refs.

Patterson, J.D. (Florida Inst of Technology, Melbourne, FL, USA); Richards, Peter M. *J Less Common Met* v 138 n 2 Mar 15 1988 p 281-287.

**089035 TERNARY PNICTIDES  $\text{Mn}_{12-x}\text{Pn}_x$  ( $\text{M} \approx \text{Sr}$  AND RARE EARTH METALS,  $\text{Pn} \approx \text{Sb, Bi}$ ) WITH DEFECT  $\text{CaBe}_2\text{Ge}_2$  AND DEFECT  $\text{ThCr}_2\text{Si}_2$  STRUCTURES.** The compounds  $\text{Mn}_{12-x}\text{Sb}_x$  ( $\text{M} \approx \text{La, Ce, Pr, Nd, Sm, Gd, Tb, Dy, Ho, Er}$ ) and  $\text{Mn}_{12-x}\text{Bi}_x$  ( $\text{M} \approx \text{La, Ce, Pr, Nd, Sm, Gd, Tb, Dy}$ ) crystallize with a defect  $\text{CaBe}_2\text{Ge}_2$  structure, which was refined from single-crystal X-ray data for  $\text{LaNi}_{11.5}\text{Sb}_2$  ( $R = 0.014$  for 17 variable parameters and 328 structure factors).  $\text{SrNi}_{12-x}\text{Sb}_x$  and  $\text{EuNi}_{12-x}\text{Sb}_x$  have a defect  $\text{ThCr}_2\text{Si}_2$  structure, which was refined for  $\text{EuNi}_{11.5}\text{Sb}_2$  to a residual of  $R = 0.030$  (10 variables, 189 structure factors). The compounds have relatively large homogeneity ranges with differences in the cell volumes of up to 3%. The temperature dependence of the electrical conductivity of  $\text{LaNi}_{12}$  is associated with conversion of heavy-rail  $-x\text{Sb}_2$  indicates metallic behavior. Some results of phase equilibria studies of the corresponding ternary systems are reported. (Edited author abstract) 20 refs.

Hofmann, W.K. (Univ Dortmund, Dortmund, West Ger); Jeitschko, W. *J Less Common Met* v 138 n 2 Mar 15 1988 p 313-322.

**089036 NEW  $\text{Th}_2\text{Si}_2$ -TYPE REPRESENTATIVES,  $\text{LnCr}_2\text{Si}_2$  ( $\text{Ln} \approx \text{Sm, Tb - Lu}$ ).** New  $\text{LnCr}_2\text{Si}_2$  phases with  $\text{Ln} \approx \text{Sm, Tb - Lu}$  were synthesized and shown to crystallize in the  $\text{ThCr}_2\text{Si}_2$  structure. In these metallic compounds chromium carries no localized magnetic moment. Ytterbium in  $\text{YbCr}_2\text{Si}_2$  is virtually trivalent at room temperature. Of all  $\text{LnCr}_2\text{Si}_2$  phases only  $\text{GdCr}_2\text{Si}_2$  and  $\text{TbCr}_2\text{Si}_2$  order magnetically above 1.6 K.  $\text{YCr}_2\text{Si}_2$  and  $\text{LuCr}_2\text{Si}_2$  are not superconducting down to this temperature. (Author abstract) 21 refs.

Dommann, A. (ETH, Zurich, Switz); Hulliger, F.; Baerlocher, Ch. *J Less Common Met* v 138 n 1 Mar 1 1988 p 113-121.

**089037 CRYSTAL STRUCTURE AND FLUORESCENCE PROPERTIES OF  $\text{R}_2\text{Zr}_2\text{O}_7$  AND  $(\text{R}_{1-x}\text{Eu}_x)_2\text{Zr}_2\text{O}_7$  COMPOUNDS.**  $\text{R}_2\text{Zr}_2\text{O}_7$  and  $(\text{R}_{1-x}\text{Eu}_x)_2\text{Zr}_2\text{O}_7$  ( $\text{R} = \text{La, Pr, Sm, Eu, Gd, Tb, Er, Y}$ ) were prepared at  $1600^\circ\text{C}$  in air and their fluorescent properties were studied. The crystal structures of these compounds were pyrochlorite-type for the light rare earths and  $\text{CaF}_2$ -type for the heavy rare earths, respectively. However,  $\text{Gd}_2\text{Zr}_2\text{O}_7$  and  $\text{Y}_2\text{Zr}_2\text{O}_7$  showed broad and small (111) X-ray diffraction peaks which are characteristic of the pyrochlorite-type structure. Further, annealing at  $1500^\circ\text{C}$  increased the intensity and the sharpness of the (111) peak of  $\text{Gd}_2\text{Zr}_2\text{O}_7$ . When the compounds were excited by the 254 nm line, only the Eu-doped  $\text{La}_2\text{Zr}_2\text{O}_7$ ,  $\text{Gd}_2\text{Zr}_2\text{O}_7$  and  $\text{Y}_2\text{Zr}_2\text{O}_7$  showed emission spectral due to  $\text{Eu}^{2+}$  ions. (Edited author abstract) 6 refs.

Otaki, Hitoshi (Osaka Municipal Technical Research Institute, Osaka, Japan); Kido, Hiroyasu; Hoshikawa, Takeshi; Shimada, Masahiko; Koizumi, Mitsue. *Yogyo Kyokai Shi* v 96 n 2 1988 p 124-126.

**089038 X-RAY DETERMINATION OF DEBYE TEMPERATURES OF SOME RARE EARTH DIALUMINIDES.** Debye temperatures, Debye-Waller factors and r.m.s. amplitudes of vibrations are calculated for seven rare earth dialuminide intermetallic compounds from  $\text{LaAl}_2$  to  $\text{ErAl}_2$  with increasing atomic number of the rare earth element. The values of Debye temperatures obtained by the researchers by the X-ray method are compared with those available from elastic and specific heat measurements. It is observed that the Debye temperature decreased from  $\text{LaAl}_2$  to  $\text{PrAl}_2$  and increased from  $\text{DyAl}_2$  to  $\text{ErAl}_2$  except for  $\text{GdAl}_2$  which showed an increased Debye temperature. A plot of the Debye temperature vs. the reciprocal of the lattice parameter showed the deviation of  $\text{GdAl}_2$  from the other rare earth dialuminide compounds investigated. (Edited author abstract) 19 refs.

Appa Rao, B. (Osmania Univ, Hyderabad, India); Bhaskara Sastry, V.; Kistiah, P.; Satyanarayana Murthy, K. *J Less Common Met* v 139 n 2 May 1988 p 241-247.

**089039 NATURE OF THE  $4f$  SPIN IN HIGH  $T_c$  SUPERCONDUCTORS CONTAINING PARAMAGNETIC RARE-EARTH ELEMENTS  $\text{REBa}_2\text{Cu}_3\text{O}_{7-y}$  ( $\text{RE} \approx \text{Gd, Dy, Ho, Er AND Tm}$ ).** Single-phase high  $T_c$  superconductors,  $\text{REBa}_2\text{Cu}_3\text{O}_{7-y}$  ( $\text{RE} \approx \text{Gd, Dy, Ho, Er AND Tm}$ ) were prepared and their magnetic susceptibilities were measured from 77 to 300 K. The obtained Curie-Weiss temperatures were  $-1.2, -5.8, -2.1$  and  $-14$  K for  $\text{Dy}^{3+}, \text{Ho}^{3+}, \text{Er}^{3+}$  and  $\text{Tm}^{3+}$  respectively, indicating that the  $4f$  spins are delocalized to a small extent and the orbital quenching occurs in the normal conducting range. This was supported by the results of electron spin resonance (ESR) measurements. The influence of the magnetic spins on the superconductivity and the relaxation mechanisms responsible for the ESR line-shapes are discussed. (Author abstract) 11 refs.

**089040 SYNTHESIS AND CRYSTAL STRUCTURE OF  $\text{K}_2\text{U}_2\text{O}_7$  AND MOSSBAUER ( $^{237}\text{Np}$ ) STUDIES OF  $\text{K}_2\text{Np}_2\text{O}_7$  AND  $\text{CaNpO}_4$ .**  $\text{K}_2\text{U}_2\text{O}_7$  single crystals have been synthesized from a melt containing uranium, niobium oxides and potassium carbonate. The crystal structure of  $\text{K}_2\text{U}_2\text{O}_7$  has been determined. This study led to three possible distributions for the oxygen vacancies: on the uranyl bond, on the oxygen atoms of the equatorial plane of the uranyl polyhedron or on both of these two sites. A Mossbauer ( $^{237}\text{Np}$ ) study of the isotopic compound  $\text{K}_2\text{Np}_2\text{O}_7$  showed that the vacancies are located on the oxygen positions in the equatorial plane of the neptunyl ion. Mossbauer spectra of  $\text{CaNpO}_4$  have been recorded at 4.2 K and 77 K. The isomeric shift value for

this compound has been attributed to a neptunium (VI) ion with a coordination number of eight. (Edited author abstract) 7 refs.

Jove, Jose (CNRS, Paris, Fr); Cousson, Alain; Gasperin, Madeleine. *J Less Common Met* v 139 n 2 May 1988 p 345-350.

**089041 THERMOELECTRIC POWER OF RZnSi COMPOUNDS.** The thermoelectric power,  $S$ , of ternary rare-earth zinc silicides  $RZnSi$  was measured. The absolute values of  $S$  increased linearly with temperature, and the value of  $dS/dT$  for  $RZnSi$  decreased with increasing atomic number of rare-earth atom,  $Z$ . These results and the speculation on the basis of a free electron model indicated that the change in  $S$  and  $dS/dT$  with increasing  $Z$  of  $RZnSi$  was caused by the change in the concentration of conduction electrons due to the lanthanoid contraction. (Author abstract) 6 refs.

**089042 TEMPERATURE-DEPENDENT ENERGY TRANSFER FROM  $^5D_3$  AND  $^5D_4$  STATES OF  $Tb^{3+}$  TO  $Sm^{3+}$ .** The present study deals with the interaction of  $^5D_3$  and  $^5D_4$  states of  $Tb^{3+}$  when  $Sm^{3+}$  ions are incorporated in a  $LaCl_3$  matrix. A dipole-dipole interaction mechanism is suggested for the transfer of energy from  $^5D_3$  and  $^5D_4$  states of  $Tb^{3+}$  to  $Sm^{3+}$ . Temperature-dependent study reveals multiphonon relaxation of the  $LaCl_3$  matrix. (Author abstract) 12 refs.

**089043 CALCULATION OF ELECTROSTATIC CRYSTAL FIELD PARAMETERS OF RARE EARTH HYDRATED SINGLE CRYSTALS.** The calculation of point charge and dipolar contributions to the crystal field parameters is outlined and the properties of the latter are discussed. This procedure is applied to Pr-ethylsulfate and Yb-ethylsulfate. The positions of the dipole centres and charge centres are estimated on the basis of the structure of these two compounds. The computed total crystal field parameters, taking the screening and scaling factors into consideration, are in reasonable agreement with those derived from experimental data except for  $C_{20}$ . (Edited author abstract) 18 refs.

**089044 NEW TERNARY COMPOUNDS:  $RMnGa$  (R: RARE EARTH METALS) AND THEIR SPIN GLASS-LIKE BEHAVIOUR.** We have found a series of ternary compounds  $RMnGa$  (R: rare earth metals) hitherto unknown. They have a crystal structure with a high symmetry; a cubic Laves phase,  $C15$ . Electrical resistivity and magnetic susceptibility were measured from the liquid He temperature to the room temperature. The most of these samples were found to show spin glass-like behavior. (Author abstract) 7 refs.

## Aging

**089045 BEHAVIOUR OF RARE EARTH SESQUIOXIDES EXPOSED TO ATMOSPHERIC CARBON DIOXIDE AND WATER.** The behavior of the rare earth sesquioxides, when exposed to atmospheric water and carbon dioxide under ordinary conditions of temperature and pressure, is reviewed. Data corresponding to eleven samples from seven different oxides systematically investigated by x-ray diffraction (XRD), IR spectroscopy, thermogravimetry (GT) and temperature-programmed decomposition (TPD), are reported. The BET surface areas of all these samples are also given. In accordance with the results summarized, upon exposure to air, the

lanthanide sesquioxide all become hydrated and carbonated in bulk. In some cases, the behavior has been found to depend on the origin of the samples, which prevents the generalization of definite sequences of reactivity for the whole series of oxides. (Edited author abstract) 73 refs.

**089046 DETERMINATION OF 13 RARE EARTH IMPURITIES IN HIGHLY PURE  $Gd_2O_3$  BY P215-HCl EXTRACTION CHROMATOGRAPHY-ICP-AES.** A new chemical-ICP-AES method for the determination of 13 rare earth (La to Nd, Sm, Tb to Lu, Y) impurities in high purity  $Gd_2O_3$  was represented. The RE impurities were separated from the matrix and concentrated by extraction chromatography in which a new extractant di (1-methyl heptyl) phosphoric acid (P215) was used as the stationary phase. Then the ICP emission spectrometry was employed to determine the trace amounts of RE impurities. All the result data of 13 RE could be read directly from the terminal of a computer at the same time. Hence the new method is rapid.  $25\text{ cm}^3$  of  $0.28\text{ mol/dm}^3$  HCl was used to elute elements from La to Sm first. Then  $45\text{ cm}^3$  of  $0.5\text{ mol/dm}^3$  HCl was applied to elute the matrix Gd, and finally  $120\text{ cm}^3$  of  $2.0\text{ mol/dm}^3$  HCl was employed to elute elements from Tb to Lu and Y. Experimental result showed that both good recovery and precision were obtained. This method can be applied to determining trace amounts of RE in  $Gd_2O_3$  with a purity more than 99.999%. **089047 SEPARATION OF LIGHTER RARE EARTH METAL IONS BY CENTRIFUGAL COUNTERCURRENT TYPE CHROMATOGRAPHY WITH DI-(2-ETHYLHEXYL)PHOSPHORIC ACID.** A centrifugal countercurrent type chromatography (Centrifugal Partition Chromatography) was applied to separations of lighter rare earth metal ions ( $LaCl_3$ ,  $CeCl_3$ ,  $PrCl_3$ ,  $NdCl_3$ ,  $SmCl_3$  and  $EuCl_3$ ) first time. The results obtained by using di-(2-ethylhexyl)phosphate (D2EHPA) showed that this technique is successfully usable for the laboratory-scale separations, though the numbers of theoretical plate calculated from the chromatograms were considerably lower than expected. **089048 ELASTIC BEHAVIOUR OF  $Ce_3S_4$  AND  $La_3S_4$ .** The hydrostatic pressure and temperature dependences of the elastic stiffnesses of the cubic,  $Th_3P_4$  structure compounds  $Ce_3S_4$  and  $La_3S_4$  have been measured using the ultrasonic pulse echo overlap technique. Although  $Ce_3S_4$ , unlike  $La_3S_4$  ( $T_c = 103\text{ K}$ ), does not undergo a phase transition when its temperature is lowered to 16 K, its elastic stiffnesses soften with decreasing temperature (in a similar manner but less markedly than those of  $La_3S_4$ ); this lattice instability indicates an incipient phase transition. In both compounds the elastic constants increase under pressure: the long-wavelength

acoustic-mode Gruneisen parameters are all positive, and the application of pressure does not induce acoustic phonon-mode softening. (Author abstract) 8 refs.

Crystallization See Also FERROELECTRIC MATERIALS—Synthesis.

**089049 CRITICAL POINT FOR THE VALENCE TRANSITION IN  $Sm_4Bi_3$ .**  $Sm_4Bi_3$  which crystallizes in the cubic anti- $Th_3P_4$  structure undergoes a first-order, isostructural valence transition near 26 kbar pressure at ambient temperature. Thermoelectric power exhibits a distinct anomaly at this pressure-induced phase transition. A significant result of the present high-pressure, high-temperature study is that the semimetal-metal phase boundary in the P-T plane terminates at a critical point. (Author abstract) 12 refs.

## Decomposition

**089050 THERMAL DECOMPOSITION OF CURIUM TETRAFLUORIDE AND TERBIUM TETRAFLUORIDE.** The thermal decompositions of both curium and terbium tetrafluorides have been studied using mass spectrometry to monitor the effluent from a Knudsen cell containing the condensed fluoride. Curium tetrafluoride was found to decompose at  $330-430^\circ\text{C}$  in vacuum. A Second Law enthalpy of  $26.3 \pm 2\text{ kcal/mole}$  (at  $370^\circ\text{C}$ ) is derived from van't Hoff plots of results obtained for the decomposition reaction. Decomposition fluorine pressures are derived and comparison is made with related studies of terbium tetrafluoride carried out in conjunction with the curium experiments. The results are compared both with data reported in the literature for lanthanide and actinide tetrafluorides and with predictions that have been made for  $CmF_4$ . (Author abstract) 16 refs.

## Dehydration

**089051 THERMAL DEHYDRATION OF  $Ln$ -MONTMORILLONITE ( $Ln = La, Nd, Gd, Ho, Yb, Lu$ ).** The present work aims to study the dehydration behavior of montmorillonite saturated with  $Ln(III)$  ( $Ln = lanthanum, neodymium, gadolinium, holmium, ytterbium, lutetium$ ). In a previous paper the anomalous pattern of lutetium on dehydration of the lanthanide trihydroxides to the sesquioxides was shown. In the present letter the dehydration reaction of hydrated  $Lu(III)$ , as a montmorillonite exchangeable cation, is compared with the dehydration reaction of the other lanthanides. At the same time, the very recent relationship found between the slope of the thermogravimetric diagrams (in the temperature range  $250$  to  $450^\circ\text{C}$ ) and the nature of  $ns$  and  $(n-1)d$  exchangeable cations has been applied to the 4f ions. 10 refs.

## Elasticity

**089052 ELASTIC MODULUS-POROSITY RELATION IN POLYCRYSTALLINE RARE-EARTH OXIDES.** Many equations have been previously proposed to describe the elastic modulus-porosity relation of brittle solids. The equations are not applicable to all materials over a wide range of porosity. A new equation representing elastic modulus-porosity relation of brittle solids has been proposed. It has been shown that the proposed

equation describes best the Young's modulus-porosity data of six rare-earth oxides over a wide range of porosity reported by previous investigators. The equation suggests that there was some kind of ordered packing in all the oxides. (Author abstract) 23 refs.

**089053 ELECTRICAL CONDUCTION IN NON-METALLIC RARE-EARTH SOLIDS.** The energy band model proposed more than fifty years ago has been quite successful in explaining the genesis of charge carriers in semiconductors. Schematic energy band diagrams for the genesis of charge carriers in non-metallic rare-earth solids have been presented. It has been shown that positions of 4f bands have significant effect on the genesis and nature of charge carriers, their conduction mechanism and magnitude of electrical conductivity ( $\sigma$ ) and Seebeck coefficient ( $S$ ) of the solid. Relevant relations have been given for both  $\sigma$  and  $S$  in different situations. Experimental data on rare-earth sesquioxides ( $\text{R}_2\text{O}_3$ ), rare-earth tungstates [ $\text{R}_2(\text{WO}_4)_3$ ] and rare-earth molybdates [ $\text{R}_2(\text{MoO}_4)_3$ ] in the intrinsic range have been explained as examples for the validity of energy band diagrams. (Edited author abstract) 24 refs.

## Electrochemistry

**089057 ELECTROCHEMICAL BEHAVIOR OF RARE-EARTH MAGNET ALLOYS IN VARIOUS SOLUTIONS.** Electrochemical behavior of rare earth magnet alloys  $\text{SmCo}_5$ ,  $\text{Sm}_2\text{TM}_{17}$ , and  $\text{Nd-Fe-B}$  in various aqueous solutions was investigated. Although they are very reactive both in air and aqueous solutions, passivation is still possible in orthophosphoric acid. The ability to passivate, the passivated current density, and breakdown voltage of the passivated films were found to be related to the content of rare earth element, single- or multiple-phase state, and iron content of the alloys, respectively. Galvanic current density of the coupled pairs between one of the magnet alloys and one of the biomedical alloys (amalgam, Co-Cr, and Ni-Cr alloys) was found to be within 3-15  $\mu\text{A}/\text{cm}^2$  in synthetic saliva. However a large value of 25  $\mu\text{A}/\text{cm}^2$  between a Nd-Fe-B magnet and a Ni-Cr alloy was observed. 8 refs.

## Electrolysis

**089058 PREPARATION METHODS OF RARE EARTH METALS AND THEIR ALLOYS.** This review describes the main applications, a short history of the past preparation methods and applications, and today's major preparation methods which include molten salt electrolysis and metallothermic reduction of rare earth salts. Special attention is devoted to the recent developments of the production processes for obtaining the metals and precursor alloys which are used as raw materials to produce high-performance rare earth-transition metal permanent magnets. Production processes for neodymium metal, however, will be described separately in the issue appearing in the near future. (Author abstract). 169 Refs. In Japanese.

**089059 COLOUR GROUPS AND SPIN WAVES. SYMMETRY ANALYSIS OF THE SPIN WAVE SPECTRUM IN HEXAGONAL MANGANITES  $\text{LMnO}_3$  ( $\text{L} = \text{Er}, \text{Ho}, \text{Lu}, \text{Sc}, \text{Tm}, \text{Y}$ ).** The calculation of the spin wave spectrum by the symmetry analysis method is given in this work. The symmetry calculations are based on the P-type color group as the symmetry group of magnetic structure. It is consistent with the exchange approximation of the spin wave Hamiltonian. The method is applied to the spin wave spectrum calculation for hexagonal manganites  $\text{LMnO}_3$  ( $\text{L} = \text{Er}, \text{Ho}, \text{Lu}, \text{Sc}, \text{Tm}, \text{Y}$ ) and wave vector  $q = (0, 0, \mu)$ . As a result the 4 spin wave branches dependent on 4 exchange integrals are given, two of which are nondegenerated. The  $\lambda^2(q) \rightarrow 0$  with  $q \rightarrow 0$  for two branches. (Author abstract) 14 refs.

**089060 MEAN-FIELD THEORY OF INTERMEDIATE VALENCE/HEAVY FERMION SYSTEMS.** In recent years the class of materials known as intermediate valent, Kondo-lattice or heavy-fermion systems has aroused much interest. The unusual properties of these

materials arise from the behavior of their 4f- (or 5f-) electrons. The strong electron-electron interactions within the 4f shell cause the f-bands of these rare earth or actinide metal containing species to show very high masses. Thus the densities of states are very high, leading to correspondingly high specific heats and magnetic susceptibilities. A mean field theory is described, based on the Anderson lattice model, in which these properties are straightforwardly explained. Its relationship to the  $1/N$  expansion, and the corrections to mean field, are outlined. (Author abstract) 79 refs.

## Extraction

**089061 INTERFACIAL EFFECTS IN A MULTI-STAGE MIXER-SETTLER OPERATION.** A pilot-scale mixer-settler with twenty-one stages was used to investigate the interfacial tension change during extraction cycle for the complicated system:  $\text{NdCl}_3\text{-SmCl}_3\text{-EuCl}_3\text{-GdCl}_3\text{-TbCl}_3\text{-DyCl}_3\text{-HCl}$ -1 D2EHPA-kerosene. Interfacial tension, total rare earth (TRE) concentrations in both phases, aqueous acidities, and organic entrainment in the raffinate, etc., were measured for each stage. Murphree stage efficiencies based on organic phase were calculated and related to the interfacial tension profiles. In general, the lower the interfacial tension, the higher the stage efficiency observed. For the extraction section, the stage efficiency ranged from 80 percent - 100 percent, but for stripping (including scrubbing) section, it varied from 100 percent - 15 percent. For high acidic stripping agent, 5 M HCl, the relatively lower stage efficiency might be due to the protonation of the acidic extractant, therefore the interfacial resistance increased significantly. From the information of stage efficiency, mass transfer direction, and interfacial tension versus solute concentration etc., the Marangoni effect could be used to explain the interfacial phenomena of this complicated extraction system. The results of real stream tests in this investigation will be useful in future plant design. (Author abstract). 24 Refs.

**089063 ANGULAR DEPENDENCE OF THE COERCIVE FORCE OF TEXTURED RARE EARTH PERMANENT MAGNETS.** On the basis of model calculations experimental results on the angular dependence of the coercivity  $H_c$  and the remanence coercivity  $H_p$  of hard magnetic materials of the type  $\text{SmCo}_5$ ,  $\text{Sm}_2(\text{Co, Fe, Cu, Zr})_{15}$  and  $\text{Nd}_2\text{Fe}_{14}\text{B}$  are discussed. In the model coherent rotation as well as incoherent magnetization jumps (e.g.,  $180^\circ$ -Bloch walls) are included. The texture is described by an axial symmetric distribution of the easy axes with only one parameter. For  $\text{Sm}_2(\text{Co, Fe, Cu, Zr})_{15}$  the model explains irreversible ( $H_R(\theta)$ -curves as well as reversible ( $H_R(\theta) - H_c(\theta)$ ) magnetization processes in good agreement with the experiments, whereas stronger deviations exist for  $\text{SmCo}_5$  and  $\text{Nd}_2\text{Fe}_{14}\text{B}$ , especially in the  $H_R(\theta)$ -curves. These deviations should be caused by other reversible magnetization processes. (Author abstract) 37 refs.

**089064 DIRECT CALCULATION OF THE ENERGIES OF MAGNETIC STRUCTURES IN COMPOUNDS WITH RKKY EXCHANGE.** The model of indirect exchange interaction of localized spins developed by Ruderman and Kittel, Kasuya and Yoshida on the basis of the s-d model of S.V. Vonsovskiy has proved fruitful in investigation of the magnetic properties of a number of compounds of rare earth metals. The energy of a system of localized magnetic moments interacting via conduction electrons by means of indirect RKKY exchange can be expressed mathematically. The proposed method for improving convergence of the lattice sums gives a simple calculation for the RKKY exchange energy in different magnetic structures. Unlike approximate methods, high accuracy can be obtained and the adequacy of the actual RKKY model in a given compound judged reliably. 9 refs.

**089065 ANISOTROPY OF THE MAGNETIZATION AND OF THE IRON HYPERFINE FIELD IN  $\text{R}_2\text{Fe}_{17}$  COMPOUNDS.** A single crystal of the hexagonal  $\text{Y}_2\text{Fe}_{17}$  compound has been prepared. The exact composition,  $\text{Y}_2\text{Fe}_{18.9}$  has been refined through X-ray measurements. A large anisotropy of the magnetization is associated with the large magnetocrystalline anisotropy. Moessbauer experiments have been performed at 4.2 K under high magnetic fields. A large anisotropy of the orbital contribution to the hyperfine field is deduced. This can explain the anomalies of the hyperfine field observed in  $\text{Tm}_2\text{Fe}_{17}$  and  $\text{ErFe}_3$  when magnetization reorientations occur with temperature. (Author abstract) 13 refs.

Averbuch-Pouchot, M.T. (Lab de Cristallographie, Grenoble, Fr); Chevalier, R.; Deportes, J.; Kebe, B.; Lemaire, R. *J Magn Magn Mater* v 68 n 2 Aug 2 1987 p 190-196.

**089066 ON THE TEMPERATURE DEPENDENCE OF THE SUBLATTICE MAGNETIZATIONS IN  $\text{TbCu}_2$ .** Calculations based on molecular and crystal field models were used for the interpretation of the temperature dependence of the sublattice magnetizations found by neutron diffraction in the antiferromagnetic compound  $\text{TbCu}_2$ . The observed dependence is explained as a result of comparable amounts of exchange and crystal field energy in this compound. (Author abstract) 5 refs.

Divis, M. (Charles Univ, Prague, Czech); Zajac, S.; Sima,

V.; Smetana, Z. *J Magn Magn Mater* v 68 n 2 Aug 2 1987 p 253-256.

**089067 MAGNETIC PROPERTIES OF SOME  $\text{RCO}_2\text{B}_2$  AND  $\text{RCO}_4\text{B}_4$  COMPOUNDS.**  $\text{RCO}_2\text{B}_2$  ( $\text{R} = \text{Pr, Nd, Sm, Gd}$ ) and  $\text{RCO}_4\text{B}_4$  ( $\text{R} = \text{Pr, Nd, Sm}$ ) compounds have been investigated by X-ray and magnetometry techniques in the temperature range 4.2-300 K. These compounds crystallize in tetragonal crystal structures of the types  $\text{CeAl}_2\text{Ga}_2$  and  $\text{CeCo}_4\text{B}_4$ , respectively, with lattice parameters decreasing for increasing atomic weight of the rare earth ion. All compounds order magnetically with the Curie temperatures much below room temperature. Anomalous magnetic behavior is observed for  $\text{RCO}_4\text{B}_4$  alloys. (Author abstract) 12 refs.

Jurczyk, M. (Carnegie-Mellon Univ, Pittsburgh, PA, USA); Pedziwiatr, A.T.; Sankar, S.G.; Wallace, W.E. *J Magn Magn Mater* v 68 n 2 Aug 2 1987 p 257-260.

**089068 THERMAL AND MAGNETIC PROPERTIES OF  $\text{TbCl}_3$ .** The specific heat of polycrystalline  $\text{TbCl}_3$  was measured in the temperature range  $1.65 \text{ K} < T < 100 \text{ K}$ . Magnetization and susceptibility of  $\text{TbCl}_3$  were determined on polycrystalline and single crystal samples between  $1.7 \text{ K} < T < 350 \text{ K}$ . Our experimental data show ferromagnetic order of  $\text{TbCl}_3$  below  $T_c = (3.65 \pm 0.03) \text{ K}$ . The magnetic entropy  $S_{\text{mag}}$  lost during ordering as calculated from the specific heat nearly corresponds to  $\ln 2$  indicating the ordering of a  $S = \frac{1}{2}$  magnetic system. In the ordered state the magnetic moment orients along the crystallographic  $a$ -axis. The saturation moment is  $(8.1 \pm 0.1) \mu_B$ . The critical parameters  $S_{\text{mag}}(T_c)$  and  $T_c/\theta$  are determined and compared with theoretical calculations for 3D-Ising magnets. Our results are in best agreement with a previous neutron investigation performed by Murasik et al. (Author abstract) 30 refs.

**089069 MAGNETIC PROPERTIES OF  $\text{RNi}_2\text{Si}_2$  COMPOUNDS ( $\text{R} = \text{RARE EARTH}$ ).** We report an extensive study of the magnetic properties of tetragonal  $\text{RNi}_2\text{Si}_2$  compounds ( $\text{R} = \text{Pr, Nd, Gd, Tb, Dy, Ho, Er, Tm}$ ), through resistivity, neutron diffraction, susceptibility and magnetization experiments. All compounds exhibit complex incommensurate antiferromagnetic structures, while a transition occurs in  $\text{TbNi}_2\text{Si}_2$  between a modulated phase and a simple antiferromagnetic structure, stable at low temperature. The magnitude of the bilinear exchange interactions deviates from the Gennes law and the direction of the ordered magnetic moments presents anomalies across the series, including the probable existence of other types of interactions between the rare earth ions. (Author abstract) 28 refs.

Barandiaran, J.M. (Univ del Pais Vasco, Lejona, Spain); Gignoux, D.; Schmitt, D.; Gomez Sal, J.C.; Rodriguez Fernandez, J. *J Magn Magn Mater* v 69 n 1 Oct 1 1987 p 61-70.

**089070 EFFECT OF RHODIUM SUBSTITUTION ON THE MAGNETIC PHASE TRANSITIONS IN  $\text{Ho}(\text{Co}_{1-x}\text{Rh}_x)_2$ .** A detailed study has been made of the magnetic properties of the cubic Laves phase compounds  $\text{Ho}(\text{Co}_{1-x}\text{Rh}_x)_2$  with  $x = 0.02; 0.05; 0.08; 0.12; 0.16$  and  $0.25$ ; with particular attention given to the nature of magnetic phase transitions. Pronounced discontinuities are observed at the magnetic ordering temperature of the compounds with  $x < 0.1$ , indicative of a predominantly first order magnetic phase transition. In alloys with  $x > 0.1$  the transition is second order. However, the change from first order to second order is not sudden but gradual. This change in the character of phase transition has been attributed to a reduction in the exchange field acting on cobalt atoms as a result of rhodium substitution. This series has been compared and contrasted with  $\text{Ho}(\text{Co}_{1-x}\text{X}_x)_2$ , where  $\text{X} = \text{Ni}$  and  $\text{Cu}$ . (Author abstract) 10 refs.

**089071 MAGNETIC AND  $^{57}\text{Fe}$  MOSSBAUER STUDIES OF COLLINEAR SPIN ROTATION IN  $\text{Ho}_2\text{Fe}_{14}\text{B}$ .** Magnetic properties of  $\text{Ho}_2\text{Fe}_{14}\text{B}$  compounds have been studied by the  $^{57}\text{Fe}$  Mossbauer effect and magnetization measurements. The axes of easy and hard magnetizations lie along the  $[001]$  and the  $[100]$  directions in the tetragonal structure, respectively, above  $T_{SC} = 58 \text{ K}$ . From the comparison of the Mossbauer results with the magnetization measurements, it became clear that the Fe and the Ho moments tilt collinearly from the  $c$ -axis to the  $[110]$  direction throughout the temperature range of 4.2-58 K, and the canting angle reaches to  $22^\circ$  at 4.2 K. The Mossbauer spectra are consistently resolved with six subspectra above  $T_{SC}$  and with twelve below  $T_{SC}$ , together with reasonable site-assignments. We have estimated the mean Ho moment at  $10.0 \mu_B$ , using the mean Fe moment of  $2.3 \mu_B$  derived from the average hyperfine field or using the magnetization of  $\text{Y}_2\text{Fe}_{14}\text{B}$  as the Fe-sublattice magnetization of  $\text{Ho}_2\text{Fe}_{14}\text{B}$ . (Author abstract) 23 refs.

**089072 MAGNETOELASTIC COUPLING AND SPIN REORIENTATION IN  $\text{RECo}_5$  UNIAXIAL MAGNETS ( $\text{RE} = \text{Pr, Dy, Ho}$  AND  $\text{Y}$ ).** II. Magnetostriiction measurements, between approx. 5 and 300 K, of powder aligned samples of the uniaxial compounds  $\text{RECo}_5$  ( $\text{RE} = \text{Pr, Ho, Dy}$  and  $\text{Y}$ ) for strong applied magnetic fields up to 15 T are reported. The strains have been measured, parallel, perpendicular and at  $45^\circ$  from the  $c$ -axis, with the field applied also along these directions. These sets of measurements allow us to determine the six irreducible magnetoelastic coupling constants. Anomalies on the strains, associated with the spin reorientation (SR) regime are observed. The thermal variation of the strains is well explained by the standard magnetostriction model including as ingredients exchange striction and the single-ion anisotropic one, as well as a dependence on the angle of reorientation under field. The point charge model of the crystalline magnetoelastic field is far from agreement with the present results. (Edited author abstract) 42 refs.

del Moral, A. (CSIC, Zaragoza, Spain); Algarabel, P.A.; Ibarra, M.R. *J Magn Magn Mater* v 69 n 3 Nov 1987 p 285-298.

**089073 SPIN GLASS BEHAVIOUR IN THE RARE EARTH TERNARY STANNIDE  $\text{HoRh}_{1-x}\text{Sn}_3$ .** Dynamic susceptibility measurements on  $\text{HoRh}_{1-x}\text{Sn}_3$  have been performed in the vicinity of its magnetic transition at  $T_M = 1.7 \text{ K}$ .  $\chi'(T)$  exhibits a cusp-like peak, which is substantially depressed when an external field of a few mT is applied. Below  $T_M$  a strong frequency dependence of the susceptibility is found. The results are very similar to those of classical spin glass systems. This fact, together with an analysis of the structural disorder present in this compound, indicates also a spin glass behavior for  $\text{HoRh}_{1-x}\text{Sn}_3$ . Results on other phase II ternary stannides as, e.g., the reentrant magnetic superconductor  $\text{ErRh}_{1-x}\text{Sn}_3$  may be interpreted likewise. (Author abstract) 21 refs.

**089074 CONDUCTION ELECTRON POLARIZATION EFFECTS IN  $\text{Gd}_{1-x}\text{RE}_x\text{Ag}$  ( $\text{RE} \equiv \text{Y, Lu, La, Er}$ ).** The magnetic susceptibilities of  $\text{Gd}_{1-x}\text{Y}_x\text{Ag}$ ,  $\text{Gd}_{0.5}\text{Lu}_{0.5}\text{Ag}$ ,  $\text{Gd}_{0.5}\text{La}_{0.5}\text{Ag}$  and  $\text{Gd}_{0.5}\text{Er}_{0.5}\text{Ag}$  compounds were measured over a large temperature range. The Curie-Weiss law is obeyed for all investigated samples. The effective magnetic moments per gadolinium atom are higher than the theoretical values. The gadolinium concentration dependence of the excess moment has been

analysed and the best estimate was obtained when the susceptibility of the gadolinium 5d electrons is taken into account. (Edited author abstract) 17 refs.

**089075 MAGNETIC STRUCTURE CHANGES OBSERVED BY NEUTRON DIFFRACTION IN THE SYSTEM  $TbGe_{1-x}Si_x$  ( $0.4 \leq x \leq 1.0$ ).** Various Si-rich compounds ( $0.4 \leq x \leq 1.0$ ) of the type  $TbGe_{1-x}Si_x$  (CrB-type) were studied by means of neutron diffraction over an extensive temperature range. As a function of temperature and concentration three different magnetically ordered phases were observed. These comprise the commensurate antiferromagnetic structures with propagation vectors  $k=[001/2]$  and  $k=[1/2 \ 0 \ 1/2]$ , and an incommensurate magnetic structure with a propagation vector  $k=[q_x \ 0 \ q_z]$ . For a fixed composition and with increasing temperature the values of  $q_x$  and  $q_z$  were found to decrease and increase, respectively. All transitions between magnetically ordered phases were observed to be of first order. The experimental data obtained in the course of the present investigation, together with those obtained previously, have been used to construct a magnetic phase diagram for the system  $TbGe_{1-x}Si_x$ . (Author abstract) 17 refs.

**089076 MAGNETIC BEHAVIOR OF  $R_2Fe_{14}B$  HYDRIDES ( $R=Gd, Tb, Dy, Ho$  AND  $Er$ ).**  $R_2Fe_{14}B$  systems, with  $R=Gd, Tb, Dy, Ho$  and  $Er$  were hydrogenated to the composition  $R_2Fe_{14}BH_x$ , where  $x$  ranges from 3.7 to 5.4. The determination of saturation magnetizations  $M_s$ , Curie temperatures  $T_C$ , spin-reorientation temperatures  $T_{SR}$  and anisotropy fields  $H_A$  of the fully hydrogenated  $R_2Fe_{14}B$  systems ( $R$ =a heavy rare earth) is reported. These are compared to the data for the host materials. In addition, the dependence of the lattice dimensions,  $M_s$ ,  $T_C$ ,  $T_{SR}$  and  $H_A$  on hydrogen concentration for two systems, the Gd- and Dy-containing compounds, were established. (Edited author abstract) 18 refs.

**089077 MAGNETIC ANISOTROPY IN THE SYSTEM  $La_2Fe_{14-x}Co_xB$  AND ITS RELATION TO THE SYSTEM  $Nd_2Fe_{14-x}Co_xB$ .** We have studied the system  $La_2Fe_{14-x}Co_xB$  by means of X-ray diffraction, magnetic measurements and singular point detection (SPD) measurements. We present experimental data on the concentration dependence of the lattice constants, Curie temperatures, saturation magnetization and anisotropy fields. Attention is mainly given to the determination of anisotropy fields, which were also studied as a function of temperature in the range from 4.2 K to the corresponding Curie temperatures. The experimental information obtained for the system  $La_2Fe_{14-x}Co_xB$  was used to distinguish the relative anisotropy contributions of the neodymium sublattice and 3d sublattice in  $Nd_2Fe_{14-x}Co_xB$ . **089078 MAGNETIC MOMENTS AND LOW-TEMPERATURE HEAT CAPACITY IN A MAGNETIC FIELD OF SOME  $REPd_3$  COMPOUNDS.** Magnetization measurements on single crystalline  $REPd_3$  ( $RE=Pr, Nd, Dy, Ho$ ) intermetallic compounds in the temperature range 2 to 100 K and for magnetic fields up to 8 T are discussed. Also we present measurements of the molar heat capacity on polycrystalline  $REDd_3$  ( $RE=Pr, Nd, Tb, Dy, Ho, Er$ ) compounds for different magnetic fields in the temperature range 1.5 to 17 K. The experimental results are interpreted in terms of a cubic crystalline electric field using a simple molecular field approximation for the exchange interaction. A comparison of the

reduced crystal field parameters for the  $REPd_3$  compounds shows systematic behavior and supports the physical relevance of the applied Model. (Author abstract) 21 refs.

Drewes, W. (Univ Muenster, Muenster, West Ger); Leson, A.; Schelp, W.; Purwins, H.G. *J Phys F Met Phys* v 18 n 1 Jan 1988 p 137-152.

**089079 FIRST ORDER MAGNETIZATION PROCESS IN  $Pr_2Fe_{14}B$  SINGLE CRYSTAL.** High-field magnetization process in  $Pr_2Fe_{14}B$  single crystal has been studied in static magnetic fields up to 230 kOe. The spontaneous magnetization is along the [001] direction of the tetragonal structure down to 1.5 K. When the field is applied along the [100] and [110] directions at low temperatures, magnetization jumps are observed at about 130 kOe and 160 kOe, respectively, which are considered to correspond to the first order magnetization process (FOMP). Observed features of the magnetization curves including FOMP and their temperature dependence are well reproduced by the calculations based on a simplified Hamiltonian. (Edited author abstract) 11 refs.

**089080 EFFECT OF  $Dy$  AND  $Co$  SUBSTITUTIONS ON THE SPIN-REORIENTATION PHENOMENA IN  $Tm_2Fe_{14}B$  ALLOYS.** Partial substitution of Fe by Co atoms (up to  $x=4$ ) in  $Tm_2Fe_{14-x}Co_xB$  alloys results in an increase of spin-reorientation temperature. This is believed to be due to a change in the magnetocrystalline anisotropy from a plane to an easy axis with increasing temperature. In contrast, gradual replacement of Tm by Dy results in a marked decrease in the spin-reorientation temperature. This is attributed to the stronger crystal field interaction in Dy-rich systems. Both Co and Dy substitutions in  $Tm_2Fe_{14}B$  enhance the magnetic ordering temperature. A magnetic phase diagram is proposed on the basis of results obtained in this study. (Author abstract) 15 refs.

**089081 CRYSTAL STRUCTURE AND MAGNETIC PROPERTIES OF  $RE_2In$  COMPOUNDS.** This paper reports on the structural and magnetic properties of the binary compounds  $RE_2In$  ( $RE \equiv Ce, Nd, Gd, Tb, Dy, Ho, Er$ ) measured by X-ray diffraction and magnetometry. The crystal structure of  $RE_2In$  compounds is hexagonal and of the  $Ni_2In$  type. For these compounds, the chemical bonding is analyzed taking into account the interatomic contacts controlling the cell dimensions. The results of magnetometric measurements show that the samples are ferromagnetic, except  $Ce_2In$  and  $Er_2In$  which are paramagnetic. The magnetic properties of  $RE_2In$  compounds are discussed. (Edited author abstract) 5 refs.

**089082 X-RAY EXAMINATION, ELECTRICAL AND MAGNETIC PROPERTIES OF  $R_3Co$  SINGLE CRYSTALS ( $R \equiv Y, Gd, Dy$  AND  $Ho$ ).** Single crystals of  $Y_3Co$ ,  $Gd_3Co$ ,  $Dy_3Co$  and  $Ho_3Co$  were obtained by the Czochralski method from a levitated melt. A description of the crystal growth technology is given. The crystal quality was examined by X-ray methods. Electrical resistivity and magnetic susceptibility have been measured.  $Y_3Co$  exhibits Curie-Weiss behavior with  $\mu_{eff} = 1 \mu_B$  (formula unit)<sup>-1</sup>. It is the first evidence for the existence of a magnetic moment on cobalt atoms in such a low concentration region.  $Gd_3Co$ ,  $Dy_3Co$  and  $Ho_3Co$  show an effective moment that is enhanced by  $1 \mu_B$  relative to the theoretical value for  $R_3Co$ , assuming that only the  $R^{3+}$  ions contribute a magnetic moment equal to the free ion value. (Edited author abstract) 12 refs.

**089086 MAGNETIC DOMAINS AND DOMAIN WALL ENERGIES IN RARE EARTH-IRON-BORON INTERMETALLICS.** Using the Bitter technique magnetic domain structures have been observed in single crystals of  $Gd_2Fe_{14}B$  and  $Dy_2Fe_{14}B$  and in large grains of  $Nd_2Fe_{14}B$  and  $Ho_2Fe_{14}B$ . By measuring the spacing  $W_1$  of domain boundaries on surfaces perpendicular to the easy c-axis values of domain wall energy  $\gamma$  have been obtained using the technique of Bodenberger and Hubert. Calculations of  $\gamma$  using measured magnetic parameters are in reasonable agreement with those observed except for the Gd compound. It is suggested that in this case the Bodenberger and Hubert model may not be valid. Changes of domain patterns have been observed throughout a complete hysteresis cycle. Examples for  $Nd_2Fe_{14}B$  are shown and the relevance of these observations to the behaviour of magnets made from this material is discussed. (Author abstract) 13 refs.

**089088 MAGNETIC AND CRYSTALLOGRAPHIC PROPERTIES OF TERNARY RARE-EARTH COMPOUNDS OF THE TYPE  $R_2Fe_{14}C$ .** Ternary tetragonal compounds of the composition  $R_2Fe_{14}C$  were observed for  $R=Nd, Sm, Gd, Tb, Dy, Ho, Er, Tm$  and  $Lu$ . The lattice constants of these compounds were determined. Also determined were the magnetic properties, comprising the temperature dependence of the magnetization in the range 4.2–700 K and the field dependence of the magnetization at 4.2 K in fields up to 35 T. These latter measurements were made on magnetically-aligned powders with the field parallel and perpendicular to the alignment direction, making it possible to determine the anisotropy fields. The magnetocrystalline anisotropy, consisting of contributions due to the Fe and rare-earth sublattice, was found to be of comparable magnitude in  $R_2Fe_{14}C$  and  $R_2Fe_{14}B$ . (Author abstract) 15 refs.

**089089 MAGNETIC STRUCTURE AND PROPERTIES OF EQUIATOMIC RARE EARTH GERMANIDES.** Magnetic measurements were made on the compounds  $EuGe$ ,  $DyGe$  and  $TmGe$ . The first two compounds order antiferromagnetically at 20 K and 37 K respectively. For  $TmGe$  antiferromagnetic ordering is observed below 4.2 K. The magnetic structure of orthorhombic  $DyGe$  was investigated by neutron diffraction and shown to be antiferromagnetic with propagation vector  $k=[00\frac{1}{2}]$ . The magnetic properties of all RGe compounds ( $R$ =rare earth metal) are reviewed. It is shown that the magnetic coupling constant changes from positive to negative as the RGe series is passed through. (Author abstract) 15 refs.

**089092 STRUCTURE AND MAGNETIC PROPERTIES OF THE  $LaCo_5P_5$ -TYPE COMPOUNDS  $PrCo_5P_5$  AND  $EuCo_5P_5$ .** The new compounds  $PrCo_5P_5$  and  $EuCo_5P_5$  were prepared by reaction of the elemental components in a tin flux. They crystallize with the  $LaCo_5P_5$ -type structure, which was refined for  $EuCo_5P_5$  from single-crystal X-ray diffractometer data to a residual of  $R=0.028$  for 4881 structure factors and 48 variable parameters.  $LaCo_5P_5$  is Pauli paramagnetic.  $PrCo_5P_5$  and

$EuCo_5P_5$  exhibit Curie-Weiss behavior with magnetic moments corresponding to those of  $Pr^{3+}$  and  $Eu^{2+}$  and paramagnetic Curie temperatures  $\theta$  of 20 K and 6 K respectively. (Edited author abstract) 17 refs.

Rechuis, M. (Univ Muenster, Muenster, West Ger); Jeitschko, W.; Moersen, E.; Mueller-Warmuth, W. *J Less Common Met* v 139 n 2 May 1988 p 359-369.

**089093 CRYSTALLINE ELECTRIC FIELD EFFECTS IN THE MAGNETIC PROPERTIES OF HEXAGONAL PRASEODYMIUM COMPOUNDS.** The high field magnetization and the magnetic susceptibility of hexagonal praseodymium compounds are calculated on the basis of a molecular field Hamiltonian, including the CEF potential, a Zeeman term, and isotropic exchange interactions. At low temperatures it is shown that the full magnetic moment of the  $Pr^{3+}$  ion is always reached in a stepwise manner for a magnetic field applied along the c-axis. Perpendicular to the c-axis this occurs only in the case of a  $\Gamma_4$  ground state. This is a pure CEF effect, resulting from the crossing of the ground state by an excited state with a higher magnetic moment. The temperature dependence of the magnetic susceptibility would have a maximum corresponding to an appreciable population of an excited state with a greater magnetic moment. Some hexagonal Pr compounds are considered in which the discussed effects are or should be observable. (Author abstract) 13 refs.

**089094 EFFECT OF SUBSTITUTION OF Al AND Mo ON THE MAGNETIC PROPERTIES OF  $R_2Fe_{12-x}T_xCo_2B$  ( $R$ = SYNTHETIC MISCHMETAL, DIDYMIUM AND NEODYMIUM).** Effect of a small amount of Al and Mo on the crystallographic and magnetic properties of Co-doped  $R_2Fe_{14}B$  has been studied on the  $MM_2Fe_{12-x}T_xCo_2B$  and Didymium  $Fe_{12-x}T_xCo_2B$  systems. All of the alloys studied crystallize in the tetragonal  $Nd_2Fe_{14}B$  structure. The unit cell volume is found to decrease by substituting iron by aluminum and increase when iron is replaced by molybdenum. All the substitutions performed result in an increase of the anisotropy field. The Curie temperatures and saturation moments decrease. For example, in Didymium  $Fe_{12-x}T_xCo_2B$  at room temperature,  $H_A=89$  kOe,  $M_s=31.4 \mu_B$  and  $T_C=701$  K. (Author abstract). 3 Refs.

**089095 SINGLE-CRYSTAL MAGNETIC SUSCEPTIBILITY AND CRYSTAL-FIELD INVESTIGATION OF TERBIUM PHOSPHATE IN THE TETRAGONAL PHASE.** The dc magnetic susceptibility of  $TbPO_4$  in the tetragonal phase has been measured from room down to liquid nitrogen temperatures for external field orientations both perpendicular and parallel to the c-axis. A fairly good theoretical explanation of the magnetic behavior of  $Tb^{3+}$  in  $TbPO_4$  observed by us and other workers over a wide range of temperature (300–4 K) was obtained using the revised crystal field and taking the internal field through mean-field approach. The electronic heat capacity is computed which shows two Schottky anomalies one at approximately 10 K and the other at approximately 55 K in partial agreement with available experimental information. The interaction of the nuclear spin with the electric field gradient and the hyperfine magnetic field is studied; an anomaly in the nuclear heat capacity is located at approximately 70 mK. (Edited author abstract). 28 Refs.

Sen, Harabhusan (Burdwan Univ, West Bengal, India); Wanklyn, B.M.; Neogy, D. *J Magn Magn Mater* v 73 n 2 Jun 1988 p 221-228.

**089096 HIGH FIELD MAGNETIZATION OF  $R_2Fe_{14}B$  COMPOUNDS MEASURED UP TO 55 T.** Magnetic field induced spin reorientation was studied in  $R_2Fe_{14}B$  ( $R=Nd, Tm$  and  $Er$ ) single crystals up to 55 T

under pulsed high magnetic fields and also up to 23 T by means of a hybrid magnet. The incipient stage of the transition from ferri- to ferromagnetism was clearly observed in the magnetization curve along the [100] and [110] directions in  $Er_2Fe_{14}B$  and  $Tm_2Fe_{14}B$  crystals. The transition fields were roughly estimated to be 70 T and 55 T along the [100] direction for Er and Tm compounds, respectively. The forced spin reorientation transition was measured in  $Nd_2Fe_{14}B$  crystal along the [100] direction at various temperatures. A steep increase of magnetization appeared at 200 K with decreasing temperature. The magnetization processes were also measured along several directions within the c-plane. When the field direction approached [110], the distinct transition diminished. 11 refs.

**089097 IMPROVEMENT IN MAGNETIC PROPERTIES OF  $(Sm, Pr)Co_{4.6}$  ALLOYS BY A CCIA TREATMENT.** A CCIA (controlled cooling and isothermal aging) treatment was adopted to check the reproducibility problem of  $(Sm, Pr)Co_{4.6}$  presented by M. Velicescu (1982) and to improve the magnetic properties of  $(Pr_xSm_{1-x})Co_{4.6}$  alloys. It was shown that controlled cooling rate between sintering and isothermal aging temperatures profoundly affects the scattering of magnetic property data. By this CCIA treatment the composite  $(Sm, Pr)Co_{4.6}$  alloy was shown to preserve merits of both  $SmCo_5$  and  $PrCo_5$  alloys. 9 refs.

**089098 STRUCTURAL AND MAGNETIC PROPERTIES OF  $R_2Fe_{14}BH_x$ .** The properties of  $R_2Fe_{14}B$ -series high-performance permanent magnets are shown to have basic characteristics very sensitive to hydrogen absorption. The cell parameters, Curie temperature, magnetization, anisotropy constants, and coercivity vary nonlinearly with the hydrogen content. Moreover, it is shown how hydrogen absorption can be used as a tool to obtain a better understanding of the possible mechanisms that drive the spin reorientation phenomena. 24 refs.

Fruchart, D.; Pontonnier, L.; Vaillant, F.; Bartolome, J.; Fernandez, J.M.; Puertolas, J.A.; Rillo, C.; Regnard, J.R.; Yaouanc, A.; Fruchart, R.; Heritier, P.L. *IEEE Trans Magn* v 24 n 2 Mar 1988, EMMA '87: Eur Magn Mater Appl Conf, Salford, Engl, Sep 14-16 1987 p 1641-1643.

**089099 MICROSTRUCTURE AND MAGNETIC PROPERTIES OF  $Tb-Dy-Fe_{1.9}$ .** Materials of the composition  $Tb_xDy_{1-x}Fe_{1.9}$  ( $x=0.27, 0.3$ , and  $0.5$ ), have been prepared by a contained float-zone growth technique. These materials have been found to exhibit magnetostrictive strains greater than 1000 microstrain with magnetomechanical coupling coefficients on the order of 0.6. Microstructural investigations have highlighted the complex relationship between the magnetic domain structure and the inherent defect structure of the materials. All alloys were prepared using sublimed-quality rare earth metals and spec-pure iron. Microstructure observations were carried out using both optical and electron microscopes. The strain measurements were made using conventional techniques. The measurement of the magnetomechanical coupling coefficient ( $k_{33}$ ) was carried out using a resonance method. 7 refs.

**089100 VARIATIONS IN TEMPERATURE COEFFICIENT OF ANISOTROPY AND COERCIVITY IN FINE PARTICLES OF Nd<sub>2</sub>Fe<sub>14</sub>B TYPE RECORDING MATERIALS THROUGH SUBSTITUTIONS.** A theoretical and experimental study is reported on how to modify the temperature dependence of coercivity,  $H_c(T)$ , in  $R_2Fe_{14}B$  type compounds ( $R$  = rare earth) through modifications of the temperature dependence of anisotropy field,  $H_A(T)$ . This is accomplished by partial substitutions on R sites. Experimentally it is found that for  $Y_2Fe_{14}B$  fine particles (approx. 1- $\mu$ m), values of  $H_c$  are in the range of 1 kOe. For these materials, a slightly positive  $H_c(T)$  is obtained near 300 K. Stable  $H_A(T)$  and  $H_c(T)$  near 300 K are obtained, e.g., with  $Nd_{0.2}Y_{0.8}Fe_{14}B$ , while strongly increasing  $H_A(T)$  and  $H_c(T)$  are obtained with small substitutions of Er for Y in  $Y_2Fe_{14}B$ . More complex  $H_A(T)$  and  $H_c(T)$  can be obtained in more complex systems. 7 refs.

**089101 MAGNETOCRYSTALLINE ANISOTROPY OF SOME  $R_2Fe_{14}B$ -BASED QUASITERMINARY COMPOUNDS.** A study is presented of the magnetocrystalline anisotropy of the quasiternary systems  $(Pr_{1-x}Er_x)_2Fe_{14}B$  and  $(Pr_{1-x}Sm_x)_2Fe_{14}B$  in which, with increasing  $x$ , the easy-magnetization direction changes from easy axis to easy plane. Magnetization measurements on samples aligned magnetically at room temperature have been carried out in fields up to 20 T at temperatures ranging from 4.2 K to room temperature. The data of the easy-axis compounds are analyzed in terms of the anisotropy constants up to sixth-order, taking into account the misalignment of the grains in the magnetically-aligned samples. Special emphasis is given to the influence of the Sm and Er substitutions on the first-order magnetization process and the anisotropy energy of  $Pr_2Fe_{14}B$ . 13 refs.

**089102 MAGNETIC INSTABILITIES IN THE RARE EARTH-3d COMPOUNDS.** Due to the evolution of the band structure through the series, the rare earth R-3d metal compounds form outstanding tools for the study of the 3d and/or 4f magnetic instabilities. Such instabilities are illustrated in this paper for three types of systems: i) the Y-Ni system with a special emphasis on the 'thermal spontaneous magnetization' observed in  $Y_2Ni_7$ ; ii) the R-Co system where 'collective electron metamagnetism' and Co antiferromagnetism are observed in the  $RCO_2$  (as in  $ThCo_2$ ), and in  $La_2Co_{1.7}$  and  $La_2Co_3$ , respectively; iii) the Ce-Ni system where the 4f instability is quite characteristic in the CeNi intermediate valence compound in which large magnetovolume effects were determined. **089109 Co QUASI-UNIDIMENSIONAL STAKING VERSUS MAGNETISM IN THE  $RCo_{1-x}E$  INTERMETALLIC ( $R$  = La, Pr, Nd).** The  $RCo_{1-x}E$  intermetallic compounds crystallize in a simple but original crystallographic structure characterized by a quasi-linear staking of the cobalt atoms. Using the property of the lanthanides contraction the coherence of the Co chains has been studied with La, Pr, Nd and some pseudobinary compounds. In connection with this peculiar crystallographic structure the Co magnetism in these  $RCo_{1-x}E$  compounds

has also been studied. While  $LaCo_{1-x}E$  exhibits a basal plane triangular anti-ferromagnetic structure under a Neel temperature of 146 K, a collinear ferromagnetic structure is observed in  $PrCo_{1-x}E$  and  $NdCo_{1-x}E$  with a Curie temperature of 142 and 202 K, respectively. Within a chain the arrangement of the Co moments is ferromagnetic in all the three compounds. The antiferromagnetism of  $LaCo_{1-x}E$  is explained through the strong hybridization between the Co 3d electrons and the La 5d electrons. (Edited author abstract)

## Measurements

**089118 MAGNETIC AFTEREFFECT IN RARE EARTH-IRON-BORON MAGNETS.** The temperature dependences of the aftereffect coefficient  $S_v$  and the coercive force  $iH_c$  have been measured from 4.2 K to 300 K on two specimens prepared from sintered magnets of  $Pr_8Y_7Fe_{77}B_8$  (sintered at 1060°C and 1100°C). The latter has higher maximum energy products. The  $S_v$  values of both have a maximum at 60 K and 150 K respectively. This is a new behavior which can not be explained by any theory proposed until now. 13 refs.

Shi, J. (Okayama Univ, Okayama, Jpn); Yamada, O.; Maruyama, H.; Sagawa, M.; Hirose, S. *IEEE Trans Magn* v MAG-23 n 5 Sep 1987, INTERMAG '87: Int Magn Conf, Tokyo, Jpn, Apr 14-17 1987 p 3122-3124.

**089119 HIGH FIELD AND TEMPERATURE DEPENDENT MAGNETISATION MEASUREMENTS ON SOME  $Re_2Co_{17}$  SINGLE CRYSTALS.** Single crystals of  $Pr_2Co_{17}$  and  $Nd_2Co_{17}$  have been grown using a tri-arc Czochralski method. High-field magnetization

measurements up to 35 T have been performed on  $Pr_2Co_{17}$  and  $Nd_2Co_{17}$  at 4.2 K. The experimental curves show very large anisotropy; for fields along the  $c$  axis in  $Pr_2Co_{17}$  and along the  $a$  axis in  $Nd_2Co_{17}$  the magnetization does not reach the saturation value within this field range. Furthermore, the hard axis shows in both compounds a nonzero spontaneous magnetization indicating a cone structure with cone angles of about 26° and 7° for  $Pr_2Co_{17}$  and  $Nd_2Co_{17}$ , respectively. Low-field (up to 6 T) temperature-dependent magnetization measurements (4.2-300 K) show that in both compounds the cone angle remains visible up to 300 K, but for  $Pr_2Co_{17}$  the cone angle is drastically reduced above 150 K. These two  $RE_2TM_{17}$  compounds ( $RE$  stands for a rare-earth metal and  $TM$  stands for a transition metal) with a cone structure are compared with other  $RE-TM$  compounds with a cone structure. 11 refs.

## Microscopic Examination See Also NEODYMIUM COMPOUNDS—Microscopic Examination.

**089120 DISORDERED INTERMEDIATE STAGE IN THE REDUCTION OF  $Tb_{11}O_{20}$  OR  $Tb_2O_{12}$  TO C-TYPE  $Tb_2O_3$  IN THE ELECTRON MICROSCOPE.** A thin crystal of  $Tb_{11}O_{20}$  with a patch of  $Tb_2O_{12}$  has been observed to reduce in the high-resolution electron microscope to  $Tb_2O_3$  (C-type). In both cases the reduction occurred through a disordered intermediate stage which was of fluorite structure. The  $Tb_2O_3$  was observed to grow into this disordered region in patches previously termed cooperative emergence in a nucleation controlled ordering process. Whereas transformation (reaction) between  $Tb_{11}O_{20}$  and  $Tb_2O_{12}$ , for example, would be expected to be cooperative and displacive, the transformation to a C-type structure would be reconstructive and, thus, the intermediate stage of disorder is not unexpected. (Edited author abstract). 5 refs.

Bouletix, Claude (Arizona State Univ, Tempe, AZ, USA); Eyring, Leroy. *J Solid State Chem* v 75 n 2 Aug 1988 p 291-295.

**089121 OPTICAL OBSERVATION OF CLOSURE DOMAINS IN TERFENOL-D SINGLE CRYSTALS.** Optical differential interference contrast microscopy is used to observe the topological features in surfaces of single crystal Terfenol-D ( $Tb_{0.3}Dy_{0.7}Fe_{1.95}$ ) which arise from macroscopic lattice tilts due to the magnetostrictive strain between neighboring magnetic domains at the surface. The domain configurations observed can all be interpreted as being composed of low-energy 71° and 109° walls which have components of magnetization normal to the surface. Domain widths on the order of 2  $\mu$ m can readily be resolved. Observations from surfaces polished parallel to (110) and (112) are presented as a function of temperature, between 250 K and 350 K, and as a function of magnetic field applied parallel to the specimen surface. 10 refs.

**089122 MICROSTRUCTURAL CHARACTERISATION OF TERNARY RARE EARTH-IRON ALLOYS.** The microstructures of ternary alloy compositions based on the highly magnetostrictive  $(Tb,Dy)Fe_2$  compounds have been investigated by SEM (scanning electron microscope) metallography. The influence of preparation route and heat treatment on the prevailing microstructure has been examined. As-cast and annealed induction melted material have both been examined as a function of iron composition. Lattice parameter variations with composition and heat treatment have been observed. The detailed microstructures have been characterized by BSE imaging, X-ray microanalysis, and electron microprobe

analysis. Interpretation of the results has led to the suggestion of a modified phase diagram in the region of the Laves phase compound. 7 refs.

## Microstructure

**089123 NEW PHASES OF ERBIUM OXIDES.** Two new polymorphic erbium oxides have been found in small grains of nanophase ceramics by means of electron microscopy; one has a face-centered cubic (fcc) structure with lattice parameter  $a=0.374$  nm, the other has a monoclinic structure with  $a=0.359$  nm,  $b=0.562$  nm,  $c=0.344$  nm and  $\beta=119.3^\circ$ . The formation of these oxides is also discussed. (Author abstract). 14 Refs.

## Optical Properties See Also LASERS, SOLID STATE—Materials; TELLURIUM COMPOUNDS—Optical Properties.

**089124 LUMINESCENCE PROPERTIES OF  $Eu^{3+}$  AND  $Tb^{3+}$  IN  $Ln_2O_4X$  OXYHALIDES ( $Ln=X$ : Y-Cl, Y-Br, Gd-Br).** The luminescence properties of  $Eu^{3+}$  and  $Tb^{3+}$  in  $Y_2O_4Cl$ ,  $Y_2O_4Br$ , and  $Gd_2O_4Br$ , a family of oxyhalides with high chemical stability, have been investigated. The emission results from rare earth ions lying in two different sites. Spectral distributions and efficiencies are compared to those of the related  $Eu^{3+}$  or  $Tb^{3+}$  doped  $LnOx$  compounds. The efficiency is of the same order of magnitude for UV excitation into the  $Eu^{3+}$  charge transfer or  $Tb^{3+}$  5d bands, but much lower for excitation through the host lattice (i.e., by x-ray or electron beam). (Author abstract).

Es-Sakhi, B. (Univ de Bordeaux, Talence, Fr); Guillen, F.; Garcia, A.; Fouassier, C.; Hagenmuller, P. *J Electrochem Soc* v 135 n 8 Aug 1988 p 2099-2102.

**089125 INVESTIGATION OF LUMINESCENT  $Eu$ -DOPED SESQUIOXIDES  $Ln_2O_3$  ( $Ln = In, Sc, Y, La, Gd, Lu$ ) AND SOME MIXED OXIDES BY  $^{151}Eu$  MOESSBAUER SPECTROSCOPY.** Luminescent  $Eu$ -doped sesquioxides  $Ln_2O_3$  ( $Ln = In, Sc, Y, La, Gd, Lu$ ) and some mixed oxides have been investigated with  $^{151}Eu$  Moessbauer spectroscopy. The spectra are interpreted by using crystallographic and luminescence data. Effects of  $Eu$  concentration, substitution and crystal structure on the isomer shift are discussed in terms of  $Eu-O$  distance, coordination number and covalency. For the compounds with the cubic modification, no preferential site occupation by  $Eu^{3+}$  ions on the two available crystallographic sites can be concluded. (Author abstract). 23 Refs.

## Phase Diagrams See Also SUPERCONDUCTING MATERIALS—Magnetic Properties.

**089126 MAGNETIC PHASE DIAGRAM OF  $Ho_{1-x}Ge_1-xSi_x$  STUDIED BY NEUTRON DIFFRACTION AND MAGNETIC MEASUREMENTS.** Several samples ( $0.2 \leq x \leq 1.0$ ) of  $HoGe_{1-x}Si_x$  (CrB type) were studied over an extensive temperature range by neutron diffraction. The relative stability of the two existing magnetic structures with wave vectors depends on both the temperature and composition. The corresponding stability regions are shown in a magnetic phase diagram. The Neel temperature  $T_N$  and the transition temperature  $T_{IC}$  between the lock-in structure and the incommensurate structure increase with silicon content. The magnetic moments of  $Ho$  are confined to a direction close to the  $c$ -axis ( $5-7^\circ$ ) over the whole temperature range and order with a pure sinus modulation between  $T_{IC}$  and  $T_N$ . (Edited author abstract) 12 refs.

**089128 RESISTIVE BEHAVIOUR OF  $\text{PrH}_{2+x}$  COMPOUNDS AT THE APPROACH OF THE METAL-INSULATOR TRANSITION.** Electrical measurements for  $\text{PrH}_{2+x}$  compounds with  $0 \leq x \leq 0.75$  show a metallic behavior below room temperature. There is strong evidence in favor of structural ordering (short range for  $x < 0.1$  and long range for  $x > 0.2$ ) within the H sublattice for all concentrations  $x$ . A qualitative analysis of the phonon resistivity and of the disorder resistivity implies a strong reduction in the carrier density with increasing  $x$ ; this places this system near to a metal-insulator transition as in  $\text{CeH}_{2+x}$  and  $\text{LaH}_{2+x}$ . We observe also that the mobility of the H atoms increases with increasing  $x$ . (Author abstract). 23 Refs.

**089132 QUASI-PARTICLE ENERGY OF 4f-STATES IN RARE SYSTEMS: WEAK CORRELATION REGIME.** We have calculated the quasi-particle energy for the localized 4f-rare earth states, described in the Ramirez-Falicov-Kimball (RFK) model. The Coulomb correlation between the f-localized states and d-iten-

erant states is considered in the weak correlation regime, beyond the usual Hartree-Fock approximation. It is found that, for reasonable values of the parameters of the model, one can obtain a bimodal structure for the f-f Green's function. (Author abstract) 15 refs.

Troper, A. (Cent Brasileiro de Pesquisas Fisicas, Rio de Janeiro, Braz); da Cunha Lima, I.C. *Solid State Commun* v 61 n 3 Jan 1987 p 195-198.

**089133 CRYSTAL FIELD AND MAGNETIC MOMENTS OF RARE-EARTH IONS IN  $\text{REBa}_2\text{Cu}_3\text{O}_{7-x}$  ( $\text{RE} = \text{Ce}, \dots, \text{Yb}$ ).** The superposition model is used to predict the values of the fourth- and sixth-order crystal-field parameters and consequently also the nature of magnetic moments of rare-earth ions in superconducting orthorhombic phase of  $\text{REBa}_2\text{Cu}_3\text{O}_{7-x}$  ( $\text{RE} = \text{Ce}, \dots, \text{Yb}$ ). A similarity between the coordination dodecahedra of rare-earth ions in  $\text{REBa}_2\text{Cu}_3\text{O}_{7-x}$  and garnets is used. The low-temperature magnetic moments of rare-earth ions are anisotropic and partially quenched. The quantitative conclusions are in general hampered by strong dependence of the magnetic moments on the crystal-field parameters of second order. As the superposition model gives no useful prediction for these parameters, it will be necessary to determine them by fitting to suitable experimental data. (Author abstract) 13 refs.

## Production

**089135 LITHIATED RARE-EARTH THIOSPINELS AND SELENOSPINELS.** The spinels  $\text{A}[\text{Ln}_2]\text{X}_4$  with  $\text{A} = \text{Cd}$  or  $\text{Mg}$  and  $\text{X} = \text{S}$  or  $\text{Se}$  were prepared for  $\text{Ln} = \text{Ho}, \text{Er}, \text{Tm}, \text{Yb}$ , and  $\text{Y}_{2-x}\text{Yb}_x$  ( $x = 0.0, 1.0, \text{or } 2.0$ ). Lithiation with n-butyllithium was attempted in the hope of obtaining both mixed-valent and intermediate-valent compounds as well as a continuous variation of the Fermi energy from below to within a localized  $4f^n$  configuration. Formation of the mixed-valent compounds  $\text{Li}_x\text{Mg}[\text{Yb}_{2-x}^{3+}\text{Yb}_x^{2+}]\text{X}_4$ ,  $\text{X} = \text{S}$  or  $\text{Se}$ , with the spinel  $[\text{Yb}_2]\text{X}_4$  framework was accomplished, but lithium displaced cadmium from the cadmium spinels and magnesium from  $\text{Mg}[\text{Tm}_2]\text{Se}_4$ , which frustrated attempts to obtain an intermediate-valent compound of variable electron/atom ratio. (Author abstract) 11 refs.

De La Mora, Pablo (Inorganic Chemistry Lab, Oxford, Engl); Goodenough, John B. *J Solid State Chem* v 70 n 1 Sep 1987 p 121-128.

## Reduction

**089136 REDUCTION OF PRASEODYMIUM AND TERBIUM HIGHER OXIDES: CHEMICAL REACTIONS SIMILAR TO DIFFUSIONLESS PHASE TRANSITIONS.** Some solid state chemical reactions such as a change in the degree of oxidation can occur without a great displacement of the atomic positions of one kind of atom in a structure. When praseodymium and terbium oxides are reduced, the rare earth atom movement is less than the cation crystallographic distances in the fluorite-related structure. This means that the chemical transformation occurs without a great change in the

framework of one kind of atom. The relative positions of these atoms are nevertheless slightly modified as in a diffusionless phase transition. In the Pr and Tb oxides the deformation changes both the volume and the shape of the structural unit. A displacement tensor can be defined for these chemical transformations. (Edited author abstract) 9 refs.

**Specific Heat** See Also CRYOGENICS.

**089138 HEAT CAPACITIES OF LAVES PHASE COMPOUNDS  $\text{RMn}_2$  ( $\text{R} = \text{Y}, \text{Gd}$  AND  $\text{Er}$ ).** Measurements of heat capacity indicate that the Mn moment in  $\text{YMn}_2$  has an itinerant character and an additional  $C_M$  is observable even above  $T_N$ . In  $\text{GdMn}_2$ , the Gd moments are in disorder at  $T_N$  simultaneously with the Mn moments. The CEF contributions in  $\text{ErMn}_2$  are observed and are calculated using a single-ion Hamiltonian. (Author abstract) 6 refs.

Okamoto, T. (Hiroshima Univ, Hiroshima, Jpn); Nagata, H.; Fujii, H.; Makihara, Y. *J Magn Mater* v 70 n 1-3 Dec 1 1987, Proc of the Int Symp on Magn of Intermet Compd, Kyoto, Jpn, Apr 20-22 1987 p 139-141.

**089139 SPECIFIC HEAT MEASUREMENTS OF  $(\text{Ho}, \text{YCo}_2)$  AND  $(\text{Dy}, \text{YCo}_2)$ .** We report on concentration- and temperature-dependent specific heat measurements of  $(\text{Dy}_x\text{Y}_{1-x})\text{Co}_2$  in the temperature range from 1.5 to 60 K in comparison with recent results of  $(\text{Ho}_x\text{Y}_{1-x})\text{Co}_2$ . The magnetic contribution to the specific heat,  $C_m$ , is analysed with regard to the appearance of spin-fluctuations and in terms of spin-glass phenomena. The loss of magnetic entropy in the dilute RE-concentration range indicates presumably an instability of the RE-moments. (Author abstract) 9 refs.

Pillmayr, N. (Technical Univ Vienna, Austria); Schmitzer, C.; Gratz, E.; Hilscher, G.; Sechovsky, V. *J Magn Mater* v 70 n 1-3 Dec 1 1987, Proc of the Int Symp on Magn of Intermet Compd, Kyoto, Jpn, Apr 20-22 1987 p 162-164.

**Spectroscopic Analysis** See Also MAGNETIC MATERIALS—Spectroscopic Analysis; OXIDES—Reduction.

**089140 SPECTRA AND STRUCTURE OF BORATOTUNGSTATES (MOLYBDATES) OF EUROPIUM-ACTIVATED LANTHANIDES.** The luminescence and excitation spectra, and also the IR absorption spectra of compounds with mixed anions - boratotungstates (molybdates) and certain tungstates and molybdates were investigated. The spectroscopic features of the structure of the compounds were revealed. In particular, it is shown that the high intensity of the low-frequency

electronic-vibrational bands is a characteristic feature of chain-type borate anions. The special features of the structure of the compounds  $\text{Ln}_2\text{O}_9\text{EuO}_9$  were determined. It is shown that their structure is not chain-type. The crystal lattice of these compounds is constructed out of distorted plane trigonal borate and  $\text{WO}_6^{6-}$  anions. The structure is distinguished by disorder. The symmetry of the luminescence centers is no higher than  $C_{2v}$ . In Russian. 12 refs.

**089141 SPECTRAL DETERMINATION OF THE 'CERAMIC' IMPURITIES IN EUROPIUM, GADOLINIUM, AND DYSPROSIUM OXIDES.** Extension of the application of rare-earth element (REE) oxides as structural materials and coating assumes the utilization of ceramic technology such as briquetting, firing, grinding, etc. Material contamination by the so-called 'ceramic' impurities ( $\text{SiO}_2$ ,  $\text{MgO}$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$ , et al.) inevitably occurs here. Methods for the spectral determination of  $\text{Al}_2\text{O}_3$ ,  $\text{SiO}_2$  and  $\text{Fe}_2\text{O}_3$  impurities in Eu, Gd, and Dy oxides in the interval 0.03-0.4% and the MgO impurity within 0.5-1.5% limits are elucidated in this paper (magnesium oxide is used as a sintering initiator). Because of the absence of appropriate standard specimens, the calibration graphs are obtained by using synthetic mixtures prepared from highly pure oxides by mechanical mixing. 6 refs.

Alapin, B.G. (Ukrainian Scientific-Research Inst of Refractories, Khar'kov, USSR); Terletskaia, N.K. *Ind Lab (USSR)* v 53 n 4 Apr 1987 p 328-329.

**089142 LUMINESCENCE OF CERIUM (3+) ACTIVATED RARE EARTH SILICOPHOSPHATES.** Rare earth silicophosphates with a general formula  $\text{RE}_2\text{O}_3 \cdot 0.10\text{SiO}_2 \cdot 0.95\text{P}_2\text{O}_5$  (RE represents La or Gd and these formula are simplified as LSP or GSP respectively) were synthesized and developed as good host materials for making phosphors. A systematic investigations on the luminescence properties of  $\text{Ce}^{3+}$ -activated silicophosphates of lanthanum and gadolinium are reported. 3 refs.

## Stability

**089147 ESTIMATION OF THERMAL-STABILITY CHARACTERISTICS OF RARE-EARTH ELEMENT NIOBATES IN THE HIGH-TEMPERATURE REGION.** The thermal stability of a series of REE niobates at the melting point were calculated from phase diagrams of the REE oxide-niobium oxide system by the method of thermodynamic analysis using the model of ideal associated solutions. The effect of temperature and composition on the degree of thermal dissociation of niobates was shown. A correlation was established but with the characteristics of thermal stability and electric conductivity of REE orthoniobates in the high-temperature region. The degree of donor-acceptor interaction of REE and niobium oxides in the compounds was determined by the method of notching of electro-negativities, and the correspondence of its values with the thermal stability of niobates was shown. (Author abstract) 9 refs.

**089151 STRUCTURE AND  $^{57}\text{Fe}$  MOSSBAUER EFFECT IN  $\text{R}_2\text{Fe}_{14}\text{C}$  COMPOUNDS.** The crystal structure of the ternary compound  $\text{Lu}_2\text{Fe}_{14}\text{C}$  was determined and shown to be isotypic with  $\text{Nd}_2\text{Fe}_{14}\text{C}$ .  $^{57}\text{Fe}$  Mossbauer spectra were taken of the compounds  $\text{Lu}_2\text{Fe}_{14}\text{C}$  and  $\text{Gd}_2\text{Fe}_{14}\text{C}$  at 300 K and 10 K. Analysis of the spectra showed that the average iron moment in  $\text{R}_2\text{Fe}_{14}\text{C}$  is approximately the same as in  $\text{R}_2\text{Fe}_{14}\text{B}$ . The Mossbauer spectra were decomposed into six subspectra according to the six different iron sites in  $\text{R}_2\text{Fe}_{14}\text{C}$ . There are considerable differences in the sizes of the iron moments associated with the six iron sites. (Author abstract) 12 refs.

**089152 STRUCTURAL AND PHOTOLUMINESCENT PROPERTIES OF FULLY-HYDRATED LANTHANON URANYL PHOSPHATES.** A re-investigation of the lamellar lanthanon derivatives of hydrogen uranyl phosphate ( $\text{HUO}_2\text{PO}_4 \cdot 4\text{H}_2\text{O}$  (HUP)) is reported. When prepared from both HUP and n-butylammonium uranyl phosphate ( $\text{n-C}_4\text{H}_9\text{NH}_3\text{UO}_2\text{PO}_4 \cdot 3\text{H}_2\text{O}$  (BAUP)) the fully-hydrated LnUP compounds have the approximate composition  $\text{Ln}_{1/3}\text{UO}_2\text{PO}_4 \cdot x\text{H}_2\text{O}$  ( $\text{Ln} = \text{La}, \text{Ce}, \text{Pr}, \text{Nd}, \text{Eu}, \text{Gd}, \text{Tb}, \text{Dy}, \text{Yb}$ ;  $x = 3.7-4$ ). Interlamellar spacings parallel the trend in lanthanon size and range from 11.1 Å for the lanthanum derivative to 10.7 Å for the ytterbium compound; these distances decrease by 2.5-2.8 Å if the LnUP compounds are air dried. With the exception of cerium, praseodymium, neodymium and europium derivatives, which are only weakly emissive, the other LnUP samples emit efficiently at 295 K when excited with blue or near-UV light. (Edited author abstract) 10 refs.

**089153 DETERMINATION STRUCTURALE DE LA FORME DE HAUTE TEMPERATURE DU COMPOSE  $\text{La}_4[\text{Ge}_3\text{O}_{10}][\text{GeO}_4]$ : ANALYSE COMPARATIVE DES STRUCTURES TRICLINIQUES DES GERMANATES DE TERRES RARES DE FORMULE GLOBALE  $\text{Ln}_2\text{Ge}_2\text{O}_7$ .** [Structural Determination of the High-Temperature Phase of Compound  $\text{La}_4[\text{Ge}_3\text{O}_{10}][\text{GeO}_4]$ : Comparative Analysis of the Triclinic Structures of Rare Earth Germanates of the Form  $\text{Ln}_2\text{Ge}_2\text{O}_7$ ]. The rare-earth germanates  $\text{Ln}_2\text{Ge}_2\text{O}_7$  have been structurally determined as three triclinic structural forms ( $\text{Ln} = \text{La-Gd}$ ) and one tetragonal ( $\text{Ln} = \text{Gd-Lu}$ ). The structural determination of the high temperature form  $\text{La}_2\text{Ge}_2\text{O}_7$ , which is presented here, gives rise to a fourth triclinic structural type. The complete description of the  $\text{Ln}_2\text{Ge}_2\text{O}_7$  phases, stable at ordinary pressure, is thus achieved. Refinement was carried out by the heavy atom method on a model which could be elaborated after the comparative study of the three triclinic forms. (Edited author abstract) 21 refs. In French.

**089154 FORMATION AND LUMINESCENCE OF LOWER SYMMETRICAL TELLURITE ANTI-GLASS PHASES.** Two series of nonstoichiometric lanthanoid tellurite phases have been identified which are similar to cubic ( $\text{Ln}_2\text{TeO}_6$ ) anti-glass phases with  $\text{CaF}_2$  defect structure. Their X-ray diagrams indicate low-symmetrical  $\text{CaF}_2$  superstructures. Monoclinic (or pseudotetragonal) subcells were determined. Antilattice disorder is consistent with the  $\text{Eu}^{2+}$  and  $\text{Te}^{4+}$  luminescence of one series, but can be excluded for the other one. (Author abstract) 23 refs.

**Synthesis** See Also MAGNETIC MATERIALS—Antiferromagnetism.

**089156 SYNTHESIS AND PHASE EQUILIBRIA OF OXIDE COMPOUNDS AND SOLID SOLUTIONS BASED ON RARE EARTH OXIDES.** The formation and phase stability of the intermediate compounds and solid solutions in binary systems  $\text{R}_2\text{O}_3$ -other oxides ( $\text{R} = \text{Rare earth}$ ) are discussed with regard to ionic scale parameter of field strength, lattice energy and site self-potentials in sublattices. The intermediate compounds and their phase relations are summarized in the systems  $\text{R}_2\text{O}_3$ - $\text{WO}_3$ . Equilibrium phase diagrams for  $\text{La}_2\text{O}_3$ ,  $\text{Nd}_2\text{O}_3$  and  $\text{Y}_2\text{O}_3$  are revised from previously reported ones. In fluorite-related phases of  $\text{R}_3\text{TaO}_7$ , the smaller R ions led to the formation of the more disordered and higher symmetric phases. The phase diagrams of the solid solutions in the system  $\text{ZrO}_2$ - $\text{CeO}_2$  or  $\text{Y}_2\text{O}_3$  are also reviewed from the point of view of stable and metastable equilibria. The metastability seems to be caused by slow diffusion of cation and fast diffusion of anion and by martensitic phase transformation in the fluorite-related phases. The formation and stability of the high valence state of cations in the B-site of the perovskite lattice  $\text{ABO}_3$  are explained by the contribution of deep site self-potential

at the B-site. (Edited author abstract) In Japanese. 44 refs.

Yoshimura, Masahiro. *J Jpn Soc Powder Powder Metall* v 34 n 9 Nov 1987 p 421-430.

**089157 EFFECT OF THE COOLING RATE ON THE PHASE COMPOSITION OF RARE-EARTH TITANATES.** For compounds of the types  $\text{Ln}_2\text{TiO}_5$  and  $\text{Ln}_2\text{Ti}_2\text{O}_7$  ( $\text{Ln} = \text{La-Lu, Y, Sc}$ ) with a decrease in the ionic radius of the lanthanide and an increase in the quenching rate a tendency toward the formation of a more highly symmetrical structure is noted, which is in keeping with the behavior of these compounds in the equilibrium state. The use of 'ultraprapid' quenching broadened the range of existence of the fluorite-type cubic structure to  $\text{Ti}_2\text{TiO}_5$  and that of pyrochlore to  $\text{Sm}_2\text{Ti}_2\text{O}_7$ . 'Ultraprapid' quenching of compounds of composition  $\text{Ln}_4\text{Ti}_9\text{O}_{24}$  led to a transition to the amorphous state, which is apparently attributable to the nearness of the compositions of these phases to the eutectic points, for which there is a well-known tendency to glass formation due to the high viscosity. As in metal systems, at high cooling rates suppression of peritectic reactions and the formation of single-phase samples occurred. 8 refs. In Russian.

## Thermal Properties

**089160 ANOMALOUS STRONG DIVERGENCE OF THE SPECIFIC HEAT OF  $\text{ErIn}_3$  AT THE ANTIFERROMAGNETIC TRANSITION.**  $\text{ErIn}_3$  crystallizes in a cubic  $\text{AuCu}_3$ -type structure in which  $\text{Er}^{3+}$  ions form a simple cubic lattice. In this note we report the specific heat of  $\text{ErIn}_3$  near the antiferromagnetic transition. The measurements were performed on a single crystal (cubic shape, mass 170 mg) in magnetic field applied along the  $\langle 001 \rangle$  axis by using an adiabatic type calorimeter. Single crystals of  $\text{ErIn}_3$  were grown from the melt by the Bridgman method. The purity of the starting materials was 3N and 6N for erbium and indium, respectively. 21

## Thermodynamic Properties

**089161 THERMODYNAMIC CHARACTERISTICS OF LANTHANUM, PRASEODYMIUM, NEODYMIUM, AND GADOLINIUM MONOBISMUTHIDES.** Materials based on monobismuthides of rare-earth metals, including lanthanum, praseodymium, neodymium, and gadolinium, are promising for semiconductor technology and microelectronics. Information on the thermodynamic properties of these compounds is limited to calorimetric data on the enthalpies of formation and a qualitative description of the high-temperature behavior of praseodymium monobismuthide in vacuum. Investigation of the high-temperature behavior in vacuum by the Knudsen effusion method in combination with mass spectrometric, chemical, and x-ray diffraction analyses makes it possible to establish the composition of the vapor, the type of evaporation reaction, and the presence and extent of the area of homogeneity and to determine the partial pressure of the components of the vapor and calculate the enthalpy of the reaction and other thermodynamic characteristics. 8 refs.

## Thin Films

**089163 STUDY OF THE STABILITY OF Co-RICH  $\text{TbFeCo}$  THIN FILMS.** The effect of cobalt-content on the stability of  $\text{Tb}(\text{Fe}_{1-x}\text{Co}_x)$ , ( $x$  varying from 40 to 100%) thin films (about 100 nm thick) was investigated in relation to structural, chemical, and magnetooptic (MO) properties. Unprotected and  $\text{SiO}_2$ -protected films were prepared by electron-beam coevaporation, MO hysteresis loops were obtained with a polar Kerr-effect measurement system. Low-energy X-ray microprobe analysis and induced coupled plasma techniques were used for chemical analysis and structural properties were studied by transmission electron microscopy. Incubation tests were performed to follow the aging of the samples. Static electrochemical tests were carried out to determine their resistance to corrosion. An explanation of the results is proposed based on both oxygen species diffusion and structural modifications. 8 refs.

**089164 FILMS OF RARE EARTH OXIDES FORMED BY ELECTRON BEAM EVAPORATION.** Rare earth oxides can effectively be deposited by electron beam evaporation. The films thus formed are dense and non-porous and adhere to various metal substrates. The strength of the bond between the films and the substrates

is greatly affected by the treatment of the substrate prior to deposition (the substrate needs to be roughened). The structure of the films is affected to a small degree by the substrate condition and deposition parameters. The orientation of the films is dependent on the substrate temperature. The characteristics of erbium oxide and yttrium oxide films are presented. (Author abstract) 2 refs.

Adams, R.O. (Rockwell Int, Golden, CO, USA); Digital-lonardo, A.; Nordin, C.W. *Thin Solid Films* v 154 n 1-2 Nov 12 1987, Pap Presented at the Int Conf on Metall Coat - Part II, San Diego, CA, USA, Mar 23-27 1987 p 101-108.

## Wetting

**089165 INFLUENCE OF THE REACTION RATE OF METALLIC MELT WITH THE CATION OF THE SOLID PHASE ON THE WETTABILITY OF RARE-EARTH OXIDES.** The aim of this work was the investigation of the influence of the reaction rate of the melt with the cation of the oxide substratum on the wettability in oxide-metal systems. This problem was studied by comparing experimental data on the reaction contact and wettability by one metal of two oxides which were different both in the Gibbs energies for the formation of wetted oxides and the energies of reaction of metals of cations of oxides with the wetting metal. The authors studied the time and temperature relationships for the wetting of oxides of erbium  $\text{Er}_2\text{O}_3$  ( $-\Delta G^\circ(\text{f}1150^\circ\text{C}) = 1478 \text{ kJ/mole}$ ) and  $\text{Al}_2\text{O}_3$  ( $-\Delta G^\circ(\text{f}150^\circ\text{C}) = 1212 \text{ kJ/mole}$ ) with germanium. A study was made of the contact reaction in these systems and a comparison was made of the temperature dependence of wetting with the temperatures at which the reaction products are fixed. 7 refs.

## X-Ray Analysis See Also INTERMETALLICS—Magnetic Properties.

**089166 PREPARATION OF RARE-EARTH DISILICATES AND THEIR X-RAY DIFFRACTION STUDIES.** The aim of the present study was two-fold. Firstly, to establish the experimental conditions to get polymorphic rare-earth disilicates,  $\text{R}_2\text{Si}_2\text{O}_7$  (R = Er, Ho, Dy, Tb) by solid state reaction in the temperature range 1150 to 1500°C. Secondly, to study thermal transport properties of these rare-earth disilicates by a newly developed transient hot-strip method THS since, it is reported that THS method was successful for simultaneous measurement of thermal conductivity and thermal diffusivity of loose building materials like dune, sand, brick powder, cement etc. at room temperature and normal pressure. Since the chemical structures of rare-earth disilicates are reported to be complicated, it was therefore planned to study thermal properties of powdered samples. This letter describes only the preparation and identification of polymorphic rare-earth disilicates. 10 refs.

Maqsood, Asghari (Quaid-i-Azam Univ, Islamabad, Pak); Izhar-Ul-Haq. *J Mater Sci Lett* v 6 n 9 Sep 1987 p 1095-1097.

**089167 INVERSE PHOTOEMISSION SPECTRAL INTENSITY OF RARE-EARTH METALS.** The intensity of inhibited radiation of electrons arising during

radiation-induced trapping of an electron in free 4f-states of rare earth metals is examined. The intensity of emission as a function of electronic energy attains a maximum in the soft X-ray range. The intensity distribution of the transition is primarily governed by the localization radius of free 4f-states in the metals. (Author abstract) 11 refs.

Pavlychev, A.A. (Leningrad State Univ, USSR); Shulakov, A.S.; Kondrat'yeva, I.V. *Phys Met Metallogr* v 60 n 5 1985 p 62-66.

**089168 RESOURCES AND SEPARATION OF RARE EARTHS.** From 200 types of mineral containing rare earth elements, monazite, bastnaesite, xenotime and ion absorption ore are the most valuable. World reserves of rare earth minerals amount to 45 million tons of contained rare earth oxides (REO). China, with reserves of 36 million tons, accounts for 80% of total world reserves. To obtain high purity rare earth elements on an industrial scale, ion exchange and solvent extraction methods are explored. (Edited author abstract) In Japanese.

Akasi, Tsuneo. *J Jpn Soc Powder Powder Metall* v 34 n 9 Nov 1987 p 453-460.

**089169 GEOLOGICAL OCCURRENCE OF ELEMENTS CONSUMED IN THE ELECTRONICS INDUSTRY.** Although many elements are consumed in the electronics industry, the review is confined to silicon, the rare earths, gallium, germanium, selenium, tellurium and indium. The electronic metals show different crustal abundances. The associations of gallium with bauxite and of germanium, indium, selenium and tellurium with base-metal sulphide deposits - and their concentration within such deposits - indicate that they will continue to be recovered as by-products. Growth in demand and rising prices for these elements could stimulate increased recovery from existing operations and - in the case of germanium and gallium - initiate the search for independent sources. The resources of rare-earth elements are large in relation to current demand and the prospects for new discoveries are good. 27 refs.

## Analysis

**089170 MICELLAR SOLUBILIZING SPECTROPHOTOMETRIC DETERMINATION OF CERIUM GROUP OF RARE EARTH USING CHLOROPHOSPHONAZO-P-BENZOYL-GLYCINE.** The analytical property of the system RE-CPA-P-BG-CPB in the presence of alcohol have been studied. A blue complex is formed in  $0.16\text{--}0.32 \text{ mol/dm}^3$  HCl medium. Experiments show that the system is more sensitive and more selective than the system RE-CPA-P-BG for determining rare earths. The apparent molar absorption coefficient for cerium is  $1.65 \times 10^5 \text{ l.mol}^{-1}.\text{cm}^{-1}$  at 681nm. The method has been applied to the determination of cerium in synthetic magnesium alloys and cast aluminum with satisfactory results. (Edited author abstract) In Chinese. 1 ref.

Wang, Qiao-yun (Jiangxi Polytechnic Univ, China); Ouyang, Chong-xue; Luo, Run-xian; Yin, Zhen-zhou. *Xi You Jin Shu* v 6 n 1 Feb 1987 p 67-70.

**089171 DETERMINATION OF TRACE COPPER (II) IN RARE EARTH WITH METHOD OF CATALYTIC PHOTOMETRY.** A new analytical method of catalytic photometry based on the reaction of  $\text{H}_2\text{O}_2$  and arsenazo I using  $\text{Cu}^{2+}$  as catalyst and a,a'-dipyridyl as activator in a medium of  $\text{H}_2\text{SO}_4$  has been studied. A new method of determination of trace copper (II) has been established. Its sensitivity is  $4 \times 10^{-4} \mu\text{gCu}^{2+}/\text{cm}^3$ . The range of determination is from 0.01 to  $0.12 \mu\text{g Cu}^{2+}/25\text{cm}^3$ . The method was applied to determination of trace copper (II) in rare earths with satisfactory results. (Edited author abstract). 7 Refs. In Chinese.

Yin-Gou. *Xiyou Jinshu* v 7 n 1 Feb 1988 p 55-58.

## Applications See Also STEEL HEAT TREATMENT.

**089172 METALLURGICAL APPLICATIONS OF YTTRIUM AND THE LANTHANIDES.** Far from being scarce, the rare earth elements are prevalent in the earth's crust and common in diverse industrial applications. From their beginnings as lighter flints, lanthanide metals have progressed to applications in superconductors and hydrogen storage alloys. They are widely used in iron and steel production, and their physical properties are being exploited in high-strength permanent magnets and magneto-optic data recording. (Author abstract) 25 refs.

Kilbourn, Barry T. (Molycorp Inc, White Plains, NY, USA). *J Met* v 40 n 5 May 1988 p 22-25.

## Electric Conductivity

**089173 HIGH-TEMPERATURE ELECTRICAL RESISTIVITY OF RARE-EARTH METALS WITH VARIABLE VALENCE.** The electrical resistivity of compounds of rare-earth metals at high temperatures is calculated on the basis of allowance for the background mechanism of scattering and the hybridization of local electron states with the states of conduction electrons. An analytic expression is obtained for resistivity in a strong hybridization approximation. It follows from the expression that electrical resistivity may have a negative temperature coefficient within a broad range of high temperatures. The use of a three-band (s, d, f) model makes it possible to explain experimental data on the resistivity of certain rare-earth metals. (Edited author abstract) 7 refs.

Povzner, A.A. (Ural Wood Technology Inst, USSR); Abel'skii, Sh.Sh. *High Temp* v 24 n 6 Nov-Dec 1986 p 808-811.

## Electric Properties

**089174 CRYSTALLINE ELECTRIC FIELD EFFECTS IN DILUTE ALLOYS OF RARE EARTH METALS.** A theory is developed for interpreting the effects of the crystalline electric field in non-magnetic metals containing small quantities of magnetic rare earth impurities. The experimentally detected regularities in the behavior of the crystalline-electric-field-Hamiltonian parameters for various dilute alloys with heavy rare earth metals have been analyzed. Parameters of the model crystal potentials are determined for the non-magnetic metals magnesium, scandium, yttrium and lutetium. It can be concluded that the Friedel oscillations in the effective electrostatic interaction between the ions in the metals have observable consequences for the crystal-field parameters. (Author abstract) 19 refs.

Orlov, V.G. (I.V. Kurchatov Inst of Atomic Energy, Moscow, USSR); Jensen, J. *J Magn Magn Mater* v 71 n 3 Feb 1988 p 279-284.

## Electrolysis

**089175 STUDY ON THE PREPARATION OF RE-ALLOY BY FUSION ELECTROLYSIS.** A rare earth-aluminum alloy was prepared by codeposition in fusion electrolysis with molten cryolite as the electrolyte and  $\text{RE}_2\text{CO}_3$  and  $\text{Al}_2\text{O}_3$  as raw materials. The main advantage of this process are that Ce is easily maintained in the trivalent state. The  $\text{Ce}_2\text{O}_3$  derived from  $\text{RE}_2(\text{CO}_3)_3$  is dissolved out and its solubility in molten cryolite is high. Effects of molten salt composition and temperature on the electrolysis have been investigated. In Chinese. 18 refs.

## Electronic Properties

**089176 ELECTRONIC STRUCTURE OF THE RARE-EARTH IONS AS ANALYZED BY THE NEW FRAMES IN PHYSICS.** After a short introduction of

new concepts in physics, the electronic structure and its significance in material engineering are explained. The real shape of the classical orbits, an understandable description of self spin orbit coupling, and electronic multiplet structures of rare earth ions are presented. (Edited author abstract) In Japanese. 8 refs.

Iida, Shuichi. *J Jpn Soc Powder Metall* v 34 n 9 Nov 1987 p 481-484.

## Exploration

**089177 AVAILABILITY OF RARE EARTHS.** Bastnasite, the world's principle source of rare earths, is mined as a primary product in the United States and as a byproduct of iron-ore mining in China. Significant quantities of rare earths are also recovered from monazite, primarily a byproduct of heavy-mineral sands. Smaller quantities of rare earths, especially yttrium, are obtained from the yttrium-rich mineral xenotime. 16 refs.

## Extraction

**089178 USE OF CROWN ETHERS AS SYNERGISTS IN THE SOLVENT EXTRACTION OF TRIVALENT ACTINIDES AND LANTHANIDES BY 1-PHENYL-3-METHYL-4 TRIFLUOROACETYL PYRAZOLONE-5.** The synergistic extraction of trivalent Am, Cm, Cf and Eu with mixtures of 1-phenyl-3-methyl-4-trifluoroacetyl pyrazolone-5 (HPMTFP) and a crown ether dicyclohexano-18-crown-6 (DCH18C6) or monobenzo-15-crown-5 (B15C5) has been studied in chloroform. With DCH18C6 the synergistic species extracted are M(HPMTFP)<sub>3</sub> (HPMTFP)<sub>3</sub>(DCH18C6) where M = Am, Cm and Eu and Cf (PMPTFP)<sub>3</sub> (DCH18C6), whereas with B15C5 the species are M(HPMTFP)<sub>3</sub>n(B15C5), n being 1 or 2 for all these metal ions. The possibility of high coordination numbers for these metal ions in these systems and the probable reasons for the abnormal order of synergistic constants namely  $K_2 \gg B_1$  have been discussed. (Author abstract) 23 refs.

## Magnetic Properties

**089179 MAGNETIC AND CRYSTAL STRUCTURAL PROPERTIES OF NEW INTERMETALLIC COMPOUNDS IN R-Ti-Fe SYSTEM.** The magnetic and structural properties of R-Ti-Fe system were investigated. It was found that the Ti rich alloy includes a ternary compound having a ratio of R to Ti to Fe of 1:1:10 and a tetragonal structure. SmTiFe<sub>10</sub> has a high saturation magnetization and an anisotropy field with T<sub>C</sub> of 310°C. It is a candidate for a hard magnetic material. Fe replacement by Co in RTiFe<sub>10</sub> compounds increases the Curie temperature and the same ternary compound exists in R-Ti-Co systems. (Edited author abstract) In Japanese. 6 refs.

**Marketing** See SEMICONDUCTOR MATERIALS—Marketing.

## Microstructure

**089180 PHONON-ASSISTED STRUCTURAL TRANSITIONS IN A ONE-IMPURITY ANDERSON MODEL.** Impurity displacements in metallic systems have been investigated in relation to the phenomenon of valence fluctuations and structural transitions in rare earths. A one-impurity Anderson model has been employed which includes electron-phonon coupling in its hybridization term. Structural transitions were found to

increase the hybridization (i.e. the virtual bound state width) for average impurity displacements. Our results are compared with recent values for cerium metal and the agreement is reasonably good. (Edited author abstract) 10 refs.

Marin, F.P. (Univ Central de Venezuela, Caracas, Venez). *J Less Common Met* v 136 n 1 Dec 1987 p 1-7.

**089181 PHASE TRANSFORMATION IN THE RARE EARTH-COBALT ALLOYS.** The phase relationship and phase transformation in rare earth-cobalt (R-Co) alloys were investigated using a pair approximation. The structures of the alloys investigated were RCo<sub>5</sub> (CaCu<sub>5</sub> type), R<sub>2</sub>Co<sub>17</sub> (Th<sub>2</sub>Zn<sub>17</sub> type), and R<sub>2</sub>Co<sub>7</sub> (Gd<sub>2</sub>Co<sub>7</sub> type). It proposed that RCo<sub>5</sub> and R<sub>2</sub>Co<sub>17</sub> phases coexist stably with each other because the value of ordering energy depends on the distance between atoms. The phase separation of RCo<sub>5</sub> → RCo<sub>5</sub> + R<sub>2</sub>Co<sub>17</sub> in Sm-Co and Gd-Co alloys follows spinodally if ordering of the Th<sub>2</sub>Zn<sub>17</sub> type occurs. The composition of the eutectoid transformation RCo<sub>5</sub> → R<sub>2</sub>Co<sub>7</sub> + R<sub>2</sub>Co<sub>17</sub> shifts to the Co-rich side with decreasing ordering temperature and increasing eutectoid temperature. (Author abstract) 28 refs. In Japanese.

## Molten

**089182 ISOTHERMAL COMPRESSIBILITY AND SOUND VELOCITY OF LIQUID RARE EARTH METALS.** The simple one-component plasma (OCP) model has been applied to the isothermal compressibilities of liquid rare earth metals. The calculated results are in fair agreement with those estimated from the long-wavelength limit of liquid structure factors and the well-known relation between the isothermal compressibility and the surface tension. The velocity of sound has been calculated by the Percus-Yevick (PY) phonon model using recently measured low-angle structure data. The OCP model appears to provide a fair description of the thermodynamic properties of liquid rare earth metals. (Author abstract) 20 refs.

## Physical Properties

**089183 ANALYSIS OF DATA ON THE DENSITIES OF LIQUID RARE-EARTH METALS FROM THERMODYNAMIC PARAMETERS.** Calculations have been performed on the pseudopotential parameters and packing coefficients in a hard-sphere reference system for rare-earth metals near their melting points on the basis of minimum Helmholtz free energy if the calculated and observed values for the resistivity agree. The results have been used in calculating the thermodynamic parameters in the liquid state. Theory is in satisfactory agreement with experiment. A method is proposed for analyzing measurements on the temperature coefficient of the density, where there are sometimes substantial differences in the data. (Edited author abstract) 10 refs.

**Production** See RARE EARTH COMPOUNDS—Electrolysis.

**Radiation Effects** See Also X-RAYS—Emission.

**089184 RELATIVE INTENSITY DATABASE OF L-SHELL LINES OF LANTHANIDES AND ANALYSIS OF THE PIXE SPECTRA.** The PIXE spectra

resulting from proton beam bombardment in the energy range of 1 to 2.5 MeV of the thin targets of 14 lanthanides were measured using a Ge detector to obtain a relative intensity database of the L-shell lines. The database utilizes the relativistic Hartree-Slater (RHS) emission rates reported by Scofield. To correct the other quantities affecting the relative intensities such as L-subshell ionization cross sections etc., empirical factors are introduced and the values are determined by the least squares method. The reduced chi-squared value is  $0.85 \pm 0.4$  for 90 spectra. The relative intensities of Nd, Dy and Yb obtained at 2 MeV are compared with the recent ECPSSR approach by Cohen and Harrigan, and it is found that these results are in fairly good agreement. (Edited author abstract) 11 refs.

**089185 STUDIES ON SEPARATION OF RARE EARTH ELEMENT COMPLEXES WITH IMINODIACETATE ACID ON STRONGLY BASIC ANION EXCHANGERS IN DIFFERENT FORMS.** Purification of yttrium from dysprosium, holmium, erbium and ytterbium has been studied on the strongly basic anion exchanger Dowex 1X4 in an acetate form and for comparison in an iminodiacetate form. The rare earth element solutions complexed with iminodiacetate acid Ln(imda)<sub>2</sub> were separated using frontal analysis. The obtained results show the significant effect of an anion exchanger form on separation of Ln(imda)<sub>2</sub> complexes. An acetate form of the anion exchanger proves particularly effective and economical in yttrium separation from dysprosium, holmium and erbium but IDA form for yttrium separation from ytterbium. #### Spectroscopic Analysis See Also X-RAY ANALYSIS.

**089189 MATRIX EFFECTS IN THE SEPARATION OF RARE-EARTH ELEMENTS, SCANDIUM, AND YTTRIUM AND THEIR DETERMINATION BY INDUCTIVELY COUPLED PLASMA OPTICAL EMISSION SPECTROMETRY.** Due to sensitivity and reproducibility, inductively coupled plasma optical emission spectrometry (ICP-OES) has developed into a very promising technique in the determination of the rare-earth elements (REE), Sc, and Y. However, the changing composition of natural samples may cause severe problems during separation from concomitant elements (matrix elements). In this study a simplified version of REE separation from 8 major and 27 trace elements is proposed. Some major matrix elements, depending on their kind and quantity, cause a specific depression of recovery rates of light REE (LREE) during the ion exchange process. (Edited author abstract) 31 refs.

Zachmann, D.W. (Technische Univ Braunschweig, Braunschweig, West Ger). *Anal Chem* v 60 n 5 Mar 1 1988 p 420-427.

**089190 HOMOGENEOUS LINEWIDTHS AND PHOTON ECHO DECAY RATES OF RARE EARTH AND TRANSITION METAL IMPURITIES IN GLASSES.** We outline a general theory of homogeneous linewidths and photon echo decay rates of rare earth and transition metal impurities in glasses. The near-quadratic temperature dependence observed in the homogeneous linewidth for  $T \geq 10$  K is attributed to a Raman process involving low-lying harmonic vibrational modes which co-exist with ordinary sound waves. We calculate the temperature dependence of the linewidth for  $10\text{K} < T < 300\text{K}$  using a density of states for these modes obtained from inelastic neutron scattering studies of vitreous silica. 6 refs.

#### RAYON YARN

##### Elasticity

**089197 EFFECT OF TWIST ON FLEXURAL RIGIDITY AND ELASTIC RECOVERY OF ACRYLIC-VISCOSE ROTOR-SPUN YARNS.** All-viscose fiber yarns showed higher flexural rigidity and lower elastic recovery. An increase in twist led to a significant increase in yarn flexural rigidity. The rigidity of the fibers being blended and their position in the yarn also affected the flexural rigidity of the blended yarn. (Author abstract) 7 refs.

Kaushik, R.C.D. (Technological Inst of Textiles, Bhiwani, India); Salhotra, K.R.; Tyagi, G.K. *Indian J Text Res* v 12 n 4 Dec 1987 p 220-221.

##### Spinning

**089198 EFFECT OF TWIST ON CHARACTERISTICS OF ACRYLIC-VISCOSE ROTOR-SPUN YARNS.** Yarn twist has a great influence on the characteristics of ring-spun yarns. The impact of yarn twist could be very different in the case of rotor-spun yarns owing to rotor yarn's structural difference with ring-spun yarns. The effect becomes even more complex because of the non-homogeneous characteristics of the blend fibers. This study reports the contribution of twist to the breaking strength, extension at break, and any association between twist loss and yarn unevenness in acrylic-viscose rotor-spun yarns. (Author abstract) 8 refs.

Kaushik, R.C.D. (Technological Inst of Textiles, Bhiwani, India); Salhotra, K.R.; Tyagi, G.K. *Indian J Text Res* v 12 n 3 Sep 1987 p 139-141.

**089199 INFLUENCE OF DOUBLING ON CHARACTERISTICS OF ACRYLIC-VISCOSE RAYON ROTOR-SPUN YARNS.** Rotor-spun yarns possess a lower mean breaking strength than the corresponding ring-spun yarns owing to the incidence of wrapper fibers and twist loss. Doubling twisting improved the tenacity of acrylic-viscose rayon yarns markedly by increasing the inter-fiber cohesion in the yarn. (Author abstract) 9 refs.

Kaushik, R.C.D. (Technological Inst of Textiles, Bhiwani, India); Salhotra, K.R.; Tyagi, G.K. *Indian J Text Res* v 12 n 3 Sep 1987 p 142-145.

**089200 CONTRIBUTION OF FIBER LENGTH AND FIBRE DENIER TO CHARACTERISTICS OF RING- AND ROTOR-SPUN VISCOSE RAYON YARNS.** Contrary to the view held so far that the strength of rotor-spun yarns is relatively insensitive to fiber length, the maximum tenacity is observed for fibers of 38 mm length. Rotor yarns spun either from finer or longer fibers exhibit lower breaking extension. The unevenness decreases with increase in fiber length in ring-spun yarns but shows an upward trend in rotor-spun yarns. (Author abstract) 10 refs.

Kaushik, R.C.D. (Technological Inst of Textiles, Bhiwani, India); Salhotra, K.R.; Tyagi, G.K. *Indian J Text Res* v 12 n 3 Sep 1987 p 146-148.

#### RECORDING See Also MAGNETIC DEVICES, THIN FILM—Mathematical Models.

**089201 ZAPIS PIONOWY - NOWY SPOSOB REJESTRACJI MAGNETYCZNEJ.** [Vertical Recording - New Procedure of Magnetic Registration]. Characteristics of vertical magnetic recording technique are presented. Basic physical phenomena in the magnetic head - medium interaction are discussed. Methods of both write and read by means of heads and media of different designs are presented. (Edited author abstract) In Polish. 11 refs.

Depta, Robert. *Elektronika* v 28 n 5 1987 p 19-21.

**089202 AUDIO ANALYSIS VII: DIGITAL COPYING OF COMPACT DISKS.** The Son PCM-601 Digital Audio Processor turns digital audio signals into a video signal and vice versa. It has analog and digital audio inputs and outputs. Because of its modest 1400 dollars retail price and specifications that are similar to professional units, it is often used to record master tapes used to make compact disks (CDs). Its digital input and a VHS videocassette recorder's (VCR) 6-hr recording time make it appear to be an attractive device for copying CDs. The paper explains how PCM recording on videotape works, and discusses such subjects as CD changers, selecting a VCR, video quality, and various uses for the Sony PCM-601. 5 refs.

**089203 HIGH DENSITY MAGNETIC RECORDING HEAD SLIDER FOR SMALL RIGID DISK.** The new negative pressure slider called NNP slider has been developed for the attainment of high density recording in magnetic disk drives. The NNP slider has high stiffness and a very small flying height of 0.1  $\mu\text{m}$  independent of the disk velocity. And in using an actual disk (a sputtered disk), the NNP slider can follow the vertical run-out of the disk and fly stably, even though the flying height may fluctuate due to the undulation or roughness of the disk. Therefore, crash phenomena do not occur. The stable flying of the NNP slider can bring out the best properties of the sputtered disks. 2 refs.

**Equipment** See OSCILLOSCOPES, CATHODE RAY.

**Ferrite Applications** See Also DATA STORAGE, MAGNETIC—Disk.

**089206 FILM HEAD READ RESOLUTION AND FREQUENCY RESPONSE ANALYSIS.** The read resolution of a ferrite recording head is determined by its gap length, which also determines its writability. However, under broad conditions of practical interest, the read resolution of a film head can be shown to depend primarily on the sum of the poletip and gap lengths  $P1 + g + P2$ . This

permits choosing the sum to give needed resolution while independently optimizing the gap for writing. This paper describes conditions under which the resolution of a head is determined by: gap and head-to-medium spacing, the sum of poletip and gap lengths (Pp for short), and head-to-medium spacing or head-to-medium spacing only. Pure longitudinal recording is assumed, and the resolution determining factors are derived by a closed form frequency analysis. 4 refs.

Arnoldussen, Thomas C. (IBM, San Jose, CA, USA). *IEEE Trans Magn* v MAG-23 n 5 Sep 1987, INTERMAG '87: Int Magn Conf, Tokyo, Jpn, Apr 14-17 1987 p 3152-3154.

**089207 RECORDING CHARACTERISTICS OF SEMIHARD MN-ZN FERRITE SPUTTERED DISKS.** Thin films of ferrite such as  $\text{Co-}\gamma\text{Fe}_2\text{O}_3$  and  $\text{BaFe}_{12}\text{O}_{19}$  are useful for magnetic layers in high density recording disks. However, they have to be deposited on the substrates at considerably high temperatures (e.g., 250 and 500°C, respectively). In this study, Mn-Zn ferrite films with relative high coercive forces have been prepared at substrate temperature as low as 100°C, using 'Facing Targets Sputtering' apparatus. Their read/write characteristics have been evaluated by means of a conventional ring head. The reproduced signals exhibited dipulse waveforms with dipulse ratios of 0.3. A recording density  $D_{50}$  of about 60kFRPI was attained. 4 refs.

**Instruments** See Also DATA CONVERSION, ANALOG TO DIGITAL; OSCILLOSCOPES, CATHODE RAY.

**089208 SIGNAL CONDITIONING AND ANALOG-TO-DIGITAL CONVERSION FOR A 4-MHz, 12-BIT WAVEFORM RECORDER.** The analog-to-digital converter (ADC) in the HP 5183A Waveform Recorder samples at a rate of four million samples per second and provides 12 bits of amplitude resolution. Key features of the analog circuitry include the design of a modern discrete operational amplifier, a discrete sample-and-hold circuit, series-parallel ADC topology with pipelined ADC timing, a low-noise oscillator, and pseudorandom noise to improve the ADC's linearity. Digital signal processing techniques can be used on the raw digital data to increase the signal-to-noise performance; these techniques include averaging multiple measurements and oversampling (with respect to input signal bandwidth) followed by digital filtering. These issues are discussed in detail. 1 ref.

Gee, Albert; Young, Ronald W. *Hewlett Packard J* v 39 n 1 Feb 1988 p 15-22.

**089209 DIGITAL DESIGN OF A HIGH-SPEED WAVEFORM RECORDER.** This article examines how the design of the HP 5185A Waveform Recorder digital hardware provides the ability to capture and focus upon the portion of the signal conveying the desired information. A design overview is followed by a discussion of the digital system, timing issues, DC-to-250-MHz operation, pipeline partitioning, data deceleration, the analog-digital trigger, and two-channel synchronous data storage. 3 refs.

Pon, Rayman W.; Bird, Steven C.; Deane, Patrick D. *Hewlett Packard J* v 39 n 1 Feb 1988 p 32-38.

**089210 WAVEFORM RECORDER DESIGN FOR DYNAMIC PERFORMANCE.** The authors describe the relation between various types and sources of phase noise and the effects of this noise on amplitude errors when sampling high-slew-rate signals. They then discuss considerations related to the choice of oscillator topology, circuit design, and component selection to achieve the required performance in the SAW reference oscillator, that is, less than 2 ps rms phase jitter. Finally, they review how dynamic performance is measured and outline the closed-form sine wave curve fitting algorithm used in production testing of the HP 5185A. 10 refs.

**089211 ON THE ORIGIN OF  $K_U$  IN AMORPHOUS RE-TM MAGNETO-OPTIC RECORDING MATERIALS.** Exchange anisotropy was recently proposed as the origin of uniaxial perpendicular anisotropy in some Re-Tm thin films. This magnetic anisotropy arises from the exchange interaction between the ferrimagnetic matrix and acicular shaped single domain ferromagnetic regions. Rotational hysteresis measurements on GdCo films show a non-vanishing value of the rotational magnetic hysteresis for magnetic fields greater than the magnetic anisotropy field ( $H_K$ ). Such a behavior, first discovered in Co-CoO, is a necessary but not a sufficient condition for exchange anisotropy. A two dimensional idealized model of the amorphous RE-TM thin film that exhibits exchange anisotropy is proposed. 8 refs.

**089212 TRANSITION POSITION AND AMPLITUDE FLUCTUATION NOISE MODEL FOR LONGITUDINAL THIN FILM MEDIA.** This paper presents a transition noise model for square wave recording on longitudinal thin film media considering two sources of noise model for square wave recording on longitudinal thin film media considering two sources of noise: phase shift (or transition jitter) and amplitude. The transition jitter noise is due to random fluctuations in the transition positions, while the amplitude noise is due to random shape fluctuations in the transitions. It is assumed that random medium coercivity fluctuations cause transition position fluctuations. It is assumed that random medium coercivity fluctuations cause transition position fluctuations. The random transition shape fluctuations are modeled by allowing the transition parameter  $a$  to be a random variable. These transition parameter variations are assumed to be caused by random medium magnetization fluctuations. Each written transition produces a demagnetizing field that affects the positions and shapes of subsequent transitions. The properties of both types of noise are discussed. (Edited author abstract) 6 refs.

## Mathematical Models

**089214 NONLINEAR SUPERPOSITION IN SATURATION RECORDING OF DISK MEDIA.** The magnetic readback signal is generally assumed to be made up of linearly superposed single transition responses. As the transition spacing is reduced, this property is seen not

to hold. With particular disks, we find the head signal can be reconstructed as a linear superposition of variably spaced individual transitions, while with cobalt alloy film disks, both the spacing and the amplitude of individual transitions vary as a function of the data. This behavior is interpreted by a self-consistent 2D recording model, linear superposition improves dramatically with low  $M_t$  disk media. (Author abstract) 6 refs.

**089215 DYNAMICS OF HEAD-DISK CONTACT-IMPACT IN MAGNETIC RECORDING.** One of the critical areas of the magnetic storage process is the dynamics of suspending a magnetic recording head over a rotating rigid disk while maintaining a finite clearance between the disk and the slider carrying the head. A simulation tool is developed and applied to analyze the dynamics of a slider flying under the influence of aerodynamic forces and subject to intermittent contact by rapidly moving disk surface defects such as localized asperities. 10 refs.

**089216 TRANSITION BETWEEN SLIDING AND FLYING OF A MAGNETIC RECORDING SLIDER.** We investigate the dynamics of a magnetic recording slider of a rigid disk file during its transition between sliding and flying. The slider is modeled as a three degree-of-freedom system, capable of lift, pitch, and roll. In addition to considering loads from air pressure, inertia, and the suspension arm, we also consider impulsive loads arising from slider/disk collisions. A coefficient-restitution model is introduced. Numerical results are provided for typical conditions of disk velocity, suspension preload, and surface roughness. 7 refs.

**Measurements** See Also MAGNETIC TAPE—Magnetic Properties.

**089217 SIMULTANEOUS MEASUREMENT OF HEAD-DISK SPACING AND REPRODUCED OUTPUT IN FLEXIBLE PERPENDICULAR MAGNETIC RECORDING DISK DRIVE.** The authors have successfully developed a new system capable of measuring the dynamic spacing between head and flexible disk. By using this system with the single-pole head, spacing changes and amplitude variations of reproduced output can be measured simultaneously as continuous data. The main purpose of the present paper is to describe this new measuring method for spacing loss. Data of the relation between head-disk spacing and reproduced output is additionally shown as an example. 9 refs.

**089218 MEASUREMENT METHOD FOR THE SPACING FLUCTUATION OF A HEAD SLIDER IN A MAGNETIC DISK DRIVE.** The fact that disk wavy deformation brings about an increase in head friction force and causes damage was revealed experimentally. The RSM method, which can be used to evaluate head slider spacing fluctuation, induced by disk waviness, was investigated. Taking into account spacing loss in recording, spacing fluctuation measured by the RSM method was in good agreement with that estimated theoretically. 6 refs.

14-17 1987 p 3450-3452.

**089219 COMPARISON OF OPTICAL AND CAPACITIVE MEASUREMENTS OF SLIDER DYNAMICS.** A simultaneous slider air bearing thickness measurement is made using capacitive and optical techniques. The first technique measures the capacitance between a conducting disk and a probe attached to the slider, and the other measures the optical path length using interferometry. A quartz disk with a transparent conductive coating is used for this experiment. Measurements are made simultaneously at three corners of the slider from DC to 100 kHz. The DC flying height measurements agree to within 7 nm while the AC fluctuations agree to within the noise level of each technique (0.2 nm). 7 refs.

**089221 MOTION PICTURES OF AIR BEARING DYNAMICS UNDER STRESSED CONDITIONS.** We present here a study of the motion of an air-bearing slider at low flying heights as it accesses over a particulate disk and interacts with asperities on the surface. The measurements are made using a capacitance technique, with a specially made multi-sensor slider and high bandwidth electronics. The slider's motion is captured using a fast digitizer and reconstructed in motion picture format. Three data sets are discussed as examples of the different types of motion which can occur due to the slider-disk interaction. 4 refs.

**089222 REDUCING FLYING HEIGHT DEGRADATION DUE TO TRACK ACCESS ACCELERATION ACTING ON A MAGNETIC HEAD SLIDER.** Flying height fluctuations in a magnetic head slider were measured during track access using an optical interferometric technique. It was found that flying height of the front rail decreases while that of the rear rail increases due to acceleration during track access. An analytical model of the flying height degradation is presented to predict the flying height degradation for both Watrous and Winchester suspensions. By reducing installation angle of the flexure element, it is possible to reduce the flying height degradation. The flying height degradation can also be reduced by reducing slider mass and offset in the flexure mounting surface from the slider mass center and by increasing slider's air bearing stiffness. 6 refs.

## Noise, Spurious Signal

**089223 SPECTRAL MODEL FOR TIME-BASE DISTORTIONS IN MAGNETIC RECORDING.** Time-displacement errors (also called time-base errors) cause signal distortion which is modelled as uncorrelated output noise of a linear time-invariant system. The power

spectrum of this noise along with the system's complex frequency response characterize overall system performance. These two quantities depend, functionally, on the time-displacement error. The theory developed here is applied to flutter effects in analog magnetic recording. The result is a parametric description for noise power spectrum, frequency response, signal-to-noise ratio, and coherence between input and reproduced signals. The only parameter required in this parametric description is the rms value of the time-displacement error. Representative laboratory measurements are included to show generally good agreement between theory and experiment. (Author abstract) 18 refs.

Totzek, Ulrich (Ruhr-Univ Bochum, Bochum, West Ger); Preis, Douglas; Bohme, Johann F. *AEU Arch Elektron Uebertrag Electron Commun* v 41 n 4 Jul-Aug 1987 p 223-231.

**089224 NOISE OF LOW-COERCIVITY SINGLE-LAYER PERPENDICULAR RECORDING MEDIA.** The noise of single layer CoCr media is investigated. A model is developed by treating the medium as a collection of columns. It appears that there is a strong correlation between magnetization direction of the columns. Neighboring columns tend to have the same magnetization polarity, indicating exchange interaction. It is concluded that the media consist of domains. The domain width increases with the medium thickness. These domains can also result in a poor signal response at short wavelength. (Author abstract) 10 refs.

## Optimization

**089226 OPTIMUM RECORDING CRITERIA FOR THREE-REGION THIN-FILM MAGNETIC HEADS.** Optimum recording criteria for three-region thin-film heads were derived using a comparison of the NiFe film anisotropy field with the yoke field values, computed with an extended transmission-line model. Karlquist's equation for the longitudinal fringe field was also used in order to obtain the magnetizing region boundaries of the head. On the basis of these criteria, the linearity of the yoke regime can be evaluated and the optimum design of single-turn three-region recording heads can be performed. (Author abstract) 15 refs.

## Performance

**089227 EFFECT OF CIRCUMFERENTIAL TEXTURE ON THE PROPERTIES OF THIN FILM RIGID MAGNETIC RECORDING DISKS.** The magnetic recording medium of C/CoNiCr/Cr was DC magnetron sputtered onto rigid disk substrates of various circumferential textures. The texture was characterized by mechanical and optical surface profilometry. Texture increased circumferential coercivity and squareness. Recording signal and signal-to-noise ratio improved while

overwrite worsened. Structural inhomogeneities in the carbon overcoat along the texture lines increased with texture. Texture improved the head-disk friction characteristics and increased the head lift-off time during start-up. Too coarse a texture led to performance degradation. 3 refs.

## Sampling

**089228 ADAPTIVE SAMPLE RATE: A FIRST-GENERATION AUTOMATIC TIME BASE.** When capturing transient signals, it is desirable to use a high sample rate to preserve input signal details. This limits the maximum recording time of the measurement. In the HP 5183A Waveform Recorder with Option 301 Adaptive Sample Rate (ASR), the input signal is sampled at the selected fast rate only when there is significant detail present, and at a much slower rate when there is no significant detail. Thus ASR maximizes the recording time without compromising signal integrity. The ASR implementation and the underlying signal processing theory are examined. 9 refs.

**089229 HIGH SENSITIVITY SINGLE-POLE HEAD WITH TRANSVERSE RETURN-PATH CORE OF FLUX.** A highly sensitive low noise and narrow-track width, main pole driven type single-pole head has been developed. This head is called TRF head (single-pole head with transverse return-path core of flux flow). It is a kind of main pole driven type single-pole head which operates only on one side of the recording medium, and is based on a new idea incorporated in the flux return-path portion, to improve the recording and reproducing sensitivity and to reduce its system noise. The THF head is especially effective for the recording and reproducing with narrow track widths. The development of this head has resolved the problem of insufficient sensitivity in conventional single-pole heads which was a barrier to using narrow track widths, and has provided the prospect of using narrow track width heads necessary for high density digital video recording. (Author abstract) 4 refs.

**089230 EFFICIENCY IMPROVEMENT OF ONE-SIDED PROBE HEADS FOR PERPENDICULAR RECORDING ON DOUBLE-LAYER MEDIA.** Two-dimensional lumped reluctance modeling shows that the real efficiency of the well-known W-shaped single-pole head, or WSP, is very low, but can be improved by more than 10 db by designing a new triangular coil-chamber geometry. The model also indicates that narrowing the track width with respect to the core width results in a further 5 db increase in output. Furthermore, a new head design, the V-shaped single-pole head (VSP), which shows some distinct advantages with respect to manufacturability, has also been modeled. The experimental results obtained from measurements on VSPs are in good agreement with the model calculations. Despite its somewhat lower efficiency (compared to a WSP with the same triangular coil chamber), this VSP yields >12 db output improvement compared to conventional WSP with a rectangular coil chamber and a wide track. (Edited author abstract) 9 refs.

MAG-23 n 5 Sep 1987, INTERMAG '87: Int Magn Conf, Tokyo, Jpn, Apr 14-17 1987 p 2479-2481.

**089231 SINGLE-TURN PERPENDICULAR THIN FILM HEADS.** This paper describes thin film heads, intended for use with CoCr perpendicular recording media, which were designed to bring the highest possible efficiency both in ring-type and pole-type constructions. The heads are of single-turn structure to minimize the yoke length, and all the magnetic films are deposited on substantially flat planes to avoid magnetic degradation. By employing such a scheme, both ring-type and pole-type thin film heads are shown to have efficiency comparable to that of VHS-type ferrite video heads. (Author abstract) 9 refs.

**089233 YOKE TYPE MAGNETORESISTIVE HEADS WITH SUPPRESSED BARKHAUSEN NOISE.** Dependence of the Barkhausen noise occurrence on the shape of magnetoresistive (MR) elements was studied. Attention was paid to the flux closure scheme in which an MR element is shaped into a 'picture frame' geometry called closed type MR element (CTMR element) with a small gap since the MR element of such configuration was not likely to be limited by the track pitch and width requirements when built in the multitrack head construction. MR characteristics at various small points of the CTMR element were measured using a Kerr-effect microscope to verify the Barkhausen noise suppression effect of the element. Then, 18-track yoke type MR elements were fabricated and compared for the reproducing characteristics. The comparison revealed that both noise level and higher harmonic distortion were about 10db lower with CTMR elements than with stripe MR elements. (Edited author abstract) 4 refs.

**089234 YOKE MAGNETORESISTIVE HEAD FOR HIGH TRACK DENSITY RECORDING.** For high track density magnetic recording, a new yoke MR head, which has two kinds of yoke elements and center-tapped differential MR elements, has been developed. The track width (2.7µm) of the head is determined by its yoke thickness. Magnetic anisotropy control of the yoke elements and differential MR elements configuration provide low noise and high sensitivity. Output voltage  $40\mu V_p-p/\mu m$  at 25 FRPM and less than -30db second harmonic distortion were obtained for 3µm recorded track width. Further, C/N values, which is the signal to noise ratio measured with a 10 kHz bandwidth, increased by 3db with differential MR elements configuration. This head has the potential to achieve high track density recording. (Author abstract) 12 refs.

**089235 HEAD CONTACT PRESSURE AND SLOW SPEED SLIDING TEST ON COATED MAGNETIC DISKS.** An analytical method to determine apparent contact pressure between a coated magnetic disk and head during slow speed sliding is proposed. Results of analysis show that as sliding velocity increases, contact force gradually decreases but apparent contact pressure peaks at a velocity slightly lower than that of the trailing edge take-off. A slow speed head sliding test was performed to compare the analytical and experimental results. Validity of contact pressure analysis was confirmed through friction force measurement during the test. However, disk lifetime change with sliding velocity did not coincide with that of the peak contact pressure. This indicates that the contact pressure has little effect on the sliding test lifetime. 8 refs.

## Theory

**089236 NEW THEORETICAL APPROACH TO DIGITAL MAGNETIC RECORDING.** The significance of the form of the assumed magnetization variation is studied in calculations of transition widths, output voltage waveforms and the effects of pulse crowding. While different transitions tend to have limited effects on pulse widths and output voltage waveforms, the effects on pulse-crowding roll-off curves are shown to be important, showing the need for a very accurate knowledge of the transition profiles. Error function and hyperbolic-tangent-shaped transitions are investigated, following evidence from T.C. Arnoldussen and H.C. Tong (1980) that the former may be nearer to the true transition shape. 9 refs.

## Thin Films

**089237 WILLIAMS-COMSTOCK TYPE MODEL FOR SAWTOOTH TRANSITIONS IN THIN FILM MEDIA.** We describe a model of the write process of sawtooth transitions on longitudinal thin film media. The width of the transitions is determined by the combined action of the head and dipolar fields against the coercivity of the film. We use the model to predict the dependence of transition width and location of the transition center on flying height, gap width, and write current for a Karlqvist head field. The transition width approaches the minimum permitted by the transition's dipolar field for low flying height. Unlike models of the write process on particulate media, it predicts that the transition does not relax after the film leaves the write head. (Author abstract) 7 refs.

## Dubuque, IA

**089241 GAS DETECTION SYSTEM PROTECTS DUBUQUE RACING TRACK.** The Dubuque Greyhound Park is a new \$12-million greyhound racing and parimutuel wagering complex constructed over a 120-acre landfill. Planners in Dubuque managed the methane problem by installing a sophisticated combustible-gas detection system throughout the 43-acre race track. The permanently installed monitoring system, manufactured by MSA (Mine Safety Appliances Company) of Pittsburgh, Pennsylvania, coupled with a rather simple but effective built-in ventilation system, has reduced the possibility of a methane explosion. Consisting of an underground network of plastic pipes, the ventilation system draws out trace amounts of methane using wind-propelled turbines situated on the roof tops of several park buildings. If the turbines are unable to adequately ventilate a pocket of methane, the permanent monitoring system will alert track personnel well before a potentially dangerous situation can arise.

**089247 COST ANALYSIS OF A TWO UNIT, THREE STATE STANDBY REDUNDANT COMPLEX SYSTEM WITH TWO TYPES OF REPAIR**

**FACILITIES UNDER WAITING.** This paper deals with the cost analysis of a two unit, three state standby redundant complex system, incorporating the concept of two types of repair facilities, viz. minor and major repair. The concept of waiting time for the major repair of the failed system has also been introduced. The system can suffer from two types of failures, namely catastrophic and partial. Failure and waiting times of units follow exponential time distribution, whereas repair of units follows general time distribution. Using the supplementary variable technique, Laplace transforms of probabilities of the complex system being in various states have been computed. Using Abel's lemma, steady state behavior has also been examined. Some important graphs have been sketched at the end to highlight the important results. (Edited author abstract) 10 refs.

## Optimization

**089248 SIMPLE METHOD FOR OPTIMAL REDUNDANCY ALLOCATION FOR COMPLEX NETWORKS.** A simple method for optimum redundancy allocation for complex networks is presented. A new heuristic criterion is introduced for solving the problem by decomposing the same in two phases. After finding all minimal path sets of the system in phase I, we choose a minimal path set having the highest value of the 'sensitivity factor'. In phase II we add one component to the stage having the largest value of the selection factor among the stages of the selected minimal path set. This procedure is continued until no more redundant component can be added within the available resources. The proposed method is simple, easily computerizable, fast and capable of handling problems subject to any number of constraints. (Edited author abstract) 17 refs.

Bala, Renu (Regional Engineering Coll, Kurukshetra, India); Aggarwal, K.K. *Microelectron Reliab* v 27 n 5 1987 p 835-837.

**089249 NEW HEURISTIC ALGORITHM FOR CONSTRAINED REDUNDANCY-OPTIMIZATION IN COMPLEX SYSTEMS.** A heuristic algorithm is given that solves the problem of constrained redundancy optimization in complex systems using minimal path sets. The algorithm gives an optimal solution in most cases without much special computational effort, although the solution is not necessarily the global optimum. Two examples are given to compare the performance of this algorithm with that of existing methods. 7 refs.

**089250 OPTICAL TIME-DOMAIN REFLECTOMETER FOR LONG 1.5-μm BAND OPTICAL FIBER CABLES.** An optical time-domain reflectometer (OTDR) for measuring long 1.5-μm band optical transmission lines

has been developed. A 1.59- $\mu\text{m}$  optical pulse generated from a  $\text{P}_2\text{O}_5$ -highly-doped optical fiber pumped by a 1.32- $\mu\text{m}$  Nd:YAG laser pulse is used as an optical source. A 103-km-long dispersion-shifted optical transmission line is tested using the OTDR. The result shows that the one-way dynamic range of the OTDR is estimated to be more than 30 db. (Author abstract) 7 refs.

Noguchi, Kazuhiro (NTT, Jpn); Suzuki, Kazunori; Uesugi, Naoshi. *Rev Electr Commun Lab (Tokyo)* v 35 n 5 Sep 1987 p 541-545.

**089251 HP FINDS A WAY TO PROBE DEEP INTO OPTICAL LINES.** Hewlett-Packard's HP 8145 A reflectometer is described that is bringing data correlation to optical time-domain reflectometers. Engineers will be able to look miles deeper into a glass fiber to spot a fault, as well as to make measurements faster than with any conventional instrument. As repeater distance gets longer because of more powerful lasers, lower-loss fibers, and more sensitive receivers, it is becoming increasingly difficult to characterize performance or find faults in optical transmission cables. The 8145 addresses this problem by increasing the distance over which reflectometers operate by up to 56%, depending on the wavelength and fiber type.

## Calibration

**089253 ESTIMATING THE RESIDUAL ERROR FROM CALIBRATING A REFLECTOMETER WITH A SLIDING TERMINATION.** A sliding termination is often used to approximate to  $\Gamma=0$  when calibrating a reflectometer with equivalent generator mismatch  $\Gamma_G$ . The paper shows that a residual error of  $|\Gamma_G|^2 |\Gamma_T|^2$  results (where  $|\Gamma_T|$  is the amplitude of reflection from the variable phase load and \* denotes complex conjugate) and compares this error with the precision of available calibration standards. (Author abstract) 9 refs.

Griffin, E.J. (Royal Signals & Radar Establishment, Great Malvern, Engl); Hodgetts, T.E. *IEE Proc Part H* v 134 n 6 Dec 1987 p 560-562.

**089254 SIX-PORT REFLECTOMETER AND ITS COMPLETE CALIBRATION BY FOUR STANDARD TERMINATIONS.** An alternative nonlinear method to calibrate the six-port reflectometer is developed. Using this method, four standards and an iterative procedure are needed to calibrate the reflectometer. Experimental results show that this method converges very rapidly, provides a good accuracy in calibration parameters and at the same time avoids degenerate solutions which produce unwanted singularities in the measurement. (Author abstract). 12 Refs.

Ghannouchi, F.M. (Ecole Polytechnique, Montreal, Que, Can); Bosio, R.G. *IEE Proc Part H* v 135 n 4 Aug 1988 p 285-288.

**089255 NEW SIX-PORT CALIBRATION METHOD USING FOUR STANDARDS AND AVOIDING SINGULARITIES.** An explicit linear method using four known standards to calibrate a six-port reflectometer is presented. The calibration parameters are obtained using only linear equation techniques to facilitate encoding the computation in low-level computer language. The method shows that no singularities appear

over the calibration frequency range, contrary to other methods using the same reflectometer. 16 refs.

## Design

**089256 MEASUREMENT OF MICROWAVE DEVICE PARAMETERS WITH THE AID OF MULTITERMINAL REFLECTOMETERS.** Measurement of complex microwave parameters with the aid of twelve-terminal reflectometers is based on the determination of phase shifts between microwave signals from the results of measurement of relative powers dissipated in the reflectometer arms. This method allows simple calibration and automation of measurements in automatic microwave circuit analyzers (AMA) based on a twelve-terminal reflectometer and general-purpose computer. The portability of twelve-terminal reflectometers makes it possible to connect them directly to the device being tested so that a large number of simple and inexpensive reflectometers can be combined into multichannel parallel AMAs for measuring the wave scattering parameters of multiterminal devices. In this paper the authors discuss the problems associated with the design and calibration of individual twelve-terminal reflectometers that form the main components of AMAs. 8 refs.

Yatskevich, V.A. *Meas Tech* v 30 n 3 May 1987 p 279-285.

**089257 TIME-OF-FLIGHT NEUTRON REFLECTOMETER FOR SURFACE AND INTERFACIAL STUDIES.** A time-of-flight neutron reflectometer constructed for surface and interfacial studies, and installed at the ISIS pulsed neutron source, is described. One of its important design features is its inclined incident beam, since this allows both liquid- and solid-surface phenomena to be investigated. Measurements are presented to show the performance of the instrument, and new representative results, which include studies of liquid surfaces, Langmuir-Blodgett films, and thin-film multilayers, are included as illustrations of the scientific potential of the method. (Author abstract) 23 refs.

## Infrared

**089258 1.5- $\mu\text{m}$ -BAND OPTICAL TIME DOMAIN REFLECTOMETER FOR SINGLE-MODE OPTICAL FIBER USING A  $\text{P}_2\text{O}_5$ -HIGHLY-DOPED FIBER RAMAN LASER.** A wide-dynamic-range 1.5- $\mu\text{m}$ -band optical time-domain reflectometer (OTDR) for single-mode optical fibers using a  $\text{P}_2\text{O}_5$ -highly-doped fiber Raman laser light source and a cooled Ge-p-i-n photodiode is realized for the first time. The stimulated-Raman-scattering properties of  $\text{P}_2\text{O}_5$ -doped single-mode fiber are investigated. Using this fiber and an Nd:YAG laser operating at 1.32  $\mu\text{m}$ , a high-power light pulse at 1.59  $\mu\text{m}$  is generated with high efficiency. Using the stimulated-Raman-scattering light as the light source and a high-sensitivity optical receiver, a 1.5- $\mu\text{m}$ -band OTDR having a one-way dynamic range of 35 dB is realized. 14 refs.

Suzuki, Kazunori (NTT, Tokai, Jpn); Noguchi, Kazuhiro; Uesugi, Naoshi. *J Lightwave Technol* v 6 n 1 Jan 1988 p 94-99.

## Laser Applications

**089259 AUTOMATIC LASER INTERFERENCE REFRACTOMETER FOR STUDYING THE DISPERSION OF GASES.** An interference refractometer, for studying the dispersion of optically transparent gases in the visible and near-IR ranges (0.4-1.1  $\mu\text{m}$ ) of the spectrum, is described. The refractometer employs a

radiation selection block, which is used for periodic sequential input of radiation with different wavelengths into the interference refractometer, which raises the reliability of the determination of the coefficients in the dispersion equation for different states of the gas and reduces severalfold the time required for performing the experiments. (Edited author abstract) 10 refs.

Mishchenko, Yu.V. *Instrum Exp Tech* v 30 n 3 pt 2 May-Jun 1987 p 689-693.

## Mathematical Models

**089260 COMPARATIVE STATISTICAL STUDY OF SOME PROPOSED SIX-PORT JUNCTION DESIGNS.** Reflection coefficient measurements obtained from six-port reflectometers are analyzed from a statistical and geometrical point of view. The analysis concentrates on the effect of using noisy power meters. A simply computed, geometrically interpretable estimator of the reflection coefficient possessing certain optimality properties is derived. A suitable performance measure for this estimator is calculated for a number of different six-port designs as the true reflection coefficient ranges over the area of the Smith chart. For each design, a contour map of the measure allows for easy comparison of the designs in different regions of the Smith chart. 18 refs.

Berman, Mark (Natl Measurement Lab, Lindfield, Aust); Somlo, Peter I.; Buckley, Michael J. *IEEE Trans Microwave Theory Tech* v MTT-35 n 11 p 971-977.

## Microwaves

**089261 SINGLE-HORN REFLECTOMETRY FOR IN SITU DIELECTRIC MEASUREMENTS AT MICROWAVE FREQUENCIES.** The ability of single-horn reflectometry to determine reflectivity and, hence, calculate dielectric properties using plane-wave interpretation theory, has been investigated experimentally. The horn is part of a portable field unit operating at X-band and was placed above various natural materials. Good results were obtained for water and saline ice, which were flat and lossy, but not for an electrically thick sheet of fresh lake ice, for which reflectivity at the bottom interface was strong. 10 refs.

**089263 OTDR SPLICE LOSS MEASUREMENTS: AN EXPLANATION.** When splicing optical fibers, OTDRs (Optical Time Domain Reflectometers) are often used to monitor and optimize splice loss. Their primary use may be in finding fiber breaks for emergency restoration. They are also used to measure fiber attenuation and connector or splice loss in installed cable systems. We are often asked why OTDR measurements differ from loss or attenuation measured by a source and power meter, and

why splices and connectors sometimes show a 'gain' in violation of common sense and physical laws. These and related questions are discussed.

Hayes, Jim. *TE&M* v 91 n 21 Nov 1 1987 p 76-77.

**089264 NEW TECHNIQUE IN O.T.D.R.** Using a new correlation technique, time-domain reflectometry measurements of optical fibre are obtained 64 times faster than is possible with conventional single-pulse methods, given the same laser, receiver and optical coupling. Special emphasis is placed on backscattering impulse response, performance parameters and signal-to-noise ratio considerations. 11 refs.

Newton, Steve. *Electron Wireless World* v 94 n 1627 May 1988 p 496-500.

## Testing

**089265 SIX-PORT REFLECTOMETER.** A six-port reflectometer consisting of a symmetrical five-port waveguide junction and a directional coupler was analyzed, constructed and tested. Theoretical and experimental results showed that the circuit yielded optimum q-point distributions over the waveguide bandwidth. Actual measurements taken using the prototype reflectometer indicated that accuracies of  $\pm 0.05$  in magnitude and  $\pm 0.5^\circ$  in phase were obtainable. (Author abstract) 7 refs.

## REFRACTOMETERS

### Applications

**089266 FIBER OPTIC REFRACTOMETER FOR SPECIES CONCENTRATION MEASUREMENT IN A MICROWAVE ENVIRONMENT.** A miniature fiber optic refractometer has been developed to measure the species concentration of a fluid which is heated in a microwave oven. The probe, which measures the local fluid temperature and refractive index, is easily constructed using a commercially available fiber optic thermometer and standard laboratory equipment. (Edited author abstract) 6 refs.

Bergman, T.L. *J Microwave Power Electromagn* v 22 n 3 1987, Radio Freq Ind Appl, 1987 p 181-183.

### Design

**089267 OPTICAL FIBRE REFRACTOMETER FOR LIQUIDS USING TWO MEASUREMENT CHANNELS TO REJECT OPTICAL ATTENUATION.** A method is proposed to implement an optical fiber sensor for the measurement of the refractive index of liquids whose optical attenuation may not be considered negligible. The fibers can be immersed directly in the liquid, or placed outside a transparent cell. Three mathematical models are developed for these two configurations and we show that the second configuration is more advantageous. Experimental measurements tend to confirm the validity of one of the three models. (Author abstract) 12 refs.

**089270 ERGEBNISSE ZUR BRUCHMECHANISCHEN BEWERTUNG FEUERFESTER BAUSTOFFE.** [Results of an Evaluation of Fracture Mechanical Characteristics of Refractory Materials]. The purpose of this study was to examine the applicability of fracture mechanics test methods to heterogeneous heavy clay ceramics. The effect of the test condition and the fracture mechanical characteristics of refractory materials are investigated. When examining the validity of service life prediction in the range of low temperatures, a satisfactory agreement of the experimental results with the predictions was achieved. In the range of high temperatures, this agreement was obtained only in case of high static loads. (Translated author abstract) 15 refs. In German.

Schulle, Wolfgang (Bergakademie Freiberg, Freiberg, East Ger); Kotrc, Michal. *Sprechsaal* v 120 n 10 Oct 1987 p 871-874, 876, 879.

**089271 PERICLASE COMPOSITIONS: A THERMOMETER FOR MAGNESIA-CHROMITE REFRACTORIES.** Statistical analysis of published data on the compositions of periclases coexisting with spinel has been used to model mathematically the temperature-dependence of the limiting composition of periclase for the temperature range 1700°C to below 1400°C. The 'blocking temperature' (approximately the temperature of effective cessation of diffusion) of periclases from common refractory compositions is in the range 1350 to 1400°C. This is substantially below the peak firing temperature of manufacture and also below the usual temperature of use of periclase-chromite refractories. The compositions and the proportions of periclase and spinel in refractories used above the blocking temperature vary with changes of temperature, with important consequences for refractory microstructure and performance. (Author abstract) 16 refs.

Butler, B.C.M. (Univ of Oxford, Oxford, Engl); Suli, E.E. *Br Ceram Trans J* v 87 n 1 Jan-Feb 1988 p 14-16.

**089272 HOLLOW CORUNDUM SPHERES FOR HIGH TEMPERATURE THERMAL INSULATION.** Hollow corundum spheres offer possibilities for developing high-quality structural and thermal insulation refractories for lining thermal units including those working in hydrogen-containing atmospheres at a service temperature exceeding 1700°C. The authors developed a technological route for the production of hollow electrocorundum spheres intended for manufacturing highly refractory thermal insulation products, concrete bodies, and loose charges. The technology was tested under industrial conditions. 8 refs.

Karlin, V.V. (All-Union Scientific-Research Inst VNIASH, USSR); Khizhnyak, N.P.; Engel'brekt, V.G.; Permikina, N.M.; Evdokimova, Z.U.; Panov, G.A.; Belogradov, A.G.; Gromov, S.Yu. *Refractories* v 28 n 7-8 Jul-Aug 1987 p 386-389.

**089273 INTRODUCTION OF THE PRODUCTION OF VIBROCAST CORUNDUM AND MULLITE-CORUNDUM BURNER BLOCKS FOR SINTERING HEARTHES AT WESTERN SIBERIA METALLURGICAL COMBINE.** One of the means of reducing the specific fuel composition in sintering machine hearths is the use of flat flame burners. To provide satisfactory operation of the burners and an increase in hearth service life it is necessary to use heat resistant mullite-corundum burner blocks which are large parts with a weight of up to 280 kg and more in them. This article presents the results of introduction into Western Siberia Metallurgical Combine of the production of these parts. Mixtures based on corundum, fused mullite, alumina, mullite-corundum chamotte, and clay developed in the Ukrainian Scientific-Research Institute for Refractories were used. 5 refs.

Primachenko, V.V. (Ukrainian Scientific-Research Inst for Refractories, USSR); Anisimova, T.A.; Kustov, B.A.; Sel'skii, B.I.; Zibarev, N.A.; Titov, N.V. *Refractories* v 28 n 7-8 Jul-Aug 1987 p 395-398.

**089274 THERMAL INSULATION MATERIALS BASED ON SPHERICAL CORUNDUM.** For the lining of thermal equipment with a hydrogen-containing medium and a working temperature up to 1800°C corundum refractories, which are characterized by the optimum combination of physicochemical and thermomechanical properties, are promising. To obtain corundum thermal insulation parts with more than 99 wt.%  $Al_2O_3$  a mixture of G-00 and GK (85-95%  $\alpha-Al_2O_3$ ) aluminas and foam polystyrene was used. After firing the parts had an apparent density of 1.05-1.08 g/cm<sup>3</sup>, a compressive strength of 7.5-20 N/mm<sup>2</sup>, and an additional volumetric shrinkage at 150°C of less than 1%. For the purpose of obtaining shrinkage-free thermal insulation corundum parts it is desirable to use a porous filler of aluminum oxide distinguished by a constant volume in heating to 1800°C. Hollow corundum granules (spherical corundum) produced by inflation of molten corundum meet these requirements. 5 refs.

### Additives

**089275 EFFECT OF PHOSPHATE BINDERS ON THE STRENGTH OF THE MATERIAL BASED ON ELECTROCORUNDUM AND PYROPHYLLITE.** This paper deals with a study of the material obtained by introducing pyrophyllite into the composition (body) of a corundum concrete based on a phosphate binder (pyrophyllite addition is known to change the properties of the concrete significantly). Addition of pyrophyllite to the system of corundum concrete produced using phosphate binders leads to a reduction in the temperature of setting (hardening) up to room temperature, an increase in the strength at moderate temperature (up to 973°K), a significant resistance to softening in the 973-1273°K range, and an improved thermal shock resistance. The increase in the strength during the heating process can be attributed to the formation of complex polymeric forms of aluminum and silicon phosphates in the material which largely remain amorphous when heated up to 1723°K at a rate of 0.5-1°K/min. Above 1473°K, a small amount of a liquid phase (silicon pyrophosphate) forms in the material whose quantity decrease with increasing pyrophyllite content. 7 refs.

**Alumina** See Also ALUMINA—Mechanical Properties; ALUMINA—Sintered; BLAST FURNACES—Refractory Materials; CERAMIC MATERIALS—Hardening; COMPOSITE MATERIALS—Fracture; FURNACES, MELTING—Refractory Materials; LADLES—Lining.

**089276 VARIATIONS IN SINTERING KINETICS AND MICROSTRUCTURE OF ALUMINA WITH CHROMIUM AND MOLYBDENUM ADDITIONS.** Chromium and molybdenum were introduced into alumina through gel synthesis. Both elements are soluble in aluminum hydroxide and low-temperature (<1400°C) aluminum oxide. In the course of transformation from hydroxide to oxide, the evaporation-condensation of vapour phase (below 1000°C) causes shrinkage of the porous compact due to particle rearrangement and growth through capillary drag and adsorption. Subsequently, differences in agglomerate structure, grain growth, solute atmosphere and densification arise because of variations in the crystallochemical behavior of chromium and molybdenum. The solute atmospheres of chromia-vacancy and molybdenum metal reveal sub-grain boundaries and dislocations. In chromia-alumina solid solution these defects annihilate and contribute to densification (98%th) with increase in temperature to 1600°C. However, with further rise in temperature to 1700°C, the solid solution desinters to 85%th and creep cavities show transition from grain boundary to lattice creep. In Mo-Al<sub>2</sub>O<sub>3</sub> composite the defects are locked by molybdenum solute, and as a result there is an insignificant increase in densification (30%th at 1600°C). (Author abstract) 36 refs.

Raman, S.V. (Brookhaven Natl Lab, Upton, NY, USA). *J Mater Sci* v 22 n 9 Sep 1987 p 3161-3166.

**089277 STRUCTURE FORMATION OF WATER SUSPENSIONS OF ALUMINA CONTAINING POLYSTYRENE ADDITIONS.** A study was made of the effect of the diameter of polystyrene balls and the pH of the suspension, with sulfite fly additions, on the rheological and structural-mechanical properties of the alumina suspensions and the properties of the heat-insulating articles. It was found that the optimum casting properties are possessed by suspensions of two casting ranges: pH=2.5 (acid deflocculation) and pH=9.5 (alkaline deflocculation). The optimum stabilizing additive is 2% sulfite fly. The tests established the possibility of making porous corundum articles with excellent properties by the casting method. 5 refs.

**089278 SINTERING OF CERMETS BASED ON CORUNDUM AND MOLYBDENUM.** Use of corundum powder in molybdenum-containing cermets makes it possible to decrease the temperature required for obtaining dense materials by approximately 100°. In order to produce dense materials, it is necessary to limit the initial porosity of the compacts. Increasing the degree of dispersion of molybdenum obtains a material possessing more uniform structure and higher density and strength. The presence of molybdenum decreases recrystallization of corundum grains and obtains a stable structure that is resistant to high temperature heating cycles. 6 refs.

Fedotov, A.V. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 24-27.

**089279 STRONG CERAMIC IN THE Al<sub>2</sub>O<sub>3</sub>-ZrO<sub>2</sub>-Y<sub>2</sub>O<sub>3</sub> SYSTEM.** This paper deals with a study of the microstructure and some properties of ceramics of the Al<sub>2</sub>O<sub>3</sub>-ZrO<sub>2</sub> system containing Y<sub>2</sub>O<sub>3</sub>. Y<sub>2</sub>O<sub>3</sub> was introduced as a stabilizing additive. Its content was varied from 1 up to 8 mole% with respect to ZrO<sub>2</sub>. A highly dense ceramic based on the eutectic composition obtained using 3 mole% Y<sub>2</sub>O<sub>3</sub> addition. The ceramic has a fine grained structure and high hardness and strength. 3 refs.

**089280 EFFECT OF THE ADDITIONS OF THE WASTE PRODUCTS OF RARE-EARTH ELEMENTS ON THE PROPERTIES OF MULLITE-ZIRCON SUSPENSIONS.** The effect of rare earth compounds on the rheological properties of mullite-zircon suspensions was studied. The optimum interval of casting

was established. The effect of the compounds on the sintering process was also studied. It is possible to decrease the sintering temperature by 100°C (up to 1450°C) without loss of thermal shock resistance of the products. 1 ref.

Degtyareva, E.V. (Ukrainian Komsomol KhADI, USSR); Gud', O.T.; Lisovaya, E.D.; Romaniv, O.N.; Maistruk, P.G. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 65-69.

**089281 STUDY OF THE PROCESS OF MULLITE FORMATION IN THE CORUNDUM-CLAY AND CORUNDUM-QUARTZITE SYSTEMS UNDER LOAD.** Protective refractory coatings and rammed linings made from high alumina bodies are widely used in the induction channel mixers (holding furnaces) for molten iron. During service, constancy of volume of such coatings is ensured owing to mullite formation which involves volumetric expansion. The authors studied the effect of compressive load and temperature on the process of mullite formation in alumina systems produced from electromelted corundum and clay or Ovruchsk quartzite incorporating orthophosphoric acid as a binder. The application of a stress of 0.4 N/mm<sup>2</sup> intensified the process of mullite formation. Increasing the firing temperature from 1300 up to 1500°C led to an increase of the mullite content in specimens fired with and without load. 11 refs.

**089282 OBTAINING SHRINK-FREE MULLITE LIGHTWEIGHT CERAMICS IN THE AlF<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub>-SiO<sub>2</sub> SYSTEM.** The authors investigated about 60 compositions with different ratios of AlF<sub>3</sub>, Al<sub>2</sub>O<sub>3</sub>, and SiO<sub>2</sub>. Using the mullite forming mechanism it is possible to synthesize mullite during firing of the goods without preheating the starting components. The solid phase synthesis of crystals of mullite leads to self-reinforcing of the ceramic material. The experimental batches showed that it is possible to obtain mullite articles with an apparent density of 0.65-2.00 g/cm<sup>3</sup>. 8 refs.

**089283 HIGH-ALUMINA CERAMIC POSSESSING HIGH THERMAL SHOCK RESISTANCE.** The aim of this investigation is to produce a heat-resistant material with good mechanical and electrical insulating properties and a low firing temperature. To prepare the specimens, we used the electrocorundum and alumina. The industrial aluminum chromium phosphate binder (ACPB) was used as a bonding agent. The obtained corundum materials containing ACPB are characterized by high thermal shock resistance and satisfactory mechanical and electrophysical properties. This is achieved owing to the formation of the aluminous (aluminum) phosphate cement that ensures strong bonds between corundum grains and facilitates their conversion into large agglomerates. 6 refs.

**089284 OPTIMIZING THE PROPERTIES OF CORUNDUM-BASED THERMAL INSULATION PRODUCTS USING THE METHOD OF EXPERIMENTAL PLANNING.** This paper deals with a study on the selection of granulometry of a corundum filler using the method of experimental planning for the purpose of optimizing the properties of pure corundum thermal insulation products of complex configuration. In these studies, we used hollow corundum spheres or a porous corundum chamotte (having 99.3-99.7 wt.% Al<sub>2</sub>O<sub>3</sub>) as a filler. We studied the effect of the limiting grain size and the type of filler on the apparent density and the ultimate compressive strength of the corundum-based thermal insulation prod-

ucts. The paper gives the characteristics of the factors affecting the properties of the corundum-based thermal insulation products. A complete factorial experiment made it possible to derive an equation that takes into account the qualitative and quantitative factors. 5 refs.

**089285 INFLUENCE OF PRELIMINARY COMPACTION OF THE MIXTURE ON THE QUALITY OF CHAMOTTE REFRACTORIES.** A method of production of ladle brick making it possible to eliminate scrap of parts for separation, reduce their porosity, and increase the compressive strength has been developed. Under the conditions at the Borovichi Refractory Combine the porosity dropped from 17.3-18.4 to 15.5-17.1% while the compressive strength increased from 27-40 to 68.6-93.0 N/mm<sup>2</sup>. The desirability of use of Kudinov deposit semiacid kaolinite-hydromicaceous clay as a raw material for the production of dense ladle brick and the possibility of use of Ust'e-Brynkino deposit BLP-1 clay have been shown.

**089287 REFRACTORY OF THE PAST FOR THE FUTURE: MULLITE AND ITS USE AS A BONDING PHASE.** Mullite is one of the most widely encountered and important compounds found in many industrial ceramic products. However, it is rare in nature, occurring uniquely on the Isle of Mull off the west coast of Scotland. Mullite as a bonding phase exhibits high refractoriness, low creep rate, low thermal expansion and thermal conductivity, good chemical and thermal stability, and good toughness and strength. 56 refs.

**Bonding** See Also **FURNACES, MELTING**—Refractory Materials; **PHENOLIC RESINS**.

**089291 REGULARITIES OF VIBRATORY COMPACTION OF REFRACTORY BODIES BASED ON PHOSPHATE BINDERS.** The relative effect of the parameters on the properties of the vibratory compacted specimens decreases in the following order: the moisture content of the body, the content of the finely milled fraction, the static pressure, the duration of application of static pressure, and the amplitude of vibrations. The optimum values of moisture content are as follows: ( $5 \pm 0.3\%$ ) for chrome-magnesite bodies, ( $4 \pm 0.2\%$ ) for corundum bodies, and ( $10 \pm 0.5\%$ ) for chamotte bodies. In this case, in all the bodies, the content of the dispersed phase varies in the 28-32% range. The following are the optimum parameters of the vibratory compaction process at a frequency of 50 Hz: static pressure —  $0.5 \text{ N/mm}^2$  for chrome-magnesite and corundum bodies and  $0.25 \text{ N/mm}^2$  for chamotte bodies; duration of application of static pressure — 60 sec; and amplitude —  $0.6-0.7 \text{ mm}$ . The specimens obtained using these parameters had a density difference of not more than 4% (abs.) along their height. 20 refs.

**089292 MULLITE-CORUNDUM RAMMING MASS CONTAINING GRAPHITE AND SILICON CARBIDE ADDITIVES.** This paper deals with a study of the optimum content of the graphite and silicon carbide additives in a mullite-corundum body produced incorporating a binder based on orthophosphoric acid; for this purpose, the simplex-grid method of experimental planning was used. The content of  $\text{Al}_2\text{O}_3$  in the original body amounted to not less than 88% and the  $\text{P}_2\text{O}_5$  content was 2.5-3.0%. We used crystalline graphite (GOST 5279-74) containing approximately 98% particles having a minus 0.09-mm size and the No. 12/6 grade silicon carbide (GOST 3647-80). Based on the conducted studies, authors developed a composition (system) of mullite-corundum body containing 10-13% graphite and 5-6% silicon carbide that makes it possible to produce rammed linings having fairly high strength, high resistance of the action of molten cupola slag and cast iron, and relatively low degree of oxidation of the graphite additive. 8 refs.

**089293 KINETICS OF BURNING-UP OF CARBON IN PITCH- AND COAL TAR (RESIN)-IMPREG-**

**NATED PERICLASE PRODUCTS.** It was established that the kinetics of the burning-up process of the carbonaceous substance has an exponential nature and in semilogarithmic coordinates, it can be described by a straight line relationship  $\log C = \alpha + \tan \alpha \tau$ . The intensity of burning-up of the carbonaceous substance increases with increasing test temperature. The rate of burning-up of the carbonaceous substance in the pitch-impregnated specimens is slightly less than that observed in the coal tar (resin)-impregnated specimens. Heat treatment of the impregnated products slows down burning-up of the carbonaceous substance. 3 refs.

Leve, E.N. (Ukrainian Scientific-Research Inst of Refractories, USSR); Antonov, G.I.; Shcherbenko, G.N.; Grivakova, Zh.A.; Kulik, A.S.; Gribanova, N.Ya.; Ryschenko, S.I. *Refractories* v 28 n 3-4 Mar-Apr 1987 p 192-195.

**089294 PROPERTIES OF GRAPHITE-CONTAINING CRUCIBLES.** A study of the thermal conductivity and the electrical resistivity of graphite-containing crucibles shows that these properties significantly depend on the type of the crucible and the zones in different parts of a given crucible. The properties can vary from product to product because of the differences in the compositions and the size fractions of the original raw materials, the postfiring differences in the material, and the structural non-uniformities resulting from compaction. We established the differences in the properties of the graphite-containing crucibles as a function of temperature. Heating the crucibles in an oxidizing atmosphere leads to partial burning-off (depletion) of their main component (graphite) and to a reduction of the thermal and electrical conductivity of the material of the crucibles. The thermal conductivity of the crucibles working in carbon dioxide atmosphere is 5-10% less than that of the crucibles working in argon atmosphere. 4 refs.

**089296 RATIONAL ELECTRIC SCHEDULES FOR ELECTRIC FURNACES USED TO MELT CORUNDUM REFRACTORIES.** Special attention has been paid in recent years to the development of fusion-cast refractories which is mainly due to their unique properties - the absence of penetrable porosity, high structural density, thermomechanical strength, and corrosion resistance. USSR has organized the large-scale production of fusion-cast baddeleyite corundum and corundum refractories. The melting of these refractories is done in electric arc furnaces. The electric melting technology for the baddeleyite-corundum materials has been mastered, but until now we have lacked data on the rational electrical schedules for the process, their relationship with the productivity of the furnace, and the consumption of electricity per ton of melt. To solve these problems we carried out industrial tests. The test method specifies the bath parameters, short circuit and transformer, with simultaneous registration of the technological parameters (furnace output and specific consumption of electricity). 3 refs.

**089297 FORMATION OF THE CRUST ON THE SURFACE OF THE LINING OF MINING AND BENEFICIATION COMBINE PELLETIZING MACHINES.** At present in the USSR most of the iron ore pellets are produced on iron ore pelletizing machines differing both in design and in productivity. The lining service conditions of these heating units differ as the result of the dissimilar technical parameters (mineral composition of the concentrate, basicity of the charge, temperature characteristics of firing), the aerodynamic parameters of the gas passages (filtration and dynamic resistance of the layer of pellets, dust content of the atmosphere), and features of fuel consumption. The investigations conducted show that the greatest increase in lining life may be obtained by the use of refractories and coatings resistant to the action of molten iron silicate materials. Increasing the lining resistance of the high temperature zones makes it possible to reduce down/time by 50-100 h and to obtain savings as the result of the reduction in repairs and additional production of more than 50,000 tons of pellets in a single pelletizing machine. 8 refs.

**089298 INTERACTION OF ZINC WITH THE CERMET INSERTS IN INDUCTION FURNACE LININGS.** In the service of channel induction furnaces convective heat exchange between the induction unit and the bath is very important. If a directed process of heat and mass transfer is absent, then in the melting channel there are formed zones in which the metal temperature is more than  $100^\circ\text{C}$  higher than its temperature in the bath of the electric furnace. For low-melting metals such as zinc this significantly influences the melting process and the condition of the aluminosilicate linings used. Failure of the aluminosilicate lining occurs both as the result of the reduction in its high-temperature strength and from chemical interaction of the refractory with ZnO. The authors developed a method of heating the induction unit lining in a reducing atmosphere of carbon. Commercial carbon is highly effective thermal insulator and the losses of weight in heating to  $500^\circ\text{C}$  do not exceed 3.5%. In the compacted condition the material has a high electrical conductivity and therefore induction heating of the channel occurs. The presence of the cermet insert provides more favorable conditions for service of the furnace channel lining. 10 refs.

**089299 DISCUSSION: PROBLEMS IN THE USE OF TORCH GUNITING FOR REPAIRING THE LINING OF HEATING EQUIPMENT AND PRODUCTION OF BLOCK REFRACTORY PARTS. SELECTION OF COMPOUNDS FOR TORCH GUNITING OF OPEN-HEARTH ROOFS.** Based on the properties of periclase-chromite refractories, which are recommended for open hearth roofs, it is assumed that gunited coatings formed from periclase-chromite compounds would meet the service requirements (high heat resistance and refractoriness, satisfactory porosity, etc.). In conducting the present investigations charges with weight ratios of periclase and chromite of 100:0, 90:10, 80:20, 70:30, 60:40, 30:70, and 0:100 were prepared and also charges based on scrap of used periclase-chromite roof brick with additions of periclase powder in the following weight ratios: 100:0; 90:10; 80:20; 70:30; 60:40. The life of the coatings was 10 heats in comparison with 4-5 heats for a periclase coating. The results of laboratory

and experimental production tests showed the promise of using periclase-chromite compounds for torch guniting of open hearth roofs. 7 refs.

**089302 ANOMALOUS NACHWACHSEN VON KORUND-FEUERBETONEN UND DESSEN VERHINDERUNG.** [Anomalous Swelling of Corundum Refractory Concrete and Its Prevention]. The fact that corundum refractory concretes bonded with high-alumina cements are subject to irreversible swelling is often underestimated. The exact amount of the expansion remains profoundly unknown, considering the type of corundum aggregates, the grain size distribution of the mixture, the type of the high-alumina cement used, the temperature, as well as other factors that may interfere. Obviously, this negative property of the corundum refractory concretes cannot always be eliminated completely. However, provided that a proper refractory concrete composition is adopted, the values of irreversible expansion can be kept low enough to make the service applications feasible to clarify the effects which cause irreversible expansion of alumina refractory concretes experiments were run with refractory concretes incorporating three types of corundum aggregates (bubble alumina, fused alumina and tabular alumina) and six types of high-alumina cements. (Edited author abstract) 12 refs. In German.

**089305 KINETICS OF HYDRATION AND ACTIVITY OF MONOCALCIUM DIALUMINATE AND THE HIGH-ALUMINA CEMENTS BASED ON IT.** In recent years, there has been an abrupt increase in the requirement of high-alumina cements (HAC) for producing concrete lining of thermal units in various industrial sectors. This paper presents the results of systematic laboratory and industrial studies on the activity of HAC obtained by various methods. In order to evaluate the effect of the production method of monocalcium dialuminate  $\text{CaO} \cdot 2\text{Al}_2\text{O}_3(\text{CA}_2)$  on its hydraulic properties, we studied the hydration kinetics of the materials that were synthesized by sintering and melting. The activity of high-alumina cements based on  $\text{CA}_2$  mainly depends on the milling fineness. The specific features of chemical and, consequently, mineralogical composition have a significant effect on the rate of the setting process during the initial period. The type and the quality of the original raw materials used for obtaining clinkers in electric arc furnaces do not significantly affect its quality provided that the required mineralogical composition, proper melting regime, and removal of the detrimental components from the oxide melt are ensured. 12 refs.

Zaldat, G.I. (Ural Scientific-Research Inst, USSR); Kukui, S.M. *Refractories* v 28 n 5-6 May-Jun 1987 p 313-317.

**089306 METAL RESISTANCE OF REFRACTORY CONCRETES BASED ON PHOSPHATE BINDERS.** The authors studied the resistance of fused magnesite, corundum, and quartzite-based materials produced using phosphate binders to molten aluminum and copper. It was established that the materials based on fused magnesite and corundum are most stable in molten aluminum. The materials based on fused magnesite have the maximum resistance to molten copper. 2 refs.

**089308 AUTORADIOGRAPHIC STUDY OF CORROSION OF REFRACTORIES.** In glass-melting furnaces the downward facing surfaces of the refractories are subjected to increased wear as a result of vertical cellular corrosion. A comparative study was made of the character of the interaction between a container-glass melt and a refractory in various sections (the side surface with traditional wear and the horizontal surface facing the glass damaged by the action of vertical cellular corrosion). The autoradiograms and the photomicrography indicate that an intrinsic feature of all refractories, regardless of where they interact with the melt, is that the calcium from the melt penetrates the refractory along the weak links for fused-cast refractories, the glass phase; for sintered refractories, by the binder and the micro- and macrocracks. 4 refs.

## Crystallization

**089309 EFFECT OF THE COOLING RATE OF THE MELT OF THE STRUCTURE OF ELECTROSMELTED FORSTERITE REFRACTORIES.** The cooling rate of the melt and the crystallization conditions are the main factors in the technology of producing fused refractories and they determine the structure of the material. To study the effect of these factors on the structure of fused forsterite, batches based on serpentinites from the Dzhetysayinsk deposits with additions of metallurgical magnesite were melted, followed by cooling at a rate of 100°C/min and quenching in water or oil. Quenching in water obtains crystalline material which contains no glass phase. The development and stabilization of a dendrite structure producing a strengthened interphase bond increases the strength of the refractory product. 2 refs.

Bolotov, Yu.A. (Alma-Ata Energy Inst, USSR). *Refractories* v 28 n 1-2 Jan-Feb 1987 p 85-88.

**089310 MODELING THE CRYSTALLIZATION OF THE GLASSY PHASE OF FUSED BADDELEYITE-CORUNDUM REFRACTORIES.** The glassy phase of baddeleyite corundum refractories containing 33% of  $\text{ZrO}_2$  has been studied by many research workers. To determine the composition of the glass phase of the refractories, 'high-temperature' and 'low-temperature' methods have been used. To obtain specimens using the first method, the refractories were heated to 1300-1700°C. As a result, drops of the glass phase appeared on the surface and these were collected and chemically analyzed. For the second method, selective dissolution of the milled refractory was carried out in 5% HF. In this case, the crystal framework of the refractory was virtually insoluble and the glass phase went into solution. Next, the amount and composition of the phase were determined. The amount of glass phase in the specimens of thin sections of refractories was evaluated using a petrographic method. 5 refs.

Verlotskii, A.A.; Rublevskii, I.P.; Kalinin, V.B.; Lokshina, A.E. *Glass Ceram* v 43 n 11-12 Nov-Dec 1986 p 526-530.

## Deformation

**089311 INVESTIGATING THE DEFORMATION PROPERTIES OF MORTARS.** In this article we present experimental data from an investigation of the deformation of mortars at varying temperatures and loads and make an attempt to describe the creep curves using the theory of thermoviscoelasticity. We studied specimens of chamotte, mullite-siliceous and dinas mortars. The specimens were cast from mortars in molds and dried in a thermostat for 5-6 h at 110°C. The capacity of the mortars to resist significant compression will contribute to the weakening of the annular and axial stresses in the structure. The results of the studies may be used for designing heating equipment. 4 refs.

## Density

**089312 INCREASING THE APPARENT DENSITY OF CAST BADDELEYITE-CORUNDUM PRODUCTS FOR MAKING OPTICAL GLASS.** Apparent density is used as the main characteristics of the case refractories of the baddeleyite-corundum composition. In order to facilitate the production of optical glass, the Podolsk Refractories Factory is manufacturing products corresponding to the BKCh-33 and BKCh-34 grades and having an apparent density not less than 3.4 and 3.6 g/cm<sup>3</sup>, respectively. The experience gained during the service of these products showed that the formation of striae and bubbles becomes intense when the central porous zone of the beam comes into contact with the glass mass. In order to eliminate the shrinkage cavity from the body of the beam and to improve the absolute density of the products, the authors produced experimental castings using a cylindrical riser. 4 refs.

**089313 INCREASING THE DENSITY OF ELECTROMELTED REFRACTORIES USING ELECTROMAGNETIC EFFECT DURING THE PROCESS OF CASTING (POURING) AND CRYSTALLIZATION.** Density is one of the most important technological properties of refractory materials. Application of an electromagnetic field during the process of pouring the melt into the mold and crystallization has a positive effect on the density of filling the molds. In the presence of an electromagnetic field, density increases by 26% on average. 3 refs.

## Doping

**089314 EFFECT OF ANNEALING AND ELECTRON IRRADIATION ON THE STATE OF PARAMAGNETIC CENTERS IN CUBIC BORON NITRIDE.** A study was made of the effect of isothermal annealing and electron irradiation on the EPR spectra of polycrystalline samples of cubic boron nitride. It was found that the nature of the paramagnetic defects is similar in the two cases. It is suggested that the observed EPR signals are caused by annealing-resistant and electron-irradiation-resistant complexes based on nitrogen vacancies and interstitial atoms. In Russian. 9 refs.

**Elasticity** See COKE OVENS—Refractory Materials.

**Erosion** See PROTECTIVE COATINGS—Refractory Materials.

## Eutectics

**089315 FORSTERITE-BADDELEYITE SYSTEM.** A comparison of the experimental and calculated liquidus curves showed that the forsterite-baddeleyite system is fairly well described by a regular-solution model and may be categorized as a simple eutectic system with a eutectic composition of 83.2 mol.% Mg<sub>2</sub>SiO<sub>4</sub> and a melting point of 2038 K. By thermodynamic analysis of the system the existence of two solid-solution ranges - one based on forsterite (up to 1.2 mol.% ZrO<sub>2</sub>) and one based on baddeleyite (up to 63.9 mol.% Mg<sub>2</sub>SiO<sub>4</sub>) - at the eutectic temperature is established. In Russian. 6 refs.

## Failure

**089316 STRESSED AND STRAINED STATE AND FAILURE OF REFRACTORIES UNDER THERMAL ACTION.** Failure of a refractory is a complex irreversible thermally activated process occurring under the action of molten metal or hot gases in which the physical and chemical aspects of failure are closely related, mutually dependent, and mutually strengthen each other. For investigations of the failure process tests of refractory specimens were made on a unit developed by the All-Union Refractory Institute. To evaluate the intensity of failures, visual inspection with a metallographic microscope, determination of the change in the rate of passage of ultrasonic vibrations in the specimens after the tests, and the sonic resonant method were used. The materials tested were periclase, quartz and mullite-corundum. 2 refs.

Kuznetsov, A.T. (All-Union Inst of Refractories, USSR); Kokushkin, I.V.; Senyavin, N.K.; Shershnev, A.A. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 110-114.

**089317 PROCESSES OF THE ACTION OF IRON AND ITS COMPOUNDS ON A REFRACTORY.** Iron and its oxides participate in all processes of failure of the refractory linings of metallurgical equipment. This may be explained by the high thermodynamic activity of iron in both the liquid and solid phase. Based on the temperature conditions of service, equipment in which such action occurs primarily in the solid and highly viscous phase, such as machines and equipment for firing of pellets (temperature in the working space from 800 to 1300°C) and equipment in which the interaction occurs primarily in the liquid phase such as open hearth, double bath, and electric furnaces and oxygen converters (temperature in the melting space 1600-1800°C) are discussed. 10 refs.

Freidenberg, A.S. (Ural Scientific-Research Inst for Ferrous Metallurgy, USSR); Perepelitsyn, V.A. *Refractories* v 28 n 7-8 Jul-Aug 1987 p 465-471.

## Fiber Reinforcement

**089318 THERMAL INSULATION OF THE RISER OF AN ALUMINUM CASTING WITH FIBER MATERIALS.** At present in a number of plants automatic machines are used for casting of aluminum pistons. Thermal insulation of the riser is provided by a sleeve of Marinite thermal insulation material. We have investigated the possibility of production of materials of this type from fibrous components (asbestos, kaolin wool, basaltic fiber, perlite) by methods of pressing with various binders (orthophosphoric acids clay, lime-silica binder). Based on investigations conducted, with phosphate and clay hardening the optimum charge composition must include 28.5% fibrous component, 28.5% perlite, and 14.5% clay. The fibrous constituent must have fibers with a length of not more than 0.5 mm to obtain a sufficiently good part surface in pressing to eliminate erosive action of

the solidifying metal. The fibers serve as a reinforcing component providing the heat resistance and strength of the material. 2 refs.

Efimov, G.V. (Acad of Sciences of the USSR, USSR). *Refractories* v 28 n 5-6 May-Jun 1987 p 295-298.

## Fireclay

**089319 CONCENTRATION OF MULLITE AND THE DEGREE OF CONVERSION IN FIRECLAY FIRED AT 1100°C.** The authors studied the effectiveness of various complex additives on mullite formation in fireclay. The chemical composition of the clay was % (by weight): SiO<sub>2</sub> 68.70, Al<sub>2</sub>O<sub>3</sub> 19.80, Fe<sub>2</sub>O<sub>3</sub> 0.99, TiO<sub>2</sub> 1.20, CaO 0.26, MgO 0.21. The additives consisted of oxyfluoride fused flux (not less than 90% CaF<sub>2</sub>) and the eutectic mixture of CaF<sub>2</sub>+MgF<sub>2</sub> obtained by fusing the original components at 1100°C. Composition of the aluminosilicate mass, including the chamotte, the fireclay, and the additive of oxyfluoride flux is recommended for making the channel elements for lining the induction units of furnaces for remelting cathode zinc. 25 refs.

Snegirev, A.I. (Acad of Sciences of the USSR, USSR); Gimpelman, E.Ya.; Pivovarov, V.I.; Zholobova, L.S.; Fotiev, A.A. *Refractories* v 28 n 9-10 Sep-Oct 1987 p 565-570.

**Firing** See Also KILNS—Simulation; KILNS—Temperature Control.

**089320 TURBULENT DIFFUSION IN THE FLAME OF A ROTARY KILN.** During firing of refractory materials in rotary kilns, combustion of the fuel occurs by mixing with the oxidizer in a turbulent diffusion flame with participation of solid particles in the form of dust of the material being fired. The process of mixing the fuel with the oxidizer is determined by turbulent diffusion. 13 refs.

Strekotin, V.V. (Eastern Refractory Inst, USSR); Telegin, A.A.; Lisin, F.N.; Malysheva, O.I. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 47-51.

**089321 USE OF RAMAN SPECTROSCOPY IN A COMPLEX INVESTIGATION OF THE FIRING OF SERPENTINITES.** In the present work during a study of the firing behavior of serpentinites from the Dzhetysay deposits an attempt was made to carry out the analysis using the method of Raman spectroscopy (combined scatter - KRS). The Raman method of measurement revealed no change in the phase composition of the material fired at above 1373°K right up to the melting point. Thus, the use of the Raman microscopic method for studying the behavior of Dzhetysay serpentinites during heating established that the mineral formation after decomposition of the serpentinites commences with the separation of the structures of clinostatite, then enstatite and forsterite, and furthermore we established the low-temperature synthesis of these monomineral phases which researchers had previously not established. We also revealed monomineral complex consisting of a mechanical mixture of clinostatite, enstatite, and forsterite, which are not registered by the conventional methods. 6 refs.

Ashimov, U.B. (Alma-Atinsk Inst of Power Engineering, USSR); Arymbaev, O.Z.; Bolotov, Yu.A.; Zaretskaya, N.P. *Refractories* v 28 n 3-4 Mar-Apr 1987 p 149-153.

**089322 SHAFT OVEN FOR HEATING FINELY DIVIDED MATERIALS.** A shaft oven has been developed to dry and fire various powders, including powders with high water contents, in continuous operation at temperatures up to 1200°C. We give some design and working characteristics of the apparatus used for decarbonization and high-temperature firing in the production

of high-purity substances and reagents, in particular, rare-earth oxides. There was virtually no loss of the fired material. 4 refs.

Glazachev, V.S. (Automatic Instruments Research Inst, USSR); Prozorov, E.N. *Refractories* v 28 n 5-6 May-Jun 1987 p 270-271.

**089323 PROPERTIES AND BEHAVIOR OF PERICLASE-CARBON SYSTEMS DURING THE FIRING PROCESS UNDER OXIDIZING CONDITIONS.** In order to define the physicochemical processes occurring when forming periclase-carbon concrete products that are intended for lining the walls of electric steelmaking furnaces and converters, we studied the properties of fine-grained composites after firing in air at 1000 and 1650°C. The results show that it is not advisable to introduce more than 20% graphite into the composition of the periclase-carbon refractories because, in this case, the strength of the products decreases significantly and their porosity increases. The temperature corresponding to the beginning of carbon depletion does not depend on its content in the body and amounts to 550-560°C. Caustic periclase introduced for achieving additional low-temperature densification of the structure with reduced degree of carbon depletion did not give the expected effect: the temperature at which carbon depletion begins does not depend on its content in the body.

Ivashchenko, L.V. (L.I. Brezhnev Dnepropetrovsk Metallurgical Inst, USSR); Romanoyskii, L.B.; Shevchenko, G.I.; Khoroshayin, L.B.; Perepelitsyn, V.A.; Popova, V.I. *Refractories* v 28 n 5-6 May-Jun 1987 p 301-305.

**089324 VAPOR-PHASE RECRYSTALLIZATION (REDEPOSITION) PROCESSES IN PERICLASE-CARBON PRODUCTS.** The recrystallization process of periclase and silicates from a vapor phase is observed when firing the periclase-graphite products in air at 1710-1720°C. We studied the mechanism of vapor-phase recrystallization of periclase and forsterite in the periclase-carbon products. The formation of secondary crystals of periclase and forsterite occurs from the gaseous phase simultaneously with their crystallization in the form of filamentary and dendritic crystals in the developed cavity and with recrystallization of isometric periclase. 8 refs.

**089325 BURNING CLINKER FOR HIGH-ALUMINA CEMENT IN A ROTARY KILN.** We prepared clinker for high-alumina cement in a rotary kiln and determined the material balance in firing when preparing the raw mixtures with two methods: granulation in a plate granulator and briquetting on a roller press. It is shown that much less dust removal (4%) is ensured by firing the briquets obtained on the roller press. The aluminous cement obtained with this technology has a high graded strength. 3 refs.

**089326 MATHEMATICAL MODEL OF HEATING OF THE MATERIAL IN A LAYER WITH OCCURRENCE OF PROCESSES OF ITS THERMAL DECOMPOSITION.** Shaft kilns are used for firing refractory materials and are equipped with layer heat exchangers. Heating is accompanied by endothermic reactions of decomposition, which significantly complicate thermal calculations. This article presents a mathematical model of heating of the material in a layer in the presence of a decomposition reaction taking into consideration the determining factors of the decomposition and based on a mathematical description of the kinetics of the decomposition reaction and of the processes of heat and mass exchange in the material of the layer. The model describes nonsteady heating of a stationary layer of material and

may be used for computerized thermal calculations of heat exchange equipment with crosswise and countercurrent flows. 5 refs.

## Fracture

**089327 STRUCTURE AND FRACTURE OF CORUNDUM-MULLITE REFRACTORIES.** Introducing mullite-containing components and additives initiating the formation of secondary mullite at the active surfaces of corundum crystals into corundum bodies changes the structure and the nature of resistance to crack propagation during mechanical loading owing to the increased duration of delayed fracture. The thermal shock resistance increases due to increased limiting deformation and work of fracture. The highly developed contact surface between corundum and mullite through the fine-grained matrix phase containing microcracks is a characteristic feature of the structure. 10 refs.

Nemets, I.I. (I.A. Grishmanov Belgorodsk Technological Inst of Building Materials, USSR); Gvozdi, V.S.; Belik, Ya.G. *Refractories* v 28 n 9-10 Sep-Oct 1987 p 555-558.

## Heat Resistance

**089328 HEAT RESISTANCE OF FUSED AND CAST BADDELEYITE-CORUNDUM REFRACTORIES.** This article presents certain results of investigation of the heat resistance of BKCh-33 baddeleyite-corundum parts. The heat resistance of specimens from different zones of BKCh-33 production parts was investigated by the method of radial thermal flow. Specimens the microstructure of which is distinguished by the minimum quantity of defects, a fine crystalline structure of the products of combined crystallization of baddeleyite and corundum, and uniform distribution of glassy phase have the highest heat resistance, which should be taken into consideration in the production of refractories in industry. 9 refs.

## Heat Transfer

**089330 TEMPERATURE, HEAT FLUX, AND GROWTH KINETICS FOR A METAL CRUST ON A REFRACTORY.** The assumptions of ideal thermal contact and semiinfinite refractory lining have been used in an analytic solution for the crust kinetics. The solution has an advantage over a numerical one as it enables one to analyze the effects of the various physical factors. The solution has been obtained in terms of dimensionless variables, particularly as a function of the unique dimensionless parameter, which enables one to evaluate crustal development for any physical conditions. Further improvement to the solution can be obtained by incorporating the nonideal refractory-liquid contact. 2 refs.

Kuznetsov, A.T. (All-Union Refractories Inst, USSR); Magel, R.K.; Sibikin, A.B. *Refractories* v 28 n 5-6 May-Jun 1987 p 272-277.

**089331 EMISSIVITY OF ALUMINOSILICATE REFRACTORIES.** Experimental data was obtained on the dependence of the emissivity of refractories on temperature and chemical composition. The article reports results of a study of the integral normal emissivity of different grades of aluminosilicate refractories in relation to their chemical composition and temperature during heating in air in the temperature range 600-2100°K and during heating in vacuum, with a vacuum pressure to  $10^{-3}$  mm Hg, in the temperature range 600-1800°K. The refractory specimens were bars measuring  $35 \times 35 \times 3$  mm or  $40 \times 40 \times 5$  mm, depending on the grade of refractory. The roughness parameters of the specimens were measured on a MIS-11 binary microscope. (Edited author abstract) 2 refs.

## Impurities

**089332 INFLUENCE OF STRUCTURAL DEFECTS ON THE ELECTRONIC PROPERTIES OF INTERSTITIAL ALLOYS - II. METAL SUBSTITUTIONAL IMPURITIES.** The LMT0-Green's function method is used for the study of the electronic structure of refractory interstitial alloys (TiC, TiN, VC, NbC) containing isolated substitutional impurities in the metal sublattice. The impurities considered are 3d- and some of the 4d-metals. The presence of LDOS resonances in the region of the matrix DOS minimum has been revealed for elements of the VIa-VIIa subgroups. Self-consistent spin-polarized calculations provide estimates of the values of the local magnetic moments for the above impurities. The special features of metal impurity electron distributions with 'anomalous' alloying are discussed for TiC-Mo, TiN-Mo, TiN-Ni, wherein Mo and Ni atoms have been implanted at sites of the non-metal sublattice. The calculational results are compared with available X-ray emission spectra of the alloys  $Ti_x V_y C_z$  and  $Ti_x Nb_y C_z$ . (Author abstract) 20 refs.

## Machining

**089333 HARD-PART MACHINING: A CERAMIC SUCCESS STORY.** Hard-part machining (HPM), simply put, is the machining of extremely hard workpieces using ceramic inserts. It is not a new concept, but its success rate has improved dramatically over the past ten years with the emergence of uniform ceramic inserts. HPM requires less processing time, reduces capital investment, and generally improves end product quality and durability. Uniform ceramic consistency in chemical content, metallurgical and physical properties, and dimensional control makes HPM performance as predictable as that of any other mechanical process.

**089334 SINTERING BEHAVIOR OF ULTRAFINE MAGNESIA PREPARED BY CHEMICAL VAPOR REACTION.** Sintering behavior of ultrafine CVD-MgO, which is characterized by a high purity and nonagglomeration, was studied at temperatures from 600°C to 1500°C in air with emphasis on the particle size effect. The sinterability increased remarkably with decreasing the particle sizes in the starting powders. Owing to nonagglomeration, CVD-MgO showed a higher sinterability than those of the powders produced by solid-state reactions. (Edited author abstract) 13 refs.

Kato, Akio (Kyushu Univ, Jpn); Toda, Yasuhiko. *Mem Fac Eng Kyushu Univ* v 47 n 2 Jun 1987 p 135-143.

**089335 OBTAINING FUSED PERICLASE IN THE OKB-955N ORE-THERMIC FURNACE WITH A TRIANGULAR BATH.** We identified the factors influencing the process of forming the nonmeltable heat-insulating layers of the block during the melting of brucite raw materials in an ore-thermic furnace designated OKB-955N. A furnace was proposed with a bath in the form of a triangular, truncated pyramid with rounded edges, facilitating a considerable reduction in the thickness of the nonmelting heat-insulating layer, especially the skin of the block, the specific consumption of raw materials and the volume of manual and mechanical handling operations, and also giving some improvement in the quality of the periclase. The highest cost-benefit factors for operating the furnaces are obtained by combining the triangular baths with a forced melting cycle. The parameters for a high-capacity furnace with a triangular bath were examined. 4 refs.

**089339 DIE SPIRZHAFTUNG BASISCHER FEUERFESTER PFLEGEMASSEN.** [Adherence of Basic Refractory Maintenance Mixes]. The adherence of a gunning mix is determined by its plasticity. This results from the rheological properties of the fines portion of the mix mixed with water. The viscosity of aqueous suspensions of sintered magnesite fines was determined at 30, 50, 70 and 90°C by means of a rotational viscometer. Besides, the influences of the fineness of grinding, and of different binder additives (neutral and alkaline Na-silicate, Na-polyphosphate) were included in the investigations. High yield points are already formed in a pure MgO suspension within a few minutes. They are enhanced by higher temperatures, finer grain size distributions of the fines, and by sodium silicate additions. (Author abstract) 8 refs. In German and English.

**089344 EVALUATION OF THE SLAG RESISTANCE OF RESIN-BONDED CONVERTER REFRACTORIES.** Slag erosion of converter refractories occurs due to a physicochemical interaction involving impregnation of the refractory material with slag and chemical dissolution with the formation of refractory compounds. This paper deals with a study of the failure mechanism of periclase converter refractories produced using a resinous binder and presents a rapid method of evaluating slag resistance based on data on the flow rate of the slags. Experimental evaluation of the results of thermodynamic analysis was carried out based on a study of the state of the refractory specimens after impregnation with a basic slag at 1500-1620°C. The slag composition was 13% Al<sub>2</sub>O<sub>3</sub>, 10% SiO<sub>2</sub>, 42% CaO, 4% MgO, 7% P<sub>2</sub>O<sub>5</sub>, 3% MnO, and 21% FeO. 7 refs.

**089346 DETERMINATION OF THE WEIGHT PERCENT OF CHROMIUM OXIDE IN MAGNESIA CHROME-CONTAINING MATERIALS AND PARTS ON A BARS-3 INSTRUMENT.** The method developed is designed for rapid production inspection of production in the range of 8-60% Cr<sub>2</sub>O<sub>3</sub> and of finished production in the 10-30% range. The time for analysis of a single sample, including preparation, is 4-5 min. The actual spread obtained between the results of two parallel measurements is 0.3% with Cr<sub>2</sub>O<sub>3</sub> from 8 to 30 wt.% and 0.8% with Cr<sub>2</sub>O<sub>3</sub> from 30 to 60 wt.%. The method, which is designed for production control, has been certified in accordance with the plant standard. At present work is being done in Magnesite Combine on preparation for certification of a method of measurement of the weight percent of calcium oxide in magnesite powders and of iron oxide in powders with the addition of siderite on the BARS-3 instrument.

Bibaev, V.M. (Magnesite Combine); Krasnova, O.V. *Refractories* v 28 n 3-4 Mar-Apr 1987 p 162-163.

**089347 UNFIRED PERICLASE PLATES FOR STEEL TEEMING LADLE SLIDE GATES.** Because of their low heat resistance fired plates crack after teeming of a single heat and become unsuitable for teeming of a second heat. To eliminate these disadvantages a method for unfired periclase plates with a phosphate binder has been developed. Powdered lignosulfonate is used as the organic plasticizer and inhibitor reducing the rate of interaction of the polyphosphate with MgO and CaO in the stage of preparation of the mixture and the hardening green compact in pressing. To increase the strength of the freshly pressed compact, caustic magnesite powder is also added. 6 refs.

Simonov, K.V. (Magnesite Combine, USSR); Mezentsev, E.P.; Bibaev, V.M. *Refractories* v 28 n 7-8 Jul-Aug 1987 p 451-455.

**089348 ACTIVATED SINTERING OF MgO-CaO SERIES.** The high purity natural MgO-CaO materials, although difficult to sinter, are important lining materials for use in BOF and secondary steelmaking. A study on activated sintering of the MgO-CaO series was carried out with high purity natural carbonates as starting materials. It was found that the densification processes would be practically complete when heating the calcined hydrates at 1400°C. (Edited author abstract) 9 refs.

Li Guangping (Luoyang Inst of Refractories Research, Luoyang, China). *Sci Sintering* v 19 n 3 Sep 1987 p 167-178.

**089349 PERICLASE POWDERS ALLOYED WITH CARBON.** Carbon alloying of various periclase powders in an atmosphere of propane-butane at 800°C (0.5-h soaking) facilitates the incorporation in their composition of up to 4.3% C. During heating in air the carbon from the alloyed powders burns out at 480-840°C. Carbon alloying of periclase powders reduces the hydration degree. 2 refs.

Khoroshavin, L.B. (East Inst of Refractories, USSR); Perepelitsyn, V.A. *Refractories* v 28 n 9-10 Sep-Oct 1987 p 495-498.

**089350 PHASE TRANSFORMATIONS IN PERICLASE-CARBON REFRACTORIES DURING OXIDATION-REDUCTION REACTIONS OF THE COMPONENTS.** Under the conditions of converter steelmaking, the main components of the periclase-carbon refractories, viz., magnesium oxide and carbon, are thermodynamically incompatible. Thus, oxidation-reduction reactions of the oxide (periclase and graphite ash) and the carbonaceous constituents lead to a decrease of the weight content of MgO and to an increased content of the silicates. Reduction of the compounds of iron and silicon contained in periclase and graphite is accompanied by the formation of a condensed metallic iron- and silicon-bearing phase that is sensitive to the changes occurring in the oxidation potential and temperature at the working surface. 14 refs.

**089351 CREEP BEHAVIOUR OF NATURAL DOLOMITIC CARBON-BONDED MAGNESITE BRICKS.** Creep-rate measurements have been carried out on carbon-bonded bricks containing high magnesia synthetic grains or natural dolomitic magnesite clinkers. In spite of the fact that  $\text{Fe}_2\text{O}_3$  is reduced during heating, creep behaviour of bricks containing natural dolomite was found to be comparable to that of bricks containing high purity magnesia synthetic grains. However, the creep behaviour of these carbon-bonded bricks is better than that of fired magnesia bricks. (Edited author abstract) 6 refs.

## Manufacture

**089352 MODERNISATION AT REFRATECHNIK.** Refratchnik produces refractory materials, both shaped and unshaped products for the cement, iron and steel and non-ferrous metal industries. The process stages of setting, firing, unloading, palletizing and packaging have been automated. Its main specialization, is in refractory products for the cement industry. 85% of the products are exported to over 70 countries.

Anon. *Refract J* v 62 n 5 Sep-Oct 1987 p 10-14.

## Marketing See Also CERAMIC PLANTS—Reviews.

**089353 REFRACTORY RAW MATERIALS IN 1992.** The refractories industry is one of the most conservative and cautious with respect to changes and innovations, particularly in raw materials. Whereas monolithic specialty refractories will gradually replace shapes in many applications, it is quite probable that in 1992 the major refractory raw materials in the Western World will continue to be bauxite, magnesite, clays/kaolins, and chromite. The proportion of chromite used will likely diminish gradually because of environmental factors. 16 refs.

McCracken, William H. (F&S Alloys and Minerals Corp, Pittsburgh, PA, USA). *Am Ceram Soc Bull* v 67 n 7 Jul 1988 p 1155-1157.

**089354 RAW-MATERIAL IMPACTS ON THE REFRACTORIES INDUSTRY.** The steel industry is the predominant end user of refractories worldwide. Anticipated changes and the foreseen restructuring that certain traditional steel producing regions will undergo, as well as certain trends in steelmaking practices, will thus affect the refractories industry. Trends in consumption of raw materials such as dead-burned magnesia, chromite, and calcined bauxite also will have major impacts on the industry.

Kandianis, Fotis (Possehl Inc, Paramus, NJ, USA). *Am Ceram Soc Bull* v 67 n 7 Jul 1988 p 1158-1160.

## 089355 TRENDS IN THE EUROPEAN REFRAC-

**TORIES INDUSTRY.** The Western European refractories community has problems due to the declining steel industry. However, there are definite opportunities available if refractories companies are prepared to think more in 'money values' and less in 'tonnage volume'.

Longin, Hellmut (Radex-Heraklith Industriebeteiligungs AG, Vienna, Aust). *Am Ceram Soc Bull* v 67 n 7 Jul 1988 p 1161-1162.

**089356 OUTLOOK FOR THE REFRACTORIES INDUSTRY IN JAPAN.** The iron and steel industries are trying to overcome the international competition by improving quality and increasing the ratio of high-value-added products from a technical viewpoint. This industry suffers from excess manufacturing capacity. As a result, overall refractories consumption also has decreased. The number and types of refractories should increase in response to the diversifying needs of users. This will require refractories manufacturers to improve process, evaluation, and quality-control technologies. 16 Refs.

**089357 EFFECT OF COMPOSITION AND THE AMOUNT OF SPHERICAL-PARTICLE ALUMINOUS FILLERS ON THE DENSITY AND STRENGTH OF CORUNDUM REFRACTORIES.** To find the effect of the batch composition on the compressive strength and density of the composites, a simplex-grid method of experimental planning was used. The calculations were done using a program which we had improved. Mathematical models were obtained in the form of fourth-degree polynomials. It is shown that the strength of the composites is greater the smaller the size of the particles of filler. 2 refs.

Suvorov, S.A. (Lensovet Leningrad Technological Inst, USSR); Kapustina, S.N.; Fishcher, V.N.; Tarnavskaya, I.A. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 77-82.

**089358 ROLE OF STRUCTURE AND CAPACITY FOR ENERGY ABSORPTION IN INCREASING THE STRENGTH AND CRACK RESISTANCE OF REFRACTORY CERAMICS.** The structure of refractory ceramics in the main predetermines their strength. If the technology ensures consistency of density in the material then with an increase in the grain sizes (d, m) of the structure there is a reduction in strength ( $\sigma_{\text{rup}}$ , N/mm<sup>2</sup>). As regards the crack resistance ( $K_{1c}$ , N/mm<sup>3/2</sup>) depending on the characteristics through which it is expressed, the role of grain size in altering  $K_{1c}$  is not always clearly seen. This article analyzes the influence on the magnitude  $\sigma_{\text{rup}}$  and  $K_{1c}$  of the structure made up of grains having irregular size and shapes, and also the structure which possesses the capacity to absorb energy of deformation. It is shown how the characteristics of strength and crack resistance can be predicted and improved. 23 refs.

Prantskyavichyus, G.A. (Acad of Sciences of the Lithuanian SSR, USSR). *Refractories* v 28 n 7-8 Jul-Aug 1987 p 362-368.

**089359 STRUCTURAL-MECHANICAL PROPERTIES OF CORUNDUM BODIES CONTAINING A POROUS FILLER.** The authors studied the structural-mechanical properties of granular corundum bodies in relation to the form, amount of additives consisting of surface active substances, and the type of porous filler. A positive influence on the forming properties of the bodies based on spherical corundum and porous corundum briquet is exerted by the incorporation of technical lignosulfonate. It is advantageous to use 0.05% solution for the spherical corundum and 2% solution for the briquet. An addition of GKZh-11 in amounts of 0.05% is desirable only for bodies based on spherical corundum.

The addition of these agents increases the plasticity of the bodies on account of reducing the internal friction between the particles. 17 refs.

Degtyareva, E.V. (Kharkov Komsomol Automobile Road Inst of the Ukraine, USSR); Sandutsa, T.M. *Refractories* v 28 n 7-8 Jul-Aug 1987 p 430-433.

**089360 INFLUENCE OF THE TYPE OF ALUMINA AND ADDITIVES ON THE PROPERTIES OF CORUNDUM HEAT-INSULATING REFRACTORY.** The authors show the advantage of using as the bonding part of the batch finely milled and unfired alumina grade G-00, and as the filler - unmilled alumina GK. By varying the concentrations and composition of the additives, it is possible to obtain corundum lightweight refractories with densities of 0.75-1.1 g/cm<sup>3</sup> and compressive strengths of 2-10 N/mm<sup>2</sup>. With an increase in the firing temperature the apparent density and strengths increase, and at 1780°C their values come within the range of 1.0-1.35 g/cm<sup>3</sup> and 5-25 N/mm<sup>2</sup>. In order to reduce the after-contraction of the goods fired at 1750°C it is desirable to use  $\text{Cr}_2\text{O}_3$  as additive. To increase the strength after firing at 1780°C MgO should be used. 5 refs.

Degtyareva, E.V. (Kharkov Komsomol Ukraine Automobile Road Inst, USSR); Sandutsa, T.M.; Pisareva, N.V. *Refractories* v 28 n 9-10 Sep-Oct 1987 p 475-478.

**089361 FRACTURE MEASUREMENTS OF REFRACTORIES: PAST, PRESENT, AND FUTURE.** A review of the methods used for testing of refractories is given. The development of the work-of-fracture test and its extensive application to the microstructural design of refractories has been accompanied by an increasing interest in the application of fracture-mechanics techniques to structural ceramics such as SiC, Si<sub>3</sub>N<sub>4</sub>, SiAlON, etc. The successful application of the work-of-fracture test to refractories has led to the application of other types of fracture mechanics test to refractories, too. These tests usually consider the parameter known as the stress intensity in the opening mode. 17 Refs.

Bradt, Richard C. (Univ of Washington, Seattle, WA, USA). *Am Ceram Soc Bull* v 67 n 7 Jul 1988 p 1176-1178.

## Melting

**089362 MEASUREMENT OF THE MELTING POINT OF REFRACTORY MATERIALS BY LASER SURFACE HEATING.** An automated setup for determining the melting point of refractory materials is described. The method involves heating of the surface of a sample mounted in a high-pressure chamber with a laser beam and monitoring the temperature of the heated surface with a two-wavelength pyrometer. The melting and freezing points are then determined, as in conventional thermal analysis, from the plateau in the heating and cooling curves. Results are presented for zirconium and sintered alumina which are in agreement with literature data and thus demonstrate the usefulness of the technique. (Author abstract) 2 refs.

## Microanalysis See MICROANALYSIS—Applications.

**Microstructure See Also BASIC OXYGEN CONVERTERS—Refractory Materials.**

**089363 SCANNING ELECTRON MICROSCOPY OF INDUSTRIAL LOW-FLUX DOLOMITE REFRACTORY CLINKERS.** Microstructural features of the industrial low-flux dolomite refractory clinkers produced in a coal-fired rotary kiln were investigated by scanning electron microscopy combined with energy-dispersive X-ray spectroscopy. SEM micrographs of polished sections of an unhydrated clinker indicated that the impurity phase, which is located between periclase and lime grains, has a glassy appearance and occasionally contains dicalcium silicate in the form of rods; most of the silicon, aluminium and iron concentrates in the impurity

phase in which CaO content is high and MgO is low. The impurity phase on the surface of the clinkers has a marked effect on the enhancement of hydration resistance. Several microstructural features are reported and discussed. (Author abstract) 2 refs.

## Nondestructive Examination

**089364 NONDESTRUCTIVE RADIOWAVE METHOD OF INSPECTION AND ITS ROLE IN INCREASING PRODUCT QUALITY.** This article gives an analysis and a basis for use of nondestructive inspection of refractory part quality by measurement of their dielectric parameters by a radiowave method for evaluation of the effectiveness of functioning of a composite system of product quality control and development of measures for increasing quality. The use of the radiowave nondestructive testing method makes it possible to activate purposeful work on increasing the quality of refractory parts and to accomplish 100% inspection for critical parts. The instruments for making the measurements may be assembled on the module principle from standard general purpose elements and units mass produced by industry. Sometimes it is desirable to develop specialized measuring instruments oriented toward solution of specific and narrower problems of nondestructive and production testing. The production of such specialized inspection instruments may be organized centrally in the subindustry, using a standard element base. 21 refs.

Sloushch, V.G. (All-Union Refractory Inst, USSR). *Refractories* v 28 n 3-4 Mar-Apr 1987 p 158-162.

**089365 DEFECT DETECTION IN REFRACTORIES USING THE RADIATION METHOD.** Radiation methods are useful for detecting hidden defects in refractories (large pores and cavities) with minimum dimensions of 2.5-3% of the size of the article in the direction of radiation. Overpressing and thermal cracks are detected with openings of 0.15 mm or more and a depth of spread of not less than 10-15 mm. The main parameters of radiation methods for checking refractories are the supply voltage to the x-ray tube, the distance from the source of radiation to the test object and the length of the control section. 7 refs.

Nyun'kin, V.V. (All-Union Inst of Refractories, USSR); Rapoport, Yu.M.; Yablonik, L.M. *Refractories* v 28 n 7-8 Jul-Aug 1987 p 425-429.

**089366 NONDESTRUCTIVE ACOUSTIC SONIC METHOD OF INSPECTION FOR CERTIFICATION OF FINISHED REFRACTORY PARTS.** A nondestructive method of inspection of finished refractory parts was developed by the All-Union Institute for Refractories. As a result an interrelationship between resonant frequency and open porosity apparent density, and compressive strength was established. Regression equations were derived for open porosity, apparent density, and compressive strength of types ShKU-13, ShKU-15, ShKU-16, ShKU-38, and ShA-5 ladle parts. Nomograms were constructed. 8 refs.

## Optical Properties

**089367 BIDIRECTIONAL REFLECTING PROPERTIES OF CORUNDUM REFRACTORY.** This article deals with an experimental investigation of the reflecting properties of industrial corundum in the IR spectrum both at room temperatures and when heated to 1500°K with subsequent cooling in air. The spectral relationship with the coefficients of reflection for these materials was

obtained from spectrophotometric measurements. Heating of the specimens was carried out by focusing the thermal radiation of an optical furnace. The chemical composition of the refractories was Al<sub>2</sub>O<sub>3</sub> 97, TiO<sub>2</sub> 1.5, SiO<sub>2</sub> 0.5, Fe<sub>2</sub>O<sub>3</sub> 0.1. 3 refs.

Zapechnikov, V.N. (Moscow Evening Metallurgical Inst, USSR); Pushkin, V.T.; Averkov, E.I.; Zen'kovskii, A.G. *Refractories* v 28 n 9-10 Sep-Oct 1987 p 571-573.

## Oxidation

**089368 APPRAISEMENT OF SiC OXIDATION PROTECTION OF ALUMINA-GRAPHITE REFRACTORIES: II - OXIDATION BETWEEN 1 Atm. AND 10<sup>-10.5</sup> Atm.** Six alumina-graphite samples containing SiC or Si or both were oxidized at 1400°C in O<sub>2</sub>, air or CO-CO<sub>2</sub> mixtures corresponding to oxygen pressures between 1 atm and 10<sup>-10.5</sup> atm and their behavior compared with that of a sample containing no addition. Thermogravimetric and quantitative X-ray diffraction show that if SiC protection is effective at low oxygen pressure, it is because the formation of silica is spatially dissociated from the SiC oxidation. The first stage of the reaction drives off SiO<sub>2</sub> leaving the SiC surface accessible to gas. The same is true for Si. This silica production, first vitreous and then transforming into cristobalite, leads to mullite formation at the corundum grain surface or deep in the alumina formed from the bauxite. Thermodynamic calculations show that a significant equilibrium shift takes place in the oxidation reaction of the silicon carbide and the silicon. (Edited author abstract) 9 refs.

Georges, A. (CNRS, Vandoeuvre les Nancy, Fr); Jeannot, F.; Gleitzer, C.; Tassot, P.; Guenard, C. *Br Ceram Trans J* v 86 n 5 1987 p 146-149.

**089369 MECANISMES D'OXYDATION DES REFRACTAIRES DU TYPE ALUMINE - GRAPHITE - SiC.** [Mechanisms of the Oxidation of Alumina-Graphite-SiC-Type Refractories]. The bricks made of alumina, graphite and SiC (AGS) are used at the present time in the coatings of torpedo for the pig iron treatment and transport. The SiC and silicon additions aim to protect the graphite by delaying its oxidation. The present study has investigated the kinetics and mechanisms of oxidation in an oxidizing atmosphere: air, CO<sub>2</sub>, O<sub>2</sub> and oxido-reducing: CO-CO<sub>2</sub> mixtures with 25 to 90% CO, for 6 different brick samples from 3 suppliers. A comparison of the products shows the following: from the binding material pyrolysis, one quality stands out with a less reactive carbon; the corundum-based refractories behave better toward oxidation than the bauxite-based ones; and silicon is not the most determinant component as regards the corrosion by gases; the origin (and hence the nature and characteristics) of SiC is preponderant, at least up to 1400°C; one sample is, in all departments, better than the other, and this has been confirmed during industrial use. (Edited author abstract) 8 refs. In French.

**089372 REFRACTORIES HfC AND HfN - A SURVEY. III: CEMENTED CARBIDES AND COATINGS.** In the first part of this study the physical properties of the refractories HfC and HfN were summarized from data given in the literature. The second part of the study was extended to cover their phase relationships with other carbides and nitrides of the Groups IV to VI, while the third part published in this issue deals with their use in cemented carbides and as hard coatings. The most important development was the addition of TiC to allow cutting speeds to be raised. This was followed by the addition of TaC. In parallel with alloying development in cemented carbides, much work has been done to reduce both the grain size and the residual porosity as they affect toughness and also the wear resistance. (Author abstract)

**089373 APPARATUS FOR DETERMINING THE THERMOPHYSICAL CHARACTERISTICS OF REFRACTORIES BASED ON AUTOMATIC PROCESSING OF THE EXPERIMENTAL RESULTS.** Two methods are commonly employed for determining the thermophysical properties of refractories: the stationary (steady-state) method using a plate specimen and the nonstationary method using a heated wire. However, certain inherent shortcomings restrict the field of their application. It is possible to overcome these shortcomings using the method of constant power source that was developed at the Laboratory of Heat Physics, Institute of Applied Physics, Academy of Sciences of the Belorussian SSR. The method involves specimen heating using a flat heating element supplied with a constant electrical power and recording the temperature changes in the zone of the heating element and in the specimen at a specified distance from the heating element. The advantages of this method include simplicity in assigning the boundary conditions, completeness of determining the thermophysical properties, and the possibility of carrying out the measurements without a standard (reference) specimen. The signals of the differential thermocouples are amplified transformed into binary-decimal code by the analog-to-digital converter. The input device accomplishes communication of the analog-to-digital converter with the microcalculator and controls the operation of the microcalculator. 8 refs.

## Protective Coatings

**089374 STUDY OF PROTECTIVE PLASMA COATINGS.** One method of improving the service life of refractories is to employ protective coatings that are capable of improving their corrosion and erosion resistance. In this work, plasma coatings were sprayed onto substrates made from chamotte, periclase, corundum, graphite, and quartz glass. Electrocorundum, a mixture of corundum and quartz glass, a mixture of corundum and zirconium dioxide, and zirconium dioxide (fused, calcium oxide stabilized) were used as coatings. Plasma coating of the specimens improves some important service characteristics such as slag resistance and gas permeability. 5 refs.

**089375 CHEMICAL AND MINERALOGICAL EXAMINATION OF A  $4\text{Cr}_2\text{O}_3\cdot\text{MgO}$  COATING APPLIED TO A BLOATING FIRECLAY BRICK.** A basic oxide coating has been applied to the working face of a bloating fireclay ladle brick to increase chemical resistance to a basic steelmaking slag. The expansion characteristics of various  $\text{Cr}_2\text{O}_3$  and  $\text{MgO}$  coating mixtures have been measured with a 4:1 molar ratio  $\text{Cr}_2\text{O}_3$  to  $\text{MgO}$  being most compatible with the refractory over 25-1450°C. Evidence of a reaction to form a chromium-rich layer is presented and associated mineralogical changes in the parent refractory are described. It is postulated that this increase in basicity should reduce refractory corrosion at the slag-refractory-gas interface. (Author abstract) 18 refs.

## Research

**089379 APPLICATION OF REFRACTORIES: A COLLECTION OF PAPERS PRESENTED AT THE 89TH ANNUAL MEETING OF THE REFRACTORIES DIVISION.** This proceedings contains 16 papers on the main subject of the refractory materials. Main topics discussed are: alumina refractories performance; corrosion resistance of refractories, especially against molten glass attacks; refractories in the process of aluminum metallurgy; kiln lining; steel ladle lining; quality assurance and control in production of refractory materials. Also, the process control and personnel training for application of statistical methods in process and quality control are discussed. Technical and professional papers from this conference are indexed and abstracted from the conference code no. 11016 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**089380 ANDALUSITE.** Andalusite is a member of the sillimanite group of minerals which comprise andalusite, sillimanite and kyanite. All three minerals have the same chemical composition ( $\text{Al}_2\text{O}_3\cdot\text{SiO}_2$ ) but possess different crystal structures and differ slightly in their physical properties. In this contributed article the author examines the properties, occurrence, production and markets for andalusite.

## Separation

**089381 SEPARATION OF SECONDARY REFRACTORIES BY TYPE BY RADIORESONANCE AND X-RAY RADIOMETRIC METHODS.** An analysis of the results obtained shows that in both cases the periclase-chromite variety differs significantly (by four or five times) in the analytical parameter, which is related to the Ti and Cr content, from the other types and therefore in x-ray radiometric separation may be separated from aluminosilicate and periclase refractory scrap. Aluminosilicate and periclase secondary refractories of a different degree of change differ weakly in the analytical parameters for Cr, Fe, and other combinations of elements other than Ti. For the latter the difference is about three times, which is insufficient for reliable separation since with the use of algorithms in the spectrometric variation on the prototype separator the energy area of recording of the characteristic x-ray radiation of titanium must be increased. This will lead to leveling of the difference between the analytical parameters of aluminosilicate and periclase secondary refractories for titanium and as the result to the impossibility of sorting. Therefore x-ray radiometric separation is of practical interest only as a method of separation of the periclase chromite variety of refractories. 4 refs.

## Silica Brick

**089382 SPECTRAL REFLECTING CHARACTERISTICS OF DINAS REFRACTORY.** In this work an investigation was made of vitreous dinas produced by the Pervouralsk Dinas Plant. The chemical composition of the dinas (wt.%) was 93.0  $\text{SiO}_2$ , 3.5 CaO, and 3.5  $\text{Al}_2\text{O}_3$  and the open porosity 22%. Refractories in the as-received condition and also after 6 months of service in a glass melting furnace were investigated. Experiments were made on determination of the angular distribution of the intensity of the reflected radiation. 4 refs.

**089383 STATISTICAL DATA ON THERMAL EXPANSION IN DINAS REFRACTORIES FOR COKING OVENS.** Statistical data have been obtained on the temperature dependence of the thermal expansion for dinas refractories for coking ovens in the range from 20 to 1400°C. The temperature coefficient of linear expansion does not vary monotonically as the temperature rises and has peaks near the temperatures of the phase transformations in tridymite, cristobalite, and quartz. The thermal expansion curves for dinas brick show hysteresis due to the phase transitions in silica. 3 refs.

**089384 EFFECT OF PYROPHYLLITE ON THE PROPERTIES OF DINAS.** This article contains the results of research into the effects of pyrophyllite on the properties of dinas refractories and is aimed at studying the possibility of extending the reserves of quartzite raw materials for their production. Pyrophyllite  $3\text{Al}_2\text{O}_3\cdot 4\text{SiO}_2\cdot 2\text{H}_2\text{O}$  belongs to the micaceous group of materials. Its chemical composition,  $\text{Al}_2\text{O}_3$  28.3,  $\text{SiO}_2$  66.7,  $\text{H}_2\text{O}$  5.0. Impurities are encountered as  $\text{MgO}$  (up to 5%),  $\text{Fe}_2\text{O}_3$ , CaO, alkalis, and titania. Specimens of dinas with additions of only pyrophyllitic slates have a compressive strength of 9-12.2 N/mm<sup>2</sup> and open porosity of 23-23.5% with additions of quartz-pyrophyllitic slate 11.6-13.5 N/mm<sup>2</sup> and 23.1-23.5%. The conversion of the quartzite is moderate - the density of the dinas is 2.38-2.41 g/cm<sup>3</sup>. 9 refs.

**Silicon Nitride** See CERAMIC MATERIALS—Silicon Nitride.

**Sintering** See Also CERAMIC MATERIALS—Porosity; MAGNESIUM COMPOUNDS—Additives; POWDER METALLURGY—Sintering.

**089385 EFFECT OF ATMOSPHERE ON THE SINTERING PROCESS OF THE MIXTURES OF CAUSTIC MAGNESITE AND CHROMIUM ORE.** In the high temperature state, the mixtures of the experimental composition are represented by a solid solution of chromium spinellid in periclase (in CO atmosphere as well as in air). Air cooling of the frits is accompanied by the isolation (precipitation) of a secondary spinellid and the transformation  $\text{FeO} \rightarrow \text{Fe}_2\text{O}_3$ , which does not virtually occur in CO atmosphere. When heated in CO atmosphere,

the sinterability of the experimental mixtures is inferior to that observed when heated in air; in this case, some depletion of magnesium and chromium oxides occurs due to their sublimation. 8 refs.

**089386 INVESTIGATING THE MAGNESIUM OXIDE SINTERING PROCESS.** The casual relationship between the densification of magnesium-oxide compacts and the elimination of pores during isothermal sintering at various temperatures on the one hand and the shaping pressure applied in the preparation of compacts and the duration of isothermal sintering on the other, were investigated. The densities of the various sintered specimens were determined, and micrographs were obtained. The process of densification undergone by magnesium oxide specimens during sintering was approximated by a polynomial expression. In German and English. 8 refs.

Petric, N. (Technoloski Fakultat, Split, Yugosl); Petric, B.; Mirosevic-Anzulovic, M.; Bogdanic, N. *CFI Ceram Forum Int Ber DKG* v 65 n 1-2 Jan-Feb 1988 p 7-10.

**089387 SINTERING OF  $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$  COMPOUNDS.** Heating of  $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$  compacts above about 930°C is shown to induce liquid formation. Presence of the liquid phase results in excellent densification, but limited superconducting properties. Sintering below 930°C occurs primarily by solid-state diffusion. Although the density of these samples is low, the superconducting properties are similar to those of the dense materials produced via liquid-phase sintering. The highest current densities ( $\approx 500 \text{ A/cm}^2$ ) have been obtained in these solid-state sintered samples. (Author abstract) 11 refs.

## Solidification

**089388 DIRECTIONALLY SOLIDIFIED STRUCTURE OF  $\text{MgO-ZrO}_2\text{-X(X: Ca, Y, Al, Si)}$  EUTECTICS.** Directionally solidified structure of  $\text{MgO-ZrO}_2$  eutectic with small amounts of additives ( $\text{CaO}$ ,  $\text{Y}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$ ) has been investigated. The oriented microstructure with lamellar and fibrous morphologies has been obtained in the case of  $\text{CaO}$  and  $\text{Y}_2\text{O}_3$  additions, in which the additives can be dissolved in the  $\text{ZrO}_2$  matrix. On the other hand, the cell boundaries have been developed with a small amount of  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$ . In the case of  $\text{SiO}_2$  addition, the precipitation of  $\text{Mg}_2\text{SiO}_4$  has been observed at the  $\text{MgO/ZrO}_2$  interface. It nucleates coherently at the  $\text{MgO}$  side of the interface in the early stage of precipitation. This results from the small solubility of the additives in  $\text{MgO}$ . (Author abstract). 19 Refs. In Japanese.

## Spectroscopic Analysis

**089389 APPLICATION OF THE METHOD OF ATOMIC ABSORPTION FOR ANALYZING NON-FERROUS METALS IN REFRACTORIES AFTER SERVICE IN THE FURNACES OF NONFERROUS METALLURGY.** Copper, cobalt, and nickel are present in insignificant amounts (0.01-0.1%) in the raw materials used for producing refractories. In view of this, nonferrous metals appear in refractories mainly due to the interaction of the melt with the lining. As compared to chemical methods, the developed methods of atomic absorption analysis of nonferrous metals are selective, rapid, less laborious, and avoid the necessity of using platinum crucibles. 5 refs.

Ushakova, T.G. (Vostochnyi Inst of Refractories, USSR); Lapteva, T.N. *Refractories* v 28 n 9-10 Sep-Oct 1987 p 504-507.

**Stability** See TUNGSTEN AND ALLOYS—Stability.

**Stresses** See Also BASIC OXYGEN CONVERTERS—Refractory Materials.

**089390 INTERNAL STRESSES OF REFRACTORY BODIES AND THE METHODS OF THEIR CONTROL.** Internal stresses develop during drying and heating of concrete lined thermal units of the selected regime of increasing the temperature is incorrect. These stresses can lead to sudden brittle fracture of the refractories, disarrangement of their structure, chipped surfaces, cracks, etc. Nondestructive control methods (NCM) and analytical methods are used to obtain information on the characteristics of the material and on the changes occurring due to the internal stresses. We conducted studies on the heat resistant concretes using a 2.5 MHz integrated direct emitter of a UDM-IM defectoscope as a finder head. During the process of ultrasonic sounding, the error did not exceed 0.15%. The nondestructive methods of studying the internal stresses and the theoretical concepts of reliability make it possible to evaluate the quality of the structures. 3 refs.

## Synthesis

**089391 EFFECT OF PRESSURE ON THE ATOMIC STRUCTURE OF ULTRADISPERSED TITANIUM NITRIDE.** It is established that at pressures up to 7.7 GPa the structure type, lattice period and composition of ultradispersed titanium nitride do not undergo significant changes during pressing. Noting a slight increase in the rms displacements of the atoms, quantitative data are obtained by harmonic analysis of the shapes of the neutron-diffraction lines concerning an increase in the microdistortions of the lattice and a decrease in the size of the coherent scattering regions in pressed TiN powders during an increase in the pressing pressure. In Russian. 7 refs.

**089392 SYNTHESIS OF CORDIERITE FROM NATURAL MATERIALS IN THE PRESENCE OF  $\text{Al}_2\text{O}_3$ -CONTAINING COMPONENTS.** The authors examined some reactions in the synthesis of cordierite from natural materials and alumina. The volume changes occurring during these reactions, the yield of cordierite, and the value of the Gibbs free energy have been calculated. The most favorable method under industrial conditions is to synthesize cordierite from a mixture of talc, kaolin and alumina. The phase composition of the cordierite sinters based on these materials has been studied. The synthesis can be done in the presence of  $\text{Al}_2\text{O}_3$ -containing components on condition that the firing temperature does not exceed 1659°K when the sintering is effected in parallel. 8 refs.

Zobina, L.D. (V.I. Lenin Kharkov Polytechnic Inst, USSR); Semchenko, G.D.; Tarnopol'skaya, R.A.; Belik, Ya.G.; Kharitonov, F.Ya.; Rudnitskaya, V.P. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 82-84.

**089393 SYNTHESIS OF  $\text{WO}_3$  WHISKER CRYSTALS BY PYROHYDROLYSIS OF  $\text{WF}_6$ .** Filamentary  $\text{WO}_3$  single crystals up to 50 mm in length have been obtained from the reaction between water vapor and  $\text{WF}_6$  emanating from a Teflon-like material saturated with this compound. A study was made of the effect of the synthesis conditions on the growth rate and yield of the single crystals. A probable model of the process is proposed which allows for plugging of the pores in the bulk of the Teflon-like material, cyclical expulsion of the plugs formed, and their accretion. 9 refs. In Russian.

Rakov, E.G.; Teslenko, V.V. *Izv Akad Nauk SSSR Neorg Mater* v 23 n 5 May 1987 p 802-806.

**089394 PHASE COMPOSITION OF THE PRODUCTS FORMING DURING AN ELECTRIC EXPLOSION OF MIXTURES OF NIOBIUM AND CARBON.** It is established that during an electric explosion of mixtures of niobium powder (containing 0.12 wt.% H) and graphite powder in water, multiphase products including  $\text{NbC}_x\text{O}_y$ ,  $\text{Nb}_2\text{C}_x\text{O}_y$ ,  $\text{NbO}$ ,  $\text{NbO}_2$ ,  $\text{Nb}_2\text{O}_5$ , Nb and C are formed. With an increase in the carbon concentration in the mixture the total quantity of oxycarbide phases in the product increases, while that of the oxide phases decreases. Moreover, the lattice periods of the oxycarbides obtained increase, which indicates an increase in their carbon concentration. 13 refs. In Russian.

**089395 SYNTHESIS OF HIGH TEMPERATURE MATERIALS BY SELF-PROPAGATING COMBUSTION METHODS.** Highly exothermic reactions can become self-sustaining and will propagate through the reactant mixture in the form of a combustion wave. As the combustion wave advances, the reactants are converted to the product(s). The use of such reactions to prepare materials has been commonly referred to as the self-propagating high temperature synthesis (SHS) method. Combustion synthesis is claimed to produce materials with superior properties relative to those prepared by conventional methods. 90 refs.

Munir, Zuhair A. (Univ of California, Davis, CA, USA). *Am Ceram Soc Bull* v 67 n 2 Feb 1988 p 342-349.

**089396 SOLID-STATE COMBUSTION SYNTHESIS OF CERAMICS AND ALLOYS IN REDUCED GRAVITY.** Possible microgravity effects are explored in the combustion synthesis of ceramics and alloys from their constituent elements. Molten intermediates are typically present during the combustion process, thereby offering the chance for natural convection to take place. Numerical simulations suggest that the combustion front in concert with gravity may act as a partial zone-refinement mechanism which is attempting to sweep out porosity in the sample. Contrary to suggestions by dimensional analysis, no effects on the combustion rate are seen. An analytical model of the combustion velocity as a function of the gravitational field and the spreading rate of molten material gives the correct order of magnitude of the gravity effect as measured by centrifuge experiments. (Author abstract). 41 Refs.

**089398 EVALUATING THE BEHAVIOR OF SOME TYPES OF CERAMICS DURING TESTING IN A STREAM OF HIGH-TEMPERATURE GAS.** The article presents the results of determining the resistance to frequent heatings of materials having a dense structure and which are based on high-alumina ceramics. We established the capacity of a range of ceramics to withstand high rates of thermal stress (frequent heating). Thus, the spalling-resistant quartz ceramics and aluminum titanate can withstand repeated frequent heating to temperatures above 1400°C, practically close to their fusing temperatures. Nonspalling-resistant materials based on corundum and mullite chamotte withstand frequent heating to much lower temperatures (up to 1200°C). Incorporating into the corundum of zircon and aluminum titanate increases the resistance to frequent heating at higher temperatures (1500°C and above). The increase in the content of  $Al_2O_3$  in the mullite chamotte increases its capacity for frequent heating. 12 refs.

### Thermal Conductivity

**089399 DIE EIGENSCHAFTEN GESCHAEUMTER FEUERLEICHTSTEINE: MESSUNG UND BERECHNUNG DER WAERMELEITFAEHIGKEIT.** [Properties of Lightweight Foamed Refractories: Measurement and Computation of Thermal Conductivity]. A number of theories are known for the computation of thermal conductivity. Starting from samples of quartz-containing materials, silica and corundum with varying porosity, measurements were carried out which were then compared to computations based on various theoretical models. The theory developed by Ondracek proved to be the only applicable one in case of lightweight foamed refractories. The paper discusses this fact, taking into account the influence of radiation. In German. 14 refs.

### Thermal Expansion

**089403 CONSIDERATIONS ON SOME THERMAL APPLICATIONS FOR CORDIERITE AND CORDIERITE-MULLITE MATERIALS.** The extrusion of cordierite ceramic monolithic supports for automobile exhaust catalysis involves extreme shaping conditions that lead to heavily directional microstructural properties. Observations made on extruded cordierite-mullite kiln furniture during fast firing indicate the transferability of microstructural characteristics. What proves to be of advantage in the first case must be viewed as a cause of premature failure in the second. An explanation is offered for the occurrence of anisotropic expansion behavior and its subsidence as a result of thermal after treatment. In German and English. 11 refs.

**089406 SECONDARY EXPANSION OF MULLITE REFRACTORIES CONTAINING CALCINED BAUXITE AND CALCINED CLAY.** The kinetics of the secondary expansion of a 72 percent-alumina aluminosilicate refractory, containing either calcined bauxite and calcined clay or tabular alumina and calcined clay, were studied as a function of time, temperature, and particle size. Rapid heating of specimens to isothermal reheating temperatures, followed by rapid cooling, was used to minimize heating and cooling effects. Mullitization, accompanied by volume expansion, occurred during the isothermal reheating of the specimens containing calcined bauxite. (Edited author abstract). 8 Refs.

Huang, Bai Y. (Iowa State Univ, Ames, IA, USA); Mcgee, Thomas D. *Am Ceram Soc Bull* v 67 n 7 Jul 1988 p 1235-1238.

**Thermal Properties.** See Also CERAMIC MATERIALS—Applications; FURNACES, METALLURGICAL—Heat Transfer; LADLES—Lining.

**089407 CRACK RESISTANCE OF CORUNDUM REFRACTORIES OVER A WIDE RANGE OF TEM-**

**PERATURES.** In this paper, authors studied the effect of temperature on the parameter  $K_{IC}$  and the value of  $K_I$  of a group of corundum refractories having different structures. The ultimate bend strength  $\sigma_{bnd}$  and the critical stress intensity factor  $K_{IC}$  of a group of corundum refractories were determined over a wide range of temperatures. It was shown that the temperature dependences of  $\sigma_{bnd}$  and  $K_{IC}$  have a similar nature. In the refractories having the usual porous structure, the rate of decrease of  $K_{IC}$  with increasing temperature is less than that of  $\sigma_{bnd}$ . Owing to this, the coefficient of crack resistance  $K_I$  of the refractories increases at high temperatures. The refractories having a porous-fissured structure, exhibit an almost identical reduction of  $\sigma_{bnd}$  and  $K_{IC}$  with increasing temperature and the magnitude of  $K_I$  increases very insignificantly. 5 refs.

**089408 SUSPENDED REFRACTORY STRUCTURES.** This paper reviews briefly some aspects of refractories engineering, with special reference to suspended refractory structures of both brick and monolithic materials. The very latest developments, however, in suspended refractory materials incorporate the advantages of low thermal mass (LTM) and monolithic format. As in the case of dense refractories there are indications that the monolithic format is growing extremely fast. This is because of the relatively easier, cheaper installation combined with better mechanical properties and longer life. Some very advanced engineering has produced some extremely effective materials and systems. The two main product ranges are those of ultralight weights - gun mixes and moldables.

## Wear Resisting

**089412 TESTS OF REFRACTORIES IN ARGON-OXYGEN REFINING OF METAL.** For the purpose of selection of the most wear resistant refractories suitable for service in the cylindrical portion of an argon-arc refining unit the authors conducted comparative tests of parts of different types in the lining of a 10-ton steel melting unit. As the result of comparative tests it was established that the most resistant of the tested materials is the periclase-spinel refractory with the addition of chrome-alumina-spinel. These parts are recommended for lining the cylindrical portion of a pilot argon-oxygen refining unit. 10 refs.

**Wetting See Also ELECTRODES—Materials.**

**089413 WETTABILITY OF SOLID OXIDES BY LIQUID IRON ALLOYS UNDER REDUCED PRESSURE.** Different values of surface tension and contact angle were obtained by different furnaces whose heating elements were molybdenum and graphite, respectively. This can be explained by a difference in partial pressure of oxygen in the furnaces. The values of surface tension obtained by the furnace whose heating element was graphite were higher than previous work. This is caused by an extremely low oxygen pressure in this work compared with those in previous work. The difference in the wetting of  $Al_2O_3$  and  $MgO$  with liquid iron alloys can be attributed to the difference in solubilities of Al and Mg in liquid iron. (Edited author abstract) In Japanese. 22 refs.

**089414 ANTI-PHASE BOUNDARIES IN TETRAGONAL ZIRCONIA.** Using specimens prepared by arc melting and sintering, antiphase boundaries (APB's) in yttria partially stabilized zirconia were observed by transmission electron microscopy. APB's are introduced

in the tetragonal phase during cubic-tetragonal displacive transformation on cooling. Inter-APB distance decreases with  $Y_2O_3$  content, but in the range of 5 to 7 mol%  $Y_2O_3$ , it is kept at a constant value of about 0.05  $\mu m$ . In an 8 mol%  $Y_2O_3$  specimen, APB's cannot be observed. When a quenched tetragonal specimen is annealed, APB density decreases and APB's become flattened lying on {111} planes. (Edited author abstract) In Japanese. 9 refs.

**089415 MEASUREMENT OF FRACTURE TOUGHNESS AND EFFECT OF LOADING RATE ON ITS VALUE IN PSZ AND  $Si_3N_4$  CERAMICS.** The dynamic fracture toughness was measured by the impact response curve method using a strain gage attached to the specimen in the instrumented Charpy impact test. The static fracture toughness test using precracked specimens can evaluate the lower limits of static fracture toughness in contrast with conventional methods. Dynamic fracture toughness in partially stabilized zirconia has been observed to increase monotonously with loading rate K, while that in  $Si_3N_4$  decreases at first and then increases with increase of K. (Edited author abstract) In Japanese. 28 refs.

**089416 PARTIALLY STABILIZED ZIRCONIA COMPACTS OBTAINED BY CENTRIFUGAL CONSOLIDATION.**  $ZrO_2$  powders containing 2 and 2.5 mol%  $Y_2O_3$  were dispersed in nitric acid aqueous solution at pH 3 with the aid of high power (1 kw) ultrasonic agitation. Centrifugal force was applied for sedimentation and compaction. Three-point bending tests were carried out. The highest strength was 1.9 GPa in the case of a specimen containing 2 mol%  $Y_2O_3$ . Coarse agglomerates were condensed at the bottom of the consolidated body and no segregation of  $Y_2O_3$  took place along the centrifugal direction. Application of a high centrifugal force was effective for further compaction. (Edited author abstract) In Japanese. 22 refs.

**089417 EFFECT OF SINTERING TIME ON THE STABILITY OF  $Y_2O_3$  PARTIALLY STABILIZED ZIRCONIA.** In the present investigation on the mechanical properties of 2 and 3 mol%  $Y_2O_3$ -bearing partially stabilized  $ZrO_2$  (Y-PSZ) prepared with coprecipitation powders, it was found that the maximum toughness was obtained by sintering for several hundred ks at 1573 K. In order to understand this, a structural analysis was performed by TEM-EDS and XRD. In the specimen sintered at 1573 K for 3.6 ks, each grain consisted of an almost average composition of the specimen. After prolonged sintering, the grain size was kept under 1  $\mu m$ , but the composition of each grain began to change continuously toward the equilibrium values of the tetragonal or cubic phase alternatively. This type of phase separation in ultrafine polycrystals is considered spinodal decomposition without a modulated structure. With the decrease of  $Y_2O_3$  content in the tetragonal phase, the stability of Y-PSZ decreased and toughness changed. (Edited author abstract) In Japanese. 10 refs.

**089418 HIGH-TEMPERATURE DEFORMATION OF A FINE-GRAINED ZIRCONIA.** Deformation tests have been undertaken, up to large strains, on fine-grained zirconia polycrystals and we report the first results in this letter. They concern tests, performed up to strains near 50%, during which the microstructure evolution has been observed, by transmission electron microscopy (TEM), in a parallel direction with the mechanical behavior of the

material. The material was a commercial sintered zirconia partially stabilized with yttria (about 3 mol%). The main result of TEM observations concerns the microstructure evolution which is generally weak, even after a strain of nearly 50% at 1300°C. 23 refs.

**089419 YTTRIA-ZIRCONIA: EFFECT OF MICROSTRUCTURE ON CONDUCTIVITY.** Complex impedance measurements and detailed analysis of the grain-boundary microstructure have been made on fully stabilized yttria-zirconia sintered bodies as a function of grain size. The prereacted yttria-zirconia powder used in this study was obtained from a commercial source. The powder has very high reactivity and starts sintering around 1200°C. The densification process is complete around 1350°C but the grain growth continues almost linearly with sintering temperature. The grain size variation obtained was between 1 and 30  $\mu m$ . The grain-boundary resistivity when plotted against grain size showed an inflection in the vicinity of 1500°C sintering temperature. These results have been explained in terms of the grain-boundary microstructure changing with the sintering temperature. The thickness of the grain-boundary layer determined from impedance data and transmission electron micrographs are in reasonably good agreement. The activation energy for the grain-boundary resistivity was only slightly higher than that for the lattice resistivity. (Author abstract) 14 refs.

**089420 INFLUENCE OF CRYSTAL LATTICE DEFECTIVENESS ON THE PROPERTIES OF SOLID SOLUTIONS BASED ON  $ZrO_2$ .** It is shown that the parameter of the crystal lattice of cubic solid solutions based on zirconium dioxide stabilized with oxides of yttrium, ytterbium, and calcium is increased with a rise in their concentrations, and hardly alters for the solid solution  $ZrO_2$ - $Sc_2O_3$ . In the solid solutions of  $Y_2O_3$ ,  $Sc_2O_3$ , and CaO in zirconium dioxide there is a reduction in the x-ray densities with an increase in the concentration of stabilizing additives. For the solid solutions  $ZrO_2$ - $Yb_2O_3$  there is an increase in the x-ray density with rise in the concentration of ytterbium oxide. The introduction of 9-13% stabilizing oxides ensures the highest density for the ceramics. 9 refs.

Chusovitina, T.V. (East Inst of Refractories, USSR); Ust'yantsev, V.M.; Tretnikova, M.G.; Toropov, Yu.S. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 13-16.

**089421 INCREASING THE STRENGTH OF CERAMICS MADE OF ZIRCONIUM DIOXIDE DUE TO EUTECTOID DECOMPOSITION OF SOLID SOLUTIONS IN THE SYSTEM  $ZrO_2$ - $MgO$ .** Ceramics made from partly stabilized zirconium dioxide are being increasingly used in science and technology owing to their high strength and impact strength. Among the most promising materials of this type are solid solutions of magnesia in zirconia which also possess excellent thermal shock resistance. The aim of the present work was to study the influence of the amount of  $MgO$  and the firing schedule on the strength of the ceramics. Specimens of  $ZrO_2$  containing  $MgO$  2.8, 3.0, and 3.2% were evaluated. The material possessing the optimum properties was used to make fibers which were tested for drawing copper wire. 6 refs.

Geichev, V.G. (VNIInergotsvetmet, USSR); Pliner, S.Yu. *Refractories* v 28 n 1-2 Jan-Feb 1987 p 88-90.

**089422 AUTOCATALYSIS AND MICROSTRUCTURAL FEATURES IN AGEING OF A 3mol% Y-TZP.** Aging kinetics of a 3mol% Y-TZP at temperatures of 120-400°C in air and in approximately 0.1 MPa water-vapor atmosphere exhibit different features. In air, it is typified by the sigmoidal form; while in water, a character-

istic exponential is observed. A new phase of  $d=0.3027-0.2979$  nm was produced on aging under the same conditions both in air and in water atmosphere. Based on a set of superlattice streaking spots observed by selected-area diffraction pattern (SADP), it is suggested that the excess of  $Y^{+3}$  solute, or oxygen vacancies,  $Vo$ , may have given rise to these extra diffraction spots. (Author abstract) 19 refs.

**089423 EFFECT OF  $Y_2O_3$  AND  $Nd_2O_3$  ADDITIVES ON THE STRUCTURE AND STABILITY OF  $ZrO_2$ -BASED PHASES IN ALLOYS OF THE  $Al_2O_3$ - $ZrO_2$  SYSTEM.** Additions of 12 wt.%  $Y_2O_3$  or 30 wt.% yttrium concentrate (with respect to  $ZrO_2$ ) to a charge of composition 75 wt.%  $Al_2O_3$  + 25 wt.%  $ZrO_2$  make it possible to obtain stabilized  $ZrO_2$  in samples synthesized by alloying. Upon the introduction of 30 wt.%  $Nd_2O_3$  a 60% stabilized  $ZrO_2$  is formed. The stabilized phase has the  $\beta$ - $ZrO_2$  structure in the case of additives no greater than 12 wt.%  $Y_2O_3$  and a structure characteristic of  $\gamma$ - $ZrO_2$  (F) in the case of a 15 wt.%  $Y_2O_3$  content. In the case of 10-30 wt.%  $Nd_2O_3$  or 15-30 wt.% yttrium concentrate the stabilized  $ZrO_2$  constitutes a mixture of a disordered solid solution with a structure close to  $\gamma$ - $ZrO_2$  (F) and an ordered solid solution with the pyrochlore structure,  $\gamma$ - $ZrO_2$  (II). 6 refs. In Russian.

**089424 DIP COATING OF ZIRCONIA AND MIXED ZIRCONIA FILMS.** When glycols (except ethyleneglycol) were added to an isopropanol solution of zirconium n-butoxide, the corresponding glycolates were formed by the alcohol exchange reaction, and the precipitation of oxide by hydrolysis was strongly suppressed. Diethylene glycol was most effective as the glycol additive for the precipitation retarder. The film thickness can be controlled by the alkoxide concentration, water/alkoxide ratio, and the pulling-up rate of the substrate plate. The maximum thickness of uniform transparent zirconia films obtained in one dipping-drying-heating cycle was about 1500 Å. Much thicker films can be obtained by repeating the cycle. **089425 INFLUENCE OF  $Y_2O_3$  ADDITION ON THE TRANSFORMATION BEHAVIOR OF  $ZrO_2$  IN  $Al_2O_3$ - $ZrO_2$  COMPOSITES.** The effect of  $Y_2O_3$  content on the stress-induced transformation of  $ZrO_2$  in sintered  $Al_2O_3$ - $ZrO_2$  composites was studied by using laser Raman spectroscopy and X-ray diffraction method, and their mechanical properties, such as Young's modulus, bending strength, Vickers hardness and fracture toughness, were measured. The Raman measurement of  $ZrO_2$  phases on the fracture and tensile surfaces after bending test indicated that the stress-induced transformation proceeded more extensively in the composites with low  $Y_2O_3$  contents and near the fracture surfaces. Consequently, fracture toughness increased with decreasing  $Y_2O_3$  content, and this tendency was related to the stress-induced transformation and the presence of microcracking. (Edited author abstract) In Japanese. 19 refs.

**089426 SIZE CONTROL OF  $ZrO_2$  AGGREGATED PARTICLES BY CHLORIDE-COEEXISTED HYDROLYSIS AND SINTERING THEM.** The effect of metal chlorides added to  $ZrOCl_2$  solutions on the crystallization of monoclinic  $ZrO_2$  in high temperature hydrolysis was studied. It was found that an increase in the amount of chloride ions decreases the crystallinity and forming rate of  $ZrO_2$  and increase the size of  $ZrO_2$  aggregated particles.

The  $ZrO_4$  aggregated particles were grown to about 0.4  $\mu$ m by hydrolysis at 150°C. Compacts of ultrafine powder obtained by hydrolysis densified at lower temperatures, along with larger shrinkage due to lower compactability. (Edited author abstract) In Japanese. 17 refs.

**089427 FROTTEMENT LUBRIFIE DE LA ZIRCONIE.** [Lubricated Friction of Zirconia]. The use of zirconia as the jacket material of recently designed diesel engines poses the problem of choosing the segment material and a suitable lubricant. Tests of various combinations of materials and lubricants make it possible to ascertain the wear behavior of the ceramic and the temperature resistance of the lubricants. It is shown that the nature of the counter-abrading material has very little effect on the friction coefficient and wear rate. Tests at increasing temperature showed that silicone-based lubricants have a maximum utilization temperature which is higher than that of ester-based lubricants. It is noted that wear phenomena in zirconia are related to the nature of the lubricant - namely, plastic deformation streaks without noticeable material loss in the case of the ester-based lubricant; and material loss in the form of excessive corrosive wear associated with plastic deformation in the case of the silicone-based lubricant. In French. 7 refs.

**089429 MICROSTRUCTURE OF ZIRCONIA FILMS DEPOSITED WITH ION ASSISTANCE.** Zirconia films were deposited in vacuum from an electron-beam hearth with simultaneous ion bombardment from a Kaufman source. The effects of argon, oxygen and nitrogen ions were investigated, together with those of temperature and substrate type. For amorphous substrates, without ions, X-ray and electron diffraction showed that amorphous films were produced at room temperature. Deposition on to 300°C amorphous substrates produced the monoclinic form. Ion assistance converted the structure to cubic. It was found that deposition on to KCl (100) substrates also produced the cubic form at elevated temperatures, with or without ions. High-resolution microscopy showed that these films were crystallography oriented with either  $\langle 100 \rangle$  or  $\langle 110 \rangle$  normal to the KCl substrate. (Edited author abstract) 11 refs.

**089431 WEAR OF PARTIALLY STABILIZED ZIRCONIA: SLIDING VS. ROLLING CONTACT.** Transformation toughened partially stabilized zirconia (PSZ) was observed to have a much lower weight loss in sliding wear tests compared to rolling wear tests. In the sliding contact, the stress state in the stationary member is constant except for asperity variation in the moving member. In rolling contact, the stress state in the roller varies as it goes through contact much as the stress varies in fatigue loading. In brittle ceramics, rolling wear testing is a method of investigating fatigue properties which cannot be determined by conventional methods. Two ceramics were tested, PSZ (3 w/o MgO) and for comparison,  $Si_3N_4$ . 5 refs.

**089432 THERMAL SHOCK RESISTANCE OF YTTRIA-DOPED TETRAGONAL ZIRCONIA POLYCRYSTALS: EFFECT OF SOLVENT IN QUENCHING TEST.** Because of superior mechanical properties, such as high fracture strength and high fracture toughness, yttria-doped tetragonal zirconia polycrystals (Y-TZP) have received special attention in the field of structural application. In the present study, thermal shock resistance of Y-TZP was determined by using various solvents as quenching media and the experimental data were examined by heat-conduction mechanisms. The results indicate that the cracks in Y-TZP were propagated because the thermal stress was significantly smaller than the bending fracture stress. It is suspected that the tetragonal-to-monoclinic phase transformation at the crack tips plays a significant role in the propagation of the cracks in the presence of water and some organic solvents. 19 refs.

**089434 EFFECT OF LIGHT ASH OF SOLID FUELS ON ZIRCONIA REFRACTORIES.** The application of coals worsens the service conditions of the refractory lining in thermal units because of the corrosion of refractories by light (fly) ash. We studied the resistance of zirconia refractories to the action of the mixtures of light ash of two types of coals and an alkali additive (potash  $K_2CO_3$ ). The refractories were produced using commercial purity zirconium dioxide and had an open porosity of 14-22%, an apparent density of 4.6-4.75 g/cm<sup>3</sup>, and an ultimate compressive strength of 150-200 N/mm<sup>2</sup>. The action of the melts of the light ash containing potash additive on zirconia refractories leads to their destruction due to destabilization of the cubic solid solution of CaO in  $ZrO_2$  accompanied by the formation of  $\alpha$ - $ZrO_2$ , melilites, and a glass phase and the formation of spinellids, pyroxenes, and fayalite if iron-bearing compounds are present in the ash. 8 refs.

**089436 ELECTRICAL CONDUCTION IN YTTERBIUM-DOPED ZIRCONIA AT ELEVATED TEMPERATURES.** Electrical conductivity measurements in  $\text{Yb}_2\text{O}_3$ -stabilized zirconia were carried out using an ac four-point probe method on cylindrical samples of an even diameter of 5 mm. The samples were prepared from an intimate mixture of  $\text{ZrO}_2$  and  $\text{Yb}_2\text{O}_3$  and presintered at 800°C for 20 h. The final sintering processes were carried out after machining the samples at 1750°C for 24 h or at 1900°C for 16 h. The density of the samples was more than 95% theoretical. Electrical conductivity measurements on zirconia doped with different amounts of  $\text{Yb}_2\text{O}_3$  showed that the conductivity decreases with increase in the dopant concentration. The phenomenon was explained by the formation of certain types of associates in the crystal structure. 4 refs.

Moztarzadeh, F. (Materials & Energy Research Cent, Tehran, Iran). *J Mater Sci Lett* v 6 n 12 Dec 1987 p 1385-1386.

**089437 SYNTHESIS AND CHARACTERIZATION OF FULLY/PARTIALLY STABILIZED ZIRCONIA POWDERS.** The present report describes the synthesis of reactive powders, powder morphology and evaluation of powders by thermal analysis technique. The progress in sintering and densification of compacts was followed from apparent density measurement. The phases present were identified by X-ray powder diffraction and the microstructure of sintered bodies using scanning electron microscopy (SEM). It is concluded that: (a) The finer the particle size the larger is the specific surface area; (b) increased calcia addition resulted in decreasing densification; (c) 20 mol% additive shows an absence of monoclinic phase. 9 refs.

Mondal, B. (Indian Inst of Technology, Karagpur, India); Virkar, A.N.; Chattopadhyay, A.B.; Paul, A. *J Mater Sci Lett* v 6 n 12 Dec 1987 p 1395-1398.

**089438 EFFECT OF DOPANT CONCENTRATION ON THE GRAIN BOUNDARY AND VOLUME RESISTIVITY OF YTTRIA-ZIRCONIA.** In this letter the results of impedance measurements on several yttria-zirconia compositions are described. Impedance measurements were made over the temperature range 375 to 600°C and a frequency range of 1 Hz to 1 MHz. The major phases present were either tetragonal or a mixture of tetragonal and cubic. At low temperatures the volume conductivity of the tetragonal phase appears to be comparable with or better than that of the cubic phase. This may be a consequence of the inherently low dopant concentration in the tetragonal phase (less interaction among defects). 9 refs.

Badwal, S.P.S. (CSIRO, Clayton, Aust). *J Mater Sci Lett* v 6 n 12 Dec 1987 p 1419-1421.

**089439 WETTABILITY BETWEEN ZIRCONIA CERAMICS AND THE LIQUID METALS COPPER, NICKEL AND COBALT.** Polished discs of polycrystalline zirconia stabilized with 5 wt% CaO and with a purity of 99% were used as substrate in the wetting experiments. The measured wetting angles, together with literature data of the surface energies of liquid metals were used for the calculation of the work of adhesion,  $W_a$ . Linear extrapolation of  $W_a$  to the metal's melting point indicates that nickel has a higher value of work of adhesion as compared with the metals copper and cobalt. This result shows that non-wetting systems can form a strong interface which influences positively the mechanical properties of sintered metal-ceramic composite material. 8 refs.

**089440 EFFECT OF ALUMINA ADDITIONS ON THE GRAIN BOUNDARY AND VOLUME RESISTIVITY OF TETRAGONAL ZIRCONIA POLYCRYSTALS.** There has been much interest in a new class of strong engineering ceramics based on fine-grained yttria partially stabilized zirconias (Y-TZP). This study reports the effect of  $\text{Al}_2\text{O}_3$  content on the microstructure, grain boundary and volume resistivity of these materials. The Arrhenius plots for the total resistivity of RZY2. 5-10 $\text{Al}_2\text{O}_3$ , magnesia partially stabilized zirconia and yttria (10 mol%) stabilized zirconia show that the former material has the highest conductivity below about 450°C. Y-TZP ceramics containing alumina are candidates for applications requiring a combination of high strength and good oxygen ion mobility. 12 refs.

Rajendran, S. (CSIRO, Clayton, Aust); Drennan, J.; Badwal, S.P.S. *J Mater Sci Lett* v 6 n 12 Dec 1987 p 1431-1434.

**089441 HIPING OF  $\text{ZrO}_2$ -TRANSFORMATION-TOUGHENED GLASS-CERAMICS PREPARED BY THE SOL-GEL PROCESS FROM METAL ALKOXIDES.**  $\text{ZrO}_2$ -containing ceramics have recently become of interest because of their high strength and fracture toughness, which are attributed to the stress-induced transformation of tetragonal (t-)  $\text{ZrO}_2$ . Using the metal alkoxide sol-gel process, we have prepared the monolithic glass-ceramics in the system  $\text{ZrO}_2$ - $\text{SiO}_2$  containing up to 60 mol% (75 wt%)  $\text{ZrO}_2$ . In the present work, to obtain the high-strength glass-ceramics, the powders were hot-isostatically pressed (hiped). High-strength glass-ceramics were obtained by hiping the t- $\text{ZrO}_2$  precipitated glass-ceramics. The hiping was more effective in consolidating the glass-ceramics containing large pores. 10 refs.

**089442 METASTABLE TETRAGONAL ZIRCONIA IN THE  $\text{ZrO}_2$ - $\text{YF}_3$ - $\text{YO}_{1.5}$  SYSTEM.** In the pseudo binary systems  $\text{ZrO}_2$ -YOF included in the  $\text{ZrO}_2$ - $\text{YF}_3$ - $\text{YO}_{1.5}$  ternary system, samples of 3.0-7.7 mol% YOF within the region of tetragonal single phase at 1300°C were isostatically hot pressed at 1200°, 1300° and 1450°C under 200 MPa for 3 h. For  $\text{ZrO}_2$ -7.7 mol% YOF, a metastable tetragonal zirconia single phase was obtained as a sintered body. For other samples (> 7.7 mol% YOF) most of the tetragonal phase transformed diffusionlessly to a monoclinic phase during cooling. According to measurement by DTA, the tetragonal phase in the  $\text{ZrO}_2$ -YOF system transformed at higher temperatures than that in the  $\text{ZrO}_2$ - $\text{YO}_{1.5}$  system. This seems to be caused by more distorted cells of the tetragonal and monoclinic phases as the result of F<sup>-</sup> doping. Stress induced transformation is confirmed for the metastable tetragonal phase. (Edited author abstract) In Japanese. 5 refs.

**089443 BONDING OF Y-PSZ WITH Ti-10 WT% CO BINARY MIXED POWDER COMPACT BY LIQUID PHASE SINTERING.** Using Ti-10 wt% Co binary mixed powder compact as the insert material, bonding behavior of Y-PSZ was examined under the coexistence of solid and liquid by liquid phase sintering. Bonding was carried out at 1473 K for 3.6 ks under pressure of 1-9 MPa by hot pressing. The highest bending strength of 213 MPa was achieved in the specimen bonded under 3 MPa. There were large grains in the center region of Ti-Co alloy after bonding, while near the Y-PSZ/Ti-10% Co interface small grains were observed. The interfacial strength between Y-PSZ and Ti-Co alloy is assumed to be higher. (Edited author abstract) In Japanese. 8 refs.

**089444 STRUCTURAL STUDIES ON THE  $\text{ZrO}_2$ - $\text{Y}_2\text{O}_3$  SYSTEM BY ELECTRON DIFFRACTION AND ELECTRON MICROSCOPY III.** The oxygen-ion displacements in modulated structures for 10-50 mol%  $\text{Y}_2\text{O}_3$ - $\text{ZrO}_2$  can be assigned in terms of the frozen in distortions of the molecular vibrational modes of an oxygen ion cube. This assignment clarifies that the displacement of the 10 mol%  $\text{Y}_2\text{O}_3$ - $\text{ZrO}_2$  structure type (a deformed fluorite structure) decreases and that of the  $\text{Y}_2\text{O}_3$  structure type increases as the amount of  $\text{Y}_2\text{O}_3$  increases. The displacement of the  $\text{Y}_2\text{O}_3$  type already occupies 75% in 20 mol%  $\text{Y}_2\text{O}_3$ - $\text{ZrO}_2$  and 97% in 50 mol%  $\text{Y}_2\text{O}_3$ - $\text{ZrO}_2$  in the microdomains of modulated structures. The decrease of the ionic conductivity with the content of  $\text{Y}_2\text{O}_3$  can be attributed to an increase in the volume of microdomains with the  $\text{Y}_2\text{O}_3$ -type displacement. The arc-shaped diffuse scattering observed in 20 and 40 mol%  $\text{Y}_2\text{O}_3$ - $\text{ZrO}_2$  originates from the presence of various orientations and different intervals of the periodic anti-phase boundaries. **089445 INFRARED STUDY OF SULFATED ZIRCONIA.** Fourier transform infrared spectroscopy and vacuum microbalance methods have been used to study the sulfation of zirconium oxide. Sulfation could be carried out by oxidizing either  $\text{H}_2\text{S}$  or  $\text{SO}_2$  in excess  $\text{O}_2$  at 450°C and the infrared spectrum showed an intense three component band near 1375  $\text{cm}^{-1}$  accompanied by a complex profile having at least six components between 1100 and 800  $\text{cm}^{-1}$ . Two surface sulfate species were formed after oxidation of between 10 and about 250  $\mu\text{mol g}^{-1}$ , and although the extent of formation of each was dependent on the quantity oxidized, the total band area between 1400 - 1350  $\text{cm}^{-1}$  was a linear function of the quantity of  $\text{H}_2\text{S}$  or  $\text{SO}_2$  introduced into the infrared cell. Both species contain a single SO oscillator and their structures are possibly of the type  $(\text{ZrO}_3)\text{SO}$  resident on different crystal faces of  $\text{ZrO}_2$ . A third species is formed at higher coverages and its suggested structure is a  $\text{S}_2\text{O}_7$  type species in which four of the oxygen atoms are bonded to surface Zr atoms, there being one SOS bridge and two uncoupled SO oscillators. All three sulfate species have similar thermal stabilities (decomposition between 600 and 800°C) and are reduced at the same rate in hydrogen (the IR bands disappear rapidly between 450 and 475°C). Finally, sulfation could also be carried out via impregnation of  $\text{ZrO}_2$  with  $\text{H}_2\text{SO}_4$ ,  $(\text{NH}_4)_2\text{SO}_4$  or  $\text{Zr}(\text{SO}_4)_2$  followed by heating under vacuum at 450°C. **089446 TRANSFORMATION TOUGHENING IN LARGE-GRAIN-SIZE  $\text{CeO}_2$ -DOPED  $\text{ZrO}_2$  POLYCRYSTALS.** The fracture and transformation behavior of tetragonal polycrystalline  $\text{ZrO}_2$  alloys containing 18 mol%  $\text{CeO}_2$  (Ce-TZP) was investigated. In the absence of applied stress the tetragonal phase was found to be stable in large-grained samples at room temperature. The monoclinic phase was detected in regions of high residual stress near hardness indentations although no evidence of a wake of monoclinic phase along the fracture surface was observed. (Edited author abstract) 38 refs.

**089448 SYNTHESIS OF THE ORTHORHOMBIC PHASE OF  $2Y \cdot ZrO_2$ .** A mixture of tetragonal and monoclinic  $2Y \cdot ZrO_2$  powder was treated from 400° to 800°C and from 4 to 7 GPa for 30 min. The products were identified by powder XRD, Raman spectroscopy, and TEM. Results indicated that an orthorhombic phase was synthesized at  $T = 400^\circ$  to  $600^\circ C$ . The orthorhombic phase always coexisted with the tetragonal phase in the products. The amounts of the tetragonal phase before and after treatment remained largely unchanged, whereas the amount of new orthorhombic phase was nearly the same as the decreased amount of the monoclinic phase. **089449 PREPARATION OF MONODISPersed Y-DOPED  $ZrO_2$  POWDERS.** 3 mol% Y-doped  $ZrO_2$  powders prepared by the controlled hydrolysis of metal alkoxides were monodispersed and grown to 0.5  $\mu m$  after 5 h ageing. The as-prepared powder was amorphous and hydrated but transformed into a tetragonal single phase by heating. Furthermore, the  $Y_2O_3$  concentration of each particle was almost the same in all particles. The synthesis conditions such as ageing time, ageing temperature and water concentration greatly affected the particle morphology. The refluxing of the alkoxide solution was particularly necessary to prepare the monodispersed particles. On the basis of the variation of size distribution with ageing time, the mechanism of particle growth was discussed. (Author abstract) 16 refs.

**089450 LOW TEMPERATURE PHASE EQUILIBRIA AND ORDERING IN THE  $ZrO_2$ -RICH REGION OF THE SYSTEM  $ZrO_2$ -CaO.** From co-precipitated powder samples, the solid state reactions occurring between room temperature and 1500°C in the  $ZrO_2$ -CaO system have been studied. At low temperatures, compositions containing <25 mol% CaO show a complex picture of phase transformation and ordering in the system. From the obtained results the singular reactions have been established. By using DTA, X-ray diffraction and SEM techniques, the extent of the tetragonal and cubic zirconia solid solution fields has been established. From the above experimental results a new tentative phase diagram is given for the  $ZrO_2$ -rich region of the system,  $ZrO_2$ -CaO. (Edited author abstract) 19 refs.

**089451 YTTRIA MIGRATION IN Y-TZP DURING HIGH-TEMPERATURE ANNEALING.** The microstructural and phase changes occurring during the high temperature (1300 to 1550°C) annealing of tetragonal yttria-zirconia (Y-TZP) were studied using X-ray fluorescence, X-ray diffraction, and TEM. Two processes occurred simultaneously involving the diffusion of yttrium. The Y-TZP partitioned into yttria-rich and yttria-poor phases throughout the material, because the material lies in a two-phase field of the yttria-zirconia phase diagram. The other process involved the segregation of yttrium to the surface, the extent of which was shown to vary with the state of the surface (ground or polished), annealing temperature, and silica content. Migration of yttrium to the surface caused a significant surface composition change (i.e. from 4.7 wt%  $Y_2O_3$  at room temperature to 8.9 wt%  $Y_2O_3$  at 1550°C for 3 h), resulting in a

microstructure and phase composition different from the bulk. (Author abstract) 6 refs.

**089452 DEVELOPMENT OF DOMAIN STRUCTURE ASSOCIATED WITH THE DIFFUSIONLESS CUBIC-TO-TETRAGONAL TRANSITION IN  $ZrO_2$ - $Y_2O_3$  ALLOYS.** Microstructural change associated with the diffusionless cubic-to-tetragonal (c-t) transition was examined in arc-melted  $ZrO_2$ - $Y_2O_3$  alloys with yttria content 3 to 5 mol%. It was found that a two-step microstructural change occurred during the transition. A domain structure with antiphase domain boundary-like contrast is formed initially and plate-like or lenticular features later. The domain size decreases with increasing yttria content of the alloy. The change of domain size seems to be related to the change in  $T_0$  temperature with composition. The nature of the c-t transition is discussed in this paper. (Author abstract) 16 refs.

**089453 METASTABLE RETENTION OF A HIGH-PRESSURE PHASE OF ZIRCONIA.** A high-pressure phase of zirconia, stable above 3.3 GPa at room temperature, can be retained metastably, at ambient room conditions of pressure and temperature by appropriate thermal/pressure treatments. The amount of high-pressure phase retained depends on the thermal treatment, hydrostatic environment, and particle size of the starting powder. The results support the idea that the high-pressure transformation in zirconia is initiated at nucleation centers whose population can be minimized by appropriate thermal treatments. The results also point out the importance of high pressure as a source of controllable driving force to induce the transformation in zirconia, thus permitting the use of annealing treatments to change the population of defects involved in nucleating the transition. (Author abstract) 15 refs.

**089454 TOUGHENING BEHAVIOR INVOLVING MULTIPLE MECHANISMS: WHISKER REINFORCEMENT AND ZIRCONIA TOUGHENING.** Since the contribution of transformation toughening increases with the local crack resistance (which is proportional to the toughness of the matrix),  $ZrO_2$  particles were added to a toughened, whisker-reinforced ceramic matrix. Analysis revealed that the combination of these multiple toughening agents should result in ceramic composites tougher than that achieved by either mechanism by itself, or the sum of the two processes. The toughness of mullite could be increased 1.8- and 2.4-fold with a 20 vol% addition of  $ZrO_2$  particles or SiC whiskers, respectively. However, when 20 vol% of both  $ZrO_2$  particles and SiC whiskers were added, the toughness was increased at least 3-fold with monoclinic m- $ZrO_2$  and by >5-fold with tetragonal t- $ZrO_2$ . (Edited author abstract) 6 refs.

**089455 LOW-TEMPERATURE AGING OF t- $ZrO_2$  POLYCRYSTALS WITH 3 mol%  $Y_2O_3$ .** A kinetic study of the aging behavior of tetragonal zirconia polycrystals (TZPs) from 100°C suggests that there exists a critical grain size of 0.52  $\mu m$  below which the tetragonal symmetry can be retained. Property degradation of TZPs at low temperatures is connected with transformation-induced microcracking. It is reported here that the temperature range of 100° to 400°C in which degradation occurs could be explained by an infinite incubation time for the lower limit and by the martensite starting temperature for the upper limit. **089456 STABILITY OF TETRAGONAL  $ZrO_2$  PHASE IN  $Al_2O_3$  PREPARED FROM Zr-Al ORGANOMETALLIC COMPOUNDS.** Zr-Al organometallic compounds have been spray-dried and heated at temperatures 600 to 1400°C to prepare  $ZrO_2$ - $Al_2O_3$  composite powders. The powders consist of balloon-like particles 0.5 to 2  $\mu m$  in diameter with homogeneously dispersed tetragonal  $ZrO_2$  grains 0.1 to 0.2  $\mu m$  in diameter. The tetragonal fraction of  $ZrO_2$  in the composite powders is higher than that in the powders prepared from sols of  $Zr(OBu)_4$  and  $Al[OCH(CH_3)_2]_3$ . The fraction is affected by the organofunctional group in the Zr-Al compounds. (Author abstract) 14 refs.

**089457 COMMENT ON 'A STRUCTURAL STUDY OF METASTABLE TETRAGONAL ZIRCONIA IN AN  $Al_2O_3$ - $ZrO_2$ - $SiO_2$ - $Na_2O$  GLASS-CERAMIC SYSTEM.'** In a publication on the study of crystallization of gels in an  $Al_2O_3$ - $ZrO_2$ - $SiO_2$ - $Na_2O$  glass-ceramic system, Fagherazzi et al. obtained a sharp exothermic peak at about 940°C in the differential thermal analysis (DTA) curve which they ascribe to the crystallization of tetragonal zirconia. The author has reproduced the experiment and obtained a similar sharp exothermic peak at about 955°C. X-ray diffraction results at this temperature revealed that presence of strong tetragonal zirconia peaks plus medium peaks at high angles of the cubic spinel phase and weak peaks at 2 $\theta$  which Osaka ascribed to the formation of a metastable (2:1) mullite phase. The sharp exotherm as obtained by Fagherazzi et al. could not possibly be due to the crystallization of zirconia, but the metastable mullite phase instead. The apparent broad and diluted exotherm just prior to the sharp peak as obtained by the author is consequently ascribed to the crystallization of tetragonal zirconia. 8 refs.

**089459 TRANSFORMATION PLASTICITY OF  $CeO_2$ -STABILIZED TETRAGONAL ZIRCONIA POLYCRYSTALS: I. STRESS ASSISTANCE AND AUTOCATALYSIS.** Transformation plasticity in  $CeO_2$ -stabilized tetragonal zirconia polycrystals due to the tetragonal-to-monoclinic transformation was studied by inducing volumetric and shear deformation under compression and bending between the burst temperature of martensite (monoclinic) formation ( $M_b$ ) and the burst temperature of austenite (tetragonal) formation ( $A_b$ ). The stress-strain curve features a load drop, a perfect plastic regime, and an extended strain-hardening regime before the exhaustion of transformation. Macroscopic shear bands formed in the perfect plastic regime. The yield stress has a strong, positive pressure and temperature sensitivity but is strain-rate sensitive only in the last stage of deformation. These results are rationalized in terms of stress assistance to the transformation which, in a homogeneous tetragonal polycrystal, may propagate autocata-

lytically. Autocatalysis can be impeded by a second phase, such as monoclinic  $ZrO_2$  or  $Al_2O_3$ , and is suppressed at higher temperature. (Edited author abstract) 24 refs.

**089461 POLYMORPHIC MIXES OF ZIRCONIA FROM A BORATE GLASS MELT.** Yttria-stabilized zirconia crystals were produced by devitrification within a sodium borate glass containing zirconia and yttria. Yttria (3, 6, or 10 mol%) in zirconia was added as part of the starting material of the glass batch. Phase separation and crystallization occurred during the cooling and subsequent heat treatment of the glasses. The zirconia powders obtained after leaching away the sodium borate had surface areas between 16 and 48  $m^2/g$ . X-ray diffraction traces revealed a mixture of monoclinic, tetragonal, and cubic phases, the phase ratios of which depended on the composition of the glass. (Author abstract) 7 refs.

**089463 LOCAL STRUCTURES AROUND Y ATOMS IN  $Y_2O_3$ -STABILIZED TETRAGONAL  $ZrO_2$ .** Local structures around  $Y^{3+}$  ions in stabilized tetragonal  $ZrO_2$  with the chemical compositions of 94  $ZrO_2 \cdot 6 YO_{1.5}$  (Y 6) and 86  $ZrO_2 \cdot 4 YO_{1.5} \cdot 10 CeO_2$  (Y 4) were studied by Y K EXAFS (extended X-ray absorption fine structure) analysis. Using  $Y_2O_3$  crystals (Y-O=2.28 Å, six-fold coordination) as a reference sample, average Y-O distances for Y 6 and Y 4 samples were estimated to be 2.31 and 2.35 Å, respectively, by the curve-fitting method. Y atoms in the tetragonal zirconias seem to locate at seven-fold coordination sites, judging from the atomic distances. The average Y-cation distances for Y 6 and Y 4 samples were calculated to be 3.70 and 3.73 Å, respectively. They are longer than the average cation-cation distances calculated from the lattice dimensions, but shorter than the average Y-Y distance of 3.77 Å in the  $Y_2O_3$  crystals. A  $Zr_7Y_2O_7$  cluster was proposed as a model for local structures around  $Y^{3+}$  ions. (Edited author abstract) 25 refs. In Japanese.

**089464 EFFECTS OF HIGH-TEMPERATURE-AND HIGH-PRESSURE-WATER ON THE LOW**

**TEMPERATURE DEGRADATION BEHAVIOUR OF Y-TZP.** The effects of high-temperature (200°-800°C)- and high-pressure (5 or 100 MPa)-water on the low-temperature degradation behavior of Y-TZP were investigated. Tetragonal (t) to monoclinic (m) transformation is markedly accelerated by the existence of water, under the hydrothermal condition at 200°-300°C, the surface of the specimen is spalled by the stress accompanied by the expansion of t-m transformation. The spalled layers and the surfaces of the unspalled bulk specimen consist of almost m-phase ( $\approx 90$  vol%). From SEM observation on these specimens, large cracks occurred from the corner of the specimen by the stress concentration, and then they propagated parallelly to the surface of the specimen and caused the spalling. (Edited author abstract) 17 refs. In Japanese.

**089465 FRACTURE BEHAVIOR OF  $Y_2O_3$  DOPED TETRAGONAL ZIRCONIA POLYCRYSTALS.** This paper discusses the relationships between some mechanical properties and fracture behavior in Y-TZP. Test specimens of Y-TZP were prepared by sintering powder produced by the solution technique, and their mechanical properties were measured and the stress-induced transformation on the fracture surface was analysed by Raman spectroscopy. The monoclinic phase ratio on the fracture surface was correlated with bending strength but not with the critical stress intensity factor. A distinct difference was observed in the morphology of the fracture surface between specimens with strength higher and lower than 80 kg/mm<sup>2</sup>. (Edited author abstract) 14 refs. In Japanese.

**089466 EFFECT OF HIGH PRESSURE TREATMENT ON THE MECHANICAL PROPERTIES OF Y-TZP.** TZP (tetragonal zirconia polycrystal), has a higher toughness than pure  $ZrO_2$ . In the present work,  $Y_2O_3$ -doped TZP (Y-TZP) was treated at high pressure and the mechanical properties (hardness and toughness) were examined. The volume fraction of the monoclinic phase ( $V_m$ ) was about 20%; however, the  $V_m$  of the high pressure treated specimens (except the specimens treated at room temperature) was low, e.g. 7% for the specimen treated at 5 GPa, 1400°C. Therefore, the effect of the stress-induced transformation did not contribute to the toughening. X-ray diffraction analysis showed that residual stress accumulated in the tetragonal lattice after the high pressure treatment. The residual (compressive) stress could be considered an agent of the toughness improvement. 13 refs.

**089467 OBTENTION OF Y-TZP WITH TRANSFORMABLE GRAINS AT ROOM TEMPERATURE FOR IMPROVED MECHANICAL PROPERTIES.** The development of engineering ceramics utilizing zirconia relies on the stability of tetragonal precipitates. The stress-induced tetragonal to monoclinic  $ZrO_2$  martensitic transformation is characterized by  $M_s$ , the temperature at which the transformation begins (upon cooling) in the absence of an applied stress. Accordingly, the maximum toughness attainable at room temperature by Y-TZP (tetragonal zirconia polycrystalline stabilized by yttria) will be reached for a value of  $M_s$  close to room temperature. In this paper it is shown how it has been possible to obtain Y-TZP with a martensitic start temperature as low as 50°C. The authors used a fine-grained commercial powder doped with 1.5 and 2 mol%  $Y_2O_3$ . 6 refs.

Bastide, B. (CRICERAM, Jarrie, Fr); Odier, P.; Coutures, J.P. *J Mater Sci Lett* v 7 n 3 Mar 1988 p 289-290.

**089468  $ZrO_2$  TRANSFORMATION TOUGHENING CRITERIA.** Transformation toughening influences toughness by means of  $ZrO_2$  phase transformation in a process zone. The micromechanisms of events occurring prior to the  $ZrO_2$  phase transformation are poorly understood and have not been reported in the literature. This letter elucidates the micromechanisms of phase transformation in the process zone and highlights the criteria that must be compiled with before phase transformation of metastable  $ZrO_2$  particles can be achieved. A suitable matrix for transformation toughening should possess a high yield strength ( $\geq 450$  MPa), a close match in elastic modulus with  $ZrO_2$  and a strong interfacial bond strength or shear strength. 16 refs.

**089469 NATURE AND EFFECTS OF DEFECTS INTRODUCED DURING FABRICATION OF ZIRCONIA ENGINEERING CERAMICS.** Zirconia engineering ceramics are naturally brittle, but have a toughness superior to other ceramic materials. Whereas their toughness can be controlled by both choice of composition and heat treatment, the strength is determined by the flaw size in combination with the toughness. The generation of individual flaws during all stages of the manufacturing process, from powder preparation and compaction by various routes through sintering and final machining, largely determines the final flaw population. Often flaws characteristic of the individual process stages can be identified, and some will be described. Methods for minimising the effectiveness of such flaws will be discussed with a view to optimising mechanical properties. (Author abstract) 13 refs.

**089470 THERMAL DIFFUSIVITY OF PARTIALLY AND FULLY STABILIZED (YTTRIA) ZIRCONIA SINGLE CRYSTALS.** Laser flash measurement of thermal diffusivity of  $ZrO_2$  single crystals partially and fully stabilized with  $Y_2O_3$  were compared with measurements for polycrystalline cubic  $ZrO_2$ , and single crystals and polycrystals of  $Al_2O_3$  and  $MgAl_2O_4$ . In general, the thermal diffusivities of the  $ZrO_2$  materials examined initially decrease with increasing temperature. (Edited author abstract) 30 refs.

**089471 ERRORS IN ELASTIC CONSTANT MEASUREMENTS IN SINGLE CRYSTALS.** A general analysis is presented of the errors involved in calculations of the elastic constants of single crystals from wave speed measurements. Results are presented graphically for the most probable errors, misorientation of the single-crystal samples for the wave speed measurements. Specific numerical results are presented for elastic constants typical of yttria-stabilized zirconia single crystals. (Edited author abstract) 36 refs.

**089472 ELASTIC ANISOTROPY IN ZIRCONIA SINGLE CRYSTALS.** Results are presented for the measured single-crystal elastic constants of yttria-stabilized zirconia, for yttria contents of 1.7 to 20 mol%. The results cover a range of materials which vary from a mixture of monoclinic, tetragonal, and cubic to those which are fully cubic. These single-crystal measurements are used to calculate the bounds on the elastic moduli for polycrystalline materials. Comments are made on the

elastic anisotropy of zirconia relative to a number of other single-crystal ceramics. (Edited author abstract) 43 refs.

**089473 DEHYDRATION OF HYDROUS ZIRCONIA WITH METHANOL.** The washing of hydrous zirconia with alcohols to reduce the incidence of hard agglomerates on subsequent drying is well known. The results of methanol dehydration of hydrous zirconia (zirconium hydroxide),  $[\text{Zr}_2(\mu\text{-OH})_2(\text{OH})_2(\text{H}_2\text{O})_2] \cdot x\text{H}_2\text{O}$ , show that only  $\mu\text{-OH}$  groups are unaffected. This suggests two things: First, the removal of nonbridging hydroxyl groups and water with alcohols such as methanol leads to a reduction/elimination of hard agglomerates. Second, hard agglomerate formation is associated with condensation reactions. (Edited author abstract) 16 refs.

**089474 TWINNING AND MICROCRACKING ASSOCIATED WITH MONOCLINIC ZIRCONIA IN THE EUTECTIC SYSTEM ZIRCONIA-MULLITE.** Crystallography and morphology of twins and microcracks in the eutectic system mullite-zirconia are discussed in view of the tetragonal-to-monoclinic transformation and associated toughening mechanisms. Specific twin relationships were observed in monoclinic  $\text{ZrO}_2$ . Microdiffraction revealed closely related crystallography of monoclinic twins and microcracks. The number of twin variants depend on the monoclinic  $\text{ZrO}_2$  particle size. A method to calculate twinning shear strain using microcrack morphology is suggested. (Edited author abstract) 8 refs.

**089475 FORMATION OF ZIRCONIA FIBRES ON UNIDIRECTIONAL FREEZING OF A GEL.** A zirconia hydrogel prepared by dialysing  $\text{ZrOCl}_2$  aqueous solution against water buffer was unidirectionally frozen in a cylindrical polyethylene cell which was immersed in a  $-78^\circ\text{C}$  cold bath at various rates. Freezing rate,  $R$ , and temperature gradient,  $G$ , at the frozen gel front were continuously measured during freezing. It was found that zirconia fibers longer than 20 mm are formed when  $G/R = 2$  to  $8^\circ\text{C h cm}^{-2}$ . Either lower or higher  $G/R$  values gave only fragmental zirconia. The results were interpreted in terms of cellular growth of ice crystals. (Edited author abstract) 6 refs.

**089476 RHEOLOGICAL AND TECHNOLOGICAL PROPERTIES OF ZIRCONIA SUSPENSIONS STABILIZED WITH VARIOUS AMOUNTS OF CALCIUM OXIDE.** The authors identified the influence of the phase composition on the nature of the rheological curves. They studied the rheological properties of calcium zirconate and identified the optimum conditions for casting water suspensions. The change in the rheological properties of the suspensions is interpreted from the viewpoint of the magnitude of hydration and kinetically bonded liquid. There is a link between the rheological properties of the heterophase suspensions and the change in  $\zeta$ -potential. The change in the rheological properties of the suspension by means of small amounts of surface active agents of the organic alcohol types in the optimum pH range makes it possible to obtain articles with outstanding properties, including those from compositions containing  $\text{CaO}$  up to calcium zirconate. 13 refs.

**089478 PROPERTIES OF THE FLUORITE-TYPE SOLID SOLUTIONS IN THE  $\text{ZrO}_2\text{-HfO}_2\text{-CaO}$  SYSTEM AND MATHEMATICAL PROCESSING OF THE EXPERIMENTAL RESULTS.** The authors determined the X-ray and pycnometric density levels of fluorite-type solid solutions of the  $\text{ZrO}_2\text{-HfO}_2\text{-CaO}$  system. It is shown that for the solid solutions in the ternary system, electroneutrality of the lattice is retained during the substitution of the ions of zirconium and hafnium owing to the formation of anion vacancies. The equations of the regression lines were obtained and the correlation coefficients were calculated. These equations describe the linear dependence of the density, coefficient of linear thermal expansion and melting points on the concentration of the additives. 5 refs.

**089479 ACID WASHING OF MILLED STABILIZED ZIRCONIA AND ITS INFLUENCE ON THE PROPERTIES OF CERAMICS.** Ceramics made from tetragonal zirconia possess high toughness and impact strength. The most effective technology for their production is slip casting. The slip is obtained by wet milling of powdered solid solutions based on zirconia in a water medium using steel ballmills followed by solution of the tramp iron in HCl. In this paper the authors studied the influence of the form and amount of acid on the completeness of removing the tramp iron. The most promising of the acids studied is HCl (in respect to density of the slip and strength of the specimens). In order of decreasing effectiveness are acetic, perchloric, nitric, H<sub>2</sub>SO<sub>4</sub> and oxalic acid. 6 refs.

**089480 SINTERING OF 3 MOL%  $\text{Y}_2\text{O}_3\text{-TZP}$  AND ITS FRACTURE AFTER AGEING TREATMENT.** TZP ceramic of 99.7% theoretical density was obtained by pressureless sintering a commercial co-precipitated 3 mol%  $\text{Y}_2\text{O}_3\text{-ZrO}_2$  powder at  $1400^\circ\text{C}$  for 10 h. Fracture surfaces of the aged material revealed that the fracture was typified by an intergranular mode in areas where the phase was mainly tetragonal, whereas the transgranular mode was found predominantly in the area containing more monoclinic phase. Microcracks induced by the (t)  $\rightarrow$  (m) transformation provided short paths for water to accelerate the property degradation of TZP on low-temperature ageing in a humid atmosphere. (Author abstract) 29 refs.

**089481 TRANSFORMATION ZONE SHAPE IN CERIA-PARTIALLY-STABILIZED ZIRCONIA.** Observations of the steady-state transformed zone around a quasistatically grown crack in Ce-TZP are reported for various temperatures between  $-40$  and  $100^\circ\text{C}$ . At room temperature, the zone length ahead of the crack is  $200\text{ }\mu\text{m}$ , which is larger than the zone height of  $40\text{ }\mu\text{m}$ . At lower temperatures, shear bands emanating from the crack tip extend to a few millimeters at the lowest temperature investigated ( $-40^\circ\text{C}$ ). A modification of the DBCS model of plastic yielding is presented using a collinear array of

half-lines of strain to represent the room temperature transformed zone. The shear component of the transformation strain does not affect the toughening due to such collinear zones. Estimates of the critical transformation stress and volume fraction transformed compare favourably with experimental data. Some implications for the modelling of transformation-induced plasticity are briefly discussed. (Edited author abstract) 29 refs.

**089482 PREPARATION AND THERMAL EVOLUTION OF SOL-GEL DERIVED TRANSPARENT  $\text{ZrO}_2$  AND  $\text{MgO-ZrO}_2$  GEL MONOLITH.** Transparent gel monoliths of pure and  $\text{MgO}$ -doped zirconia having dopant concentrations in the range 0 to 15 mol% were prepared by chemical polymerization of zirconium n-propoxide and magnesium acetate tetrahydrate using 2-methoxy ethanol as solvent. The thermal evolution was studied by differential thermal analysis, X-ray diffraction and transmission electron microscopy. The crystallization of pure and doped zirconia gels occurred in the temperature range  $360$  to  $450^\circ\text{C}$ . The first crystalline phase to appear is tetragonal for pure and 2 mol% doped zirconia and cubic for 3 to 15 mol% doped samples. Both crystallization and decomposition temperatures increase with increasing dopant concentration, approaching a saturation value for 10 mol% doped samples. Transformation of the cubic to the monoclinic phase takes place via a metastable tetragonal phase. A linear relationship between the lattice parameter of cubic zirconia and  $\text{MgO}$  concentration has been established. X-ray diffraction studies have also revealed that the entire amount of  $\text{MgO}$  used in preparing doped zirconia gels remains in a single  $\text{MgO-ZrO}_2$  crystalline phase formed initially by thermal treatment. (Author abstract) 42 refs.

Kundu, P. (Central Glass & Ceramic Research Inst, Calcutta, India); Pal, D.; Sen, Suchitra. *J Mater Sci* v 23 n 5 May 1988 p 1539-1546.

**089483 MECHANICAL PROPERTIES AND MICROSTRUCTURES OF CO-PRECIPITATION DERIVED TETRAGONAL  $\text{Y}_2\text{O}_3\text{-ZrO}_2\text{-Al}_2\text{O}_3$  COMPOSITES.**  $\text{Y-TZP-Al}_2\text{O}_3$  specimens (2.5 mol%  $\text{Y}_2\text{O}_3\text{-ZrO}_2$  and 5 to 30 wt%  $\text{Al}_2\text{O}_3$ ) were prepared from coprecipitated powders and their mechanical properties were studied. The addition of alumina improves the density after sintering at  $1500^\circ\text{C}$  and reduces the degradation of their densities due to porosity formation when the materials are sintered above  $1500^\circ\text{C}$ . Near theoretical density could be achieved for most of the samples after HIPing at  $1500^\circ\text{C}$  for  $\frac{1}{2}$  h at 200 MPa pressure. The fracture strength of the HIPed specimens was in the range 2.0 to 2.4 GPa and the stress intensity factor was in the range 3.5 to 6.0  $\text{MPa m}^{1/2}$ . The mechanical strength was not degraded seriously after autoclaving in water at  $175^\circ\text{C}$  for 24 h. The surface layer of transformed monoclinic zirconia was less than  $70\text{ }\mu\text{m}$  thick even after autoclaving at  $175^\circ\text{C}$  for 5 days. (Author abstract) 32 refs.

**089484 PREPARATION OF  $\text{ZrO}_2\text{-Y}_2\text{O}_3\text{-Fe}_2\text{O}_3$  FILMS BY A RI-CO-SPUTTERING METHOD.** The single monoclinic and tetragonal phase appeared for  $<0.2$  mol percent and  $>3.6$  mol percent ( $\text{Y}_2\text{O}_3\text{-Fe}_2\text{O}_3$ ), respectively. The monoclinic and tetragonal mixed phase with the same ( $\text{Y}_2\text{O}_3\text{-Fe}_2\text{O}_3$ ) content appeared for 0.2-3.6 mol percent ( $\text{Y}_2\text{O}_3\text{-Fe}_2\text{O}_3$ ). The single monoclinic and tetragonal phase were stable during aging between  $673\text{-}1473\text{ K}$  in air. In the mixed phase films, the tetragonal phase transformed isothermally to the mono-

clinic phase without ( $Y_2O_3 + Fe_2O_3$ ) content change during aging between 1073-1473 K in air. (Edited author abstract). 6 Refs. In Japanese.

**089486 FORMATION OF A ZINC OXIDE/YTTRIA-STABILIZED ZIRCONIA INTERFACE.** Zinc oxide was deposited on the (111) face of an yttria-stabilized zirconia single crystal using the chemical vapor phase method. Zinc vapor was obtained by reducing polycrystalline ZnO in hydrogen at 1200°C. The deposition of the ZnO was accomplished by the reoxidation of zinc vapor at temperatures of 1300° to 1345°C. (Author abstract). 2 Refs.

Schneider, Susan C. (Marquette Univ, Milwaukee, WI, USA); Seitz, Martin A.; Choudhury, Apurba. *J Am Ceram Soc* v 71 n 7 Jul 1988 p C.321-C.322.

**089487 DOMAIN SWITCHING AS A TOUGHENING MECHANISM IN TETRAGONAL ZIRCONIA.** Evidence for a toughening contribution from domain switching, a deformation mode akin to twinning, has been sought in uniaxial tension and compression, biaxial compression, and on the fracture surfaces of several tetragonal zirconia polycrystalline (TZP) ceramics. Only in biaxial compression was domain switching found. In other cases, textures of both the tetragonal and monoclinic phases were due to stress coupling with transformation shear strain. The lower bound of the critical stress for domain switching is placed at the bend strength of TZP, which can exceed 1000 MPa. Although thermal activation may lower the critical stress sharply, at lower temperatures, domain switching is not likely to be an important toughening mechanism. (Author abstract). 23 Refs.

upon Tyne, Engl); Thompson, D.P. *Br Ceram Trans J* v 87 n 3 May-Jun 1988 p 107-110.

**089490 MODIFICATION OF INDENTATION CRACK IN TZP CERAMICS BY THERMAL TREATMENT.** Crack healing and crack tip rounding can occur if the indented specimens are treated above the  $ZrO_2(t) \rightarrow ZrO_2(m)$  transformation temperature therefore fracture strength recovery can be achieved. The mechanisms responsible for the crack healing and crack tip rounding are suggested to include both deformation and diffusion at the treatment temperature. The grain rearrangement caused by the  $ZrO_2(m)$  YLD  $ZrO_2(t)$  transformation in the crack opening process zone may also be responsible for crack healing and crack tip rounding during thermal treatment. The transformation-induced compressive stress is thought to be released during the annealing and this may have a negative effect on recovery of fracture strength. 21 Refs.

Wang, J. (Univ of Leeds, Leeds, Engl); Stevens, R. *J Mater Sci Lett* v 7 n 6 Jun 1988 p 560-562.

**089491 ROLE OF INTERFACE-CONTROLLED DIFFUSION CREEP ON SUPERPLASTICITY OF YTTRIA-STABILIZED TETRAGONAL  $ZrO_2$  POLYCRYSTALS.** In order to identify the deformation mechanism of superplasticity in Y-TZP, deformation parameters were determined by tension and tensile creep tests. This letter presents a model in which it is assumed that superplasticity of fine-grained materials is related to interface-controlled diffusion creep, while materials with a large grain size are deformed by Nabarro-Herring creep. The material was fabricated by sintering coprecipitated  $ZrO_2$  powder containing 2 mol percent  $Y_2O_3$ . If the model is correct, pure diffusional creep will be observed in the limited case of large grain size or in the case of very slow cation diffusivity. The effective lattice diffusivity for creep had a value of  $1.88 \times 10^{-11} \text{ cm}^2 \text{ sec}^{-1}$  at 1450°C. 23 Refs.

Wakai, Fumihiko (Government Industrial Research Inst, Nagoya, Jpn); Nagono, Takayuki. *J Mater Sci Lett* v 7 n 6 Jun 1988 p 607-609.

**089492 SUPERPLASTIC PROPERTIES OF A FINE-GRAINED YTTRIA-STABILIZED TETRAGONAL POLYCRYSTAL OF ZIRCONIA.** Yttria stabilized tetragonal Zirconia polycrystal, Y-TZP, was subjected to high temperature tensile tests in a vacuum ( $10^{-3}$  Pa). Superplasticity in fine-grained Y-TZP, as first reported by F. Wakai et al. has been demonstrated to be reproducible. In addition, a high elongation value of 350 percent has been obtained at 1550°C. The microstructure of the Y-TZP appears to be stable at 1450°C but grain growth takes place in specimens tested at 1550°C. 12 Refs.

**089493 STABILIZATION OF ZIRCONIA SINTERED WITH TITANIUM.** Electron and X-ray diffraction studies show that zirconia sintered with 5 to 15 mol% titanium under a vacuum of  $10^{-1}$  to  $10^{-2}$  torr was partially stabilized as cubic and tetragonal phases, whose amounts increase with increasing Ti content. The stabilization of  $ZrO_2$  is due to the dissolution of TiO which forms as a second phase in the sintered specimen. The grain size of  $ZrO_2$  decreases with increase in Ti. (Edited author abstract). 17 Refs.

**089494 TRANSFORMATION PLASTICITY OF  $CeO_2$ -STABILIZED TETRAGONAL ZIRCONIA POLYCRYSTALS: II, PSEUDOELASTICITY AND SHAPE MEMORY EFFECT.** A macroscopic shape memory effect is demonstrated by first deforming a  $CeO_2$ -stabilized tetragonal zirconia polycrystal ( $Ce$ -TZP) between the  $M_b$  and  $A_b$  temperatures and then recovering the shape changed by heating above  $A_b$ . Shape changes

effected above  $A_b$  are immediately recoverable during unloading, giving rise to a pseudoelastic behavior. Deformation texture is reversible when the shape strain recovers. The operation of pseudoelasticity and shape memory effect is rationalized in terms of martensitic nucleation statistics, the stability of thermoelastic martensite, and internal stresses at the martensitic interface. The implications on transformation plasticity and transformation toughening are explored. (Edited author abstract). 32 Refs.

Reyes-Morel, Patricio E. (Univ of Michigan, Ann Arbor, MI, USA); Cherng, Jyh-Shiarn; Chen, I-Wei. *J Am Ceram Soc* v 71 n 8 Aug 1988 p 648-657.

**089495 IN SITU MARTENSITIC TRANSFORMATION IN A TERNARY  $MgO-Y_2O_3-ZrO_2$  ALLOY: I, TRANSFORMATION IN TETRAGONAL  $ZrO_2$  GRAINS.** The martensitic transformation in tetragonal  $ZrO_2$  grains in a ternary  $MgO-Y_2O_3-ZrO_2$  alloy has been studied using in situ observations in the transmission electron microscope. Transformation occurred by the nucleation and growth of monoclinic laths; thermoelastic equilibrium can be maintained at different extents of transformation by continuously varying the applied stress. The product phase was always twinned. (Edited author abstract). 30 Refs.

Lee, Ran-Rong (Case Western Reserve Univ, Cleveland, OH, USA); Heuer, Arthur H. *J Am Ceram Soc* v 71 n 8 Aug 1988 p 694-700.

**089496 IN SITU MARTENSITIC TRANSFORMATION IN A TERNARY  $MgO-Y_2O_3-ZrO_2$  ALLOY: II, TRANSFORMATION IN TETRAGONAL  $ZrO_2$  PRECIPITATES.** The stress-induced martensitic transformation of t- $ZrO_2$  precipitates in a ternary  $MgO-Y_2O_3-ZrO_2$  alloy has been studied in situ in the transmission electron microscope. The transformation occurs autocatalytically and takes place by piecewise growth of two twin-related m- $ZrO_2$  variants. Unloading causes retransformation of partially transformed precipitates. The martensitic transformation in this system is clearly thermoelastic. (Edited author abstract). 29 Refs.

Lee, Ran-Rong (Case Western Reserve Univ, Cleveland, OH, USA); Heuer, Arthur H. *J Am Ceram Soc* v 71 n 8 Aug 1988 p 701-706.

**089497 STRUCTURAL CHANGES BY MECHANICAL AND THERMAL STRESSES OF 2.5-MOL-%  $Y_2O_3$ -STABILIZED TETRAGONAL  $ZrO_2$  POLYCRYSTALS.** Structural changes of 2.5-mol-%  $Y_2O_3$ -stabilized tetragonal  $ZrO_2$  polycrystal fractured surfaces, as well as ground, polished, and annealed surfaces, were studied by X-ray diffraction. Much greater intensity of the (200) tetragonal peak than (002) was found on the thin surface layer of the ground specimen, but not on the fracture surface. The intensity changes were discussed in relation to the toughening mechanism. (Author abstract). 6 Refs.

**089499 STRUCTURE IN GROUND SURFACES OF  $Y_2O_3$ -DOPED TETRAGONAL ZIRCONIA POLYCRYSTALS.** The tetragonal zirconia phase showed a remarkable preferred orientation by grinding, in addition to the formation of both monoclinic and rhombohedral phases through phase transformation under stress. The preferred orientation of the tetragonal phase consisted of the plane (001) parallel to the grinding surface can be explained in terms of the ferroelastic behavior based on the switching of the crystallographic axis  $[100] \rightleftharpoons [001]$  of the tetragonal phase. By thermal annealing at temperatures up to 1073 K, both the monoclinic and rhombohedral phases disappeared. The preferred orientation of the tetragonal phase, however, has remained even after annealing at temperatures up to 1473 K. The formation of (001)  $[110]$  grinding texture specified in terms not only of the plane (001) parallel to the grinding surface but also of the direction  $[110]$  parallel to the grinding direction was revealed through the X-ray pole figure measurements. (Edited author abstract). 18 Refs. In Japanese.

**089500 HERSTELLUNG UND EIGENSCHAFTEN VON GASDRUCKGESINTERTEM ZIRKONOXID.** [Fabrication and Material Properties of Gas-Pressure Sintered Zirconia.]. Following calcination in the air, oxide materials that have been post-densified in a carbon atmosphere show a substantial loss in strength compared to non-calcined materials. If post-densification takes place in an oxygen atmosphere, this phenomenon does not take place. The paper investigates the influence of the gas atmosphere (Ar or Ar/ $O_2$ ) on the strength of TZP-ZrO<sub>2</sub> manufactured by means of gas pressure sintering. This method is compared to conventional hot densification processes (sintering, sinter/HIP, hot axial pressing). Samples manufactured by means of the gas sintering process in an Ar/ $O_2$  atmosphere show the highest strength values and very low variations. TT Fabrication and Material Properties of Gas-Pressure Sintered Zirconia. (Author abstract). In German.

**089501 STRESS-INDUCED TRANSFORMATION DURING COMPRESSION OF  $ZrO_2$ -4 mol%  $Y_2O_3$ .** In order to determine the relation between the stress-induced transformation and the mechanical behavior of PSZ more sensitively, uniaxial compression tests were employed. The stress-strain curves obtained at temperatures from 673 to 773 K are shown. The linearity in the stress-strain relation terminates at about 1.0 percent nominal strain. Over the strain, a peculiar mechanical behavior exhibiting a yield point and subsequent plastic deformation is observed in this temperature range. At temperatures other than in this range, the stress-strain curves retained their linearity up to fracture. 3 Refs.

**089502 SINTERING BEHAVIOUR OF HIGHLY AGGLOMERATED ULTRAFINE ZIRCONIA POWDERS.** The sintering behavior of highly agglomerated ultrafine zirconia powders can be described by a combination of mechanisms such as neck formation and shrinkage, fissure formation and growth, pore growth, grain growth, pore rearrangement shrinkage, and pore entrapment. There exist two optimum sintering temperatures: one is due to the competition between neck formation and shrinkage, fissure formation and pore growth; the other is due to the competition between pore shrinkage and pore entrapment, both resulting from grain growth. It is also found that an increase of green density which is caused either by a different consolidation pressure, a different preparation method, or a different calcination temperature results in a decrease of sintered bulk density. This can be explained by the state of agglomeration and the uniformity of powder packing. (Author abstract). 25 Refs.

**089503 ELECTRICAL CONDUCTIVITY OF  $(ZrO_2)_{0.85}(CeO_2)_{0.12}(Y_2O_3)_{0.03}$ .** A number of zirconia-based materials show promise as electrode materials in magneto-hydrodynamic (MHD) generators. As a part of an exploratory program to find suitable materials for graded electrode applications in MHD generators, partially stabilized and fully stabilized sintered ceramic materials were prepared and characterized. The oxygen ion transference number  $t_{ion}(O^{2-})$  and electrical conductivity were measured up to 1670 K in the oxygen partial pressure range 1 to  $10^{-6}$  atm. The activation energies for conduction were determined. The electrical properties are characterized by mixed conduction, ionic and electronic. The observed conductivity data are explained in terms of the defect equilibrium reactions between tetravalent  $Ce^{4+}$  and trivalent  $Ce^{3+}$  ions. (Edited author abstract). 17 Refs.

Patil, D.S. (BARC, Trombay, India); Venkatramani, N.; Rohatgi, V.K. *J Mater Sci* v 23 n 9 Sep 1988 p 3367-3374.

**089504 CHARACTERIZATION OF R.F.-SPUTTERED ZIRCONIA COATINGS.** R.f.-sputtered zirconia coatings with alumina and yttria were characterized by X-ray photoelectron spectroscopy, electron spin resonance and thin film X-ray diffraction. From the X-ray diffraction results, the as-deposited zirconia coatings were found to be amorphous and they remained amorphous after annealing at 1123 K for 15 min. It was deduced from the X-ray photoelectron spectroscopy results that zirconium ions in the amorphous zirconia coating possess a higher net charge than that of ions in ordinary ZrO<sub>2</sub>. Further, the formation of electron-trapped centers was indicated by the observation of an electron spin resonance absorption at  $g = 1.97$ . Crystallized zirconia coatings seem to be less resistant to corrosion than as-deposited zirconia coatings, as inferred from acoustic emission analysis. It was found that crystallization leads to a marked decrease in the loss tangent of the sputtered zirconia coating. (Author abstract) 14 refs.

Iwamoto, Nobuya (Osaka Univ, Ibaraki, Jpn); Makino, Yukio; Kamai, Masayoshi. *Thin Solid Films* v 153 Oct 26 1987, Pap Presented at the Int Conf on Metall Coat - Part I, San Diego, CA, USA, Mar 23-27 1987 p 233-242.

**089505 TOTAL ENERGY CALCULATIONS FOR  $ZrO_2$ .** Total energy calculations are presented for zirconia in its tetragonal and cubic structure. The results show that the phase transition from tetragonal to cubic is driven by the thermal motion of the oxygen atoms. The theoretical value of the cohesive energy is in good agreement with experiment. The electric field gradients are in agreement with the experimental values obtained from Perturbed Angular Correlation measurements. This indicates that the lattice distortion around the probe tantalum nucleus is small. (Author abstract) 16 refs.

**089506 STABILITY LIMITS IN THE MONOCLINIC-TETRAGONAL TRANSFORMATIONS OF ZIRCONIA.** A variety of experimental data obtained from single crystals and powders of zirconia has been examined to obtain the stability limits of the tetragonal and monoclinic phases. These limits are used to delineate the possible modes of transformation at different temperatures in the light of a nonclassical theory of nucleation. The theory predicts an asymmetric relation between three critical temperatures  $T^*$ ,  $T_0$ , and  $T_c$ . Transformation by nucleation and growth occurs only in the range  $T_0$ - $T_c$  during cooling and in the range  $T^*$ - $T_0$  during heating. Below  $T_0$ , transformation proceeds homogeneously in a manner akin to spinodal decomposition. In the neighborhood of  $T_c$ , the metastable tetragonal phase can have a long lifetime. It is assumed that the driving mechanism of transformation comes from the partial softening of a

particular shear mode of lattice vibration. An indirect evidence in support of this assumption comes from the linear relationship between the transformation temperature of a zirconia/hafnia solid solution and the reciprocal effective cation mass. (Author abstract) 31 refs.

Garvie, R.C. (CSIRO, Clayton, Aust); Chan, S.-K. *Physica B & C* v 150 n 1-2 May 1988, Proc of the Int Conf on Electr Struct and Phase Stab in Adv Ceram, Argonne, IL, USA, Aug 17-19 1987 p 203-211.

**089507 POLYMORPHIC TRANSFORMATIONS OF ZIRCONIA.** The polymorphic transformations of zirconia are elucidated as displacive transformations originating from the softening or partial softening of appropriate elastic constants. From expansions of the free energy in powers of symmetry-adapted homogeneous strains, all the possible symmetry and thermodynamically allowed transformation paths starting from the cubic and tetragonal parent phases are obtained. It is found that transformations that start from the cubic parent phase involve cubic invariants and are necessarily of a discontinuous (first order) nature because of symmetry. However, transformations that start from the tetragonal parent phase do not involve cubic invariants. They can be of a discontinuous or continuous (higher than first order) nature depending on whether the fourth order invariants are negative or positive. It is also found that the orientations of the different variants of each product phase and the stress-free coherent interfaces between them are all predetermined by the symmetry of the starting parent phase. (Author abstract) 18 refs.

Chan, S.-K. (Argonne Natl Lab, Argonne, IL, USA). *Physica B & C* v 150 n 1-2 May 1988, Proc of the Int Conf on Electr Struct and Phase Stab in Adv Ceram, Argonne, IL, USA, Aug 17-19 1987 p 212-222.

**089508 ZIRCONIA DYNAMICS STUDIED BY PAC SPECTROSCOPY.** Relaxation of  $^{181}\text{Ta}$  nuclei due to diffusion of oxygen vacancies in cubic zirconia/yttria has been measured by perturbed angular correlation spectroscopy. The activation energy of the vacancy jump rate is found in a temperature range above 750°C and is in reasonable agreement with the activation energy of ionic conduction. Preliminary results of a  $^{111}\text{In}/^{111}\text{Cd}$  perturbed angular correlation investigation of high-temperature monoclinic and tetragonal zirconia are also reported. (Author abstract) 19 refs.

Gardner, John A. (Oregon State Univ, Corvallis, OR, USA); Jaeger, H.; Su, H.T.; Warnes, W.H.; Haygarth, John C. *Physica B & C* v 150 n 1-2 May 1988, Proc of the Int Conf on Electr Struct and Phase Stab in Adv Ceram, Argonne, IL, USA, Aug 17-19 1987 p 223-229.

**089509 EXAFS STUDY OF YTTRIA STABILIZED CUBIC ZIRCONIA.** EXAFS (Extended X-ray Absorption Fine Structure) studies of cubic  $(ZrO_2)_{1-x}(Y_2O_3)_x$  are reported for the concentration range  $0.09 < x < 0.4$ . When the trivalent Y ions are substituted for the tetravalent Zr ions,  $O^{2-}$  vacancies are also introduced for charge compensation. However, the distribution of the  $O^{2-}$  vacancies in the structure is not known. In this EXAFS study, systematics of disorder and vacancy distribution on the oxygen sublattice are monitored from both the Zr and Y sites as Y, and hence  $O^{2-}$  vacancy content, is varied. It is observed that oxygen vacancies occur adjacent to both Y and Zr ions but preferentially in proximity to Zr. (Author abstract) 18 refs.

## REFRACTORY METALS

### Applications

**089510 TUNGSTEN AND OTHER REFRACTORY METALS FOR VLSI APPLICATIONS II, PROCEEDINGS OF THE 1986 WORKSHOP.** The proceed-

ings contains 46 papers. The papers are grouped under the following headings: practical and device considerations for refractory metal usage in VLSI; selective tungsten-selectivity loss and nucleation on insulators; CVD tungsten-fundamental reaction and growth studies; recent CVD process and equipment developments; blanket CVD tungsten-metal gate applications and adhesion studies; chemical vapor deposition of molybdenum from MoF<sub>6</sub>; characteristics of CVD tungsten films in device structures; properties of refractory metals deposited by sputtering or evaporation; reactive ion etching of refractory metal films; and recent new papers. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10611 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

## Corrosion Resisting

**089511 RESISTANCE A LA CORROSION DES ALLIAGES DE TITANE, DE ZIRCONIUM OU DE TANTALE DANS LES MILIEUX CHLORES OU CHLORURANTS. CARACTERES PRINCIPAUX.** [Corrosion Resistance of Titanium, Zirconium or Tantalum Alloys in Chlorinated or Chloridizing Media. Key Features]. With respect to their general corrosion resistance, the three materials titanium, zirconium and tantalum can be classed upwards in that order. However, titanium (for oxidizing environments) and zirconium (for reducing environments) are complementary, whereas zirconium alone out of the three metals is able to resist alkaline solutions. These different behaviors are illustrated schematically in a diagram in which the range of application of each material is outlined. The beneficial effects of alloying additions in the case of titanium are shown. Economically, the use of these materials in the higher price bracket is justified in aggressive environments whenever a reduction in maintenance overhead, continuous production, productivity gains through higher operating temperature or pressure, and high purity products obtained under top safety conditions are management priorities. (Edited author abstract) In French. 45 refs.

Tricot, Roland (Cie Compagnie Europeenne du Zirconium Cezus). *Mater Tech* v 75 n 7-8 Jul-Aug 1987 p 297-307.

**089512 L'UTILISATION DES ACIERS ET ALLIAGES REFRACTAIRES DANS L'INDUSTRIE PETROCHIMIQUE.** [Use of Refractory Steels and Alloys in the Petrochemical Industry]. After a brief review of some of the high-temperature corrosion problems encountered in the petrochemical industry, the various factors which determine the resistance to these types of attack are considered. The importance of establishing the real service conditions through the use of constitutive and phase stability diagrams is emphasized. These considerations are used both to interpret empirically established material selection criteria and to indicate possible paths for future alloy development. (Edited author abstract) In French. 17 refs.

## Creep

**089513 SINGLE CRYSTALS OF REFRACTORY METALS.** Molybdenum (Mo) and tungsten (W) are greatly expected as a superior heat-resistant material in the fields of energy, aerospace, intelligence and electronics allied industries. However, these materials suffer from brittleness near room temperature after recrystallization or welding. It is generally accepted that such an embrittlement is due to the existence of grain boundaries. Thereby, a single crystal would basically solve the problem concerning the intergranular brittleness. There are several methods to prepare a single crystal of refractory metal:

electron-beam floating zone method and strain-annealing method. In this work, first, essential factors for growth techniques of a large-scale single crystal of refractory metal were clarified. Secondly, the mechanical properties, particularly low-temperature ductility and creep resistance of the single crystal were characterized. 9 refs.

## Impurities

**089514 MULTIELEMENT ULTRATRACE ANALYSIS OF MOLYBDENUM WITH HIGH PERFORMANCE SECONDARY ION MASS SPECTROMETRY.** Electron beam melting has been used to obtain ultrapure refractory metals that are gaining importance in metal oxide semiconductor-very large scale integration (MOS-VLSI) processing technology, fusion reactor technology, or as superconducting materials. Although the technology of electron beam melting is well established in the field of production of very clean refractory metals, little is known about the limitations of the method because the impurity level of the final products is frequently below the detection power of common methods for trace analysis. A suitable method for quantitative multielement ultratrace bulk analysis of molybdenum with SIMS has been developed. Detection limits of the analyzed elements from 10<sup>-7</sup> g/g down to 10<sup>-12</sup> g/g have been found. Additional information about the distribution of the trace elements has been accumulated. (Edited author abstract). 17 Refs.

## Industrial Applications

**089515 REFRACTORY METALS: APPLICATIONS IN THE GLASS AND CERAMICS INDUSTRIES.** Refractory metals and, in particular, molybdenum and tungsten, are increasingly being used for the melting, homogenization, transportation and processing of glass and ceramic wool, shaped parts, tubes etc. Characteristics such as high melting point, good corrosion and creep resistance, high hot strength, good workability and machinability make these materials eminently suitable for such applications. This paper describes the refractory metal applications in glass and ceramic industries. (Edited author abstract)

## Ion Implantation

**089516 STUDY OF THE SURFACE LAYERS OF GROUP IVA METALS WITH IMPLANTED SILICON IONS.** The implantation of Si<sup>+</sup> ions with energies of 30 or 16 keV into Ti, Zr and Hf at room temperature leads to amorphization of the surface layer of the metal. During annealing at 870 K an amorphous surface layer of hafnium and titanium with implanted silicon ions, owing to a reaction with oxygen in the residual atmosphere, is converted into an amorphous solid solution of monoclinic HfO<sub>2</sub> or TiO<sub>2</sub> with Si, which prevents further oxidation of the metal. The layers of amorphous alloy are thermally stable up to 1270 K. In the case of annealing of Zr with implanted Si ions at a temperature no higher than 870 K oxidation of the surface amorphous layer in a residual oxygen atmosphere occurs, as well as crystallization of the layer to ZrO<sub>2</sub>. Analogous phenomena are observed in the case of hafnium, into which oxygen ions or a small dose of silicon ions are implanted. 9 refs. In Russian.

## Reviews

**089517 RECENT ADVANCES IN AEROSPACE REFRACTORY METAL ALLOYS.** Refractory metals are prime candidates for many high temperature aerospace components because of their high melting points and inherent creep resistance. The use of refractory metals is often limited, however, by poor room temperature properties, inadequate oxidation resistance at elevated temperatures, or difficulties associated with joining or welding. Recent advances in the understanding of the role of oxygen in room temperature brittle behaviour problems, especially in molybdenum alloys, are described. The oxidation behaviour of refractory alloys at elevated temperatures in complex environments has also been re-evaluated and a clear understanding of the appropriate environments requiring protective coatings has emerged. Current research is emphasising the development of creep resistance of refractory alloys that are inherently oxidation resistant. The long term creep resistance of refractory alloys has been the subject of research for space nuclear applications and progress in this area is discussed. The effectiveness of carbides in molybdenum and tungsten alloys designed for high temperature creep resistance has been reanalysed. The origins of brittle behaviour in welded alloys are described. Examples are also given of novel solid state joining developments in tungsten and molybdenum alloys below and above their recrystallisation temperatures. Novel developments are underway in particulate refractory metals, specifically encompassing rapid solidification processing. (Edited author abstract). 115 Refs.

## Testing

**089518 EFFECT OF TEST TEMPERATURE ON TENSILE AND FATIGUE PROPERTIES OF NICKEL-BASE HEAT-RESISTANT ALLOYS.** A series of tensile and strain controlled low-cycle fatigue tests were conducted at temperatures ranging from RT to 900°C on a nickel-base heat-resistant alloy, Hastelloy XR-II, which is one of the candidate alloys for applications in the process heating high-temperature gas-cooled reactor (HTGR). Fatigue tests at room temperature and all tensile tests were conducted in air, while fatigue tests at and above 400°C were conducted in the simulated HTGR helium environment. In those tests the effect of test temperature on tensile and fatigue properties was investigated. (Edited author abstract) 15 refs.

**089519 CRITICAL POINT DATA OF REFRACTORY METALS, ALUMINUM OXIDE AND URANIUM DIOXIDE USING THE HOCH-ARPSHOFFEN METHOD.** The Hoch-Arpschoffen method was used to determine the critical constants of titanium, molybdenum, aluminum oxide and uranium dioxide. In this method, the density of the liquid as a function of the temperature (but not necessarily close to the critical temperature) is required to obtain the critical temperature T<sub>c</sub> and the critical density d<sub>c</sub>. The density of liquid UO<sub>2</sub>, coexisting with gas, was calculated between the melting point and the critical point. (Edited author abstract) 20 refs.

### Transport Properties

**089520 TRANSPORT IN REFRACTORY METALS AND THEIR INTERACTION WITH  $\text{SiO}_2$ : COMPARISON OF TUNGSTEN AND MOLYBDENUM.** We have investigated sputtered and electron-beam-evaporated thin films of tungsten and molybdenum deposited onto  $100 \text{ Å}$   $\text{SiO}_2$ . These two refractory metals have comparable room temperature resistivities ( $5\text{--}6 \mu\Omega/\text{m}$ ) and a work function at the midgap between  $n^+$  and  $p^+$  polycrystalline silicon. Therefore both can be considered for application as a gate electrode in submicron very large scale integration technology. We have probed their interaction with  $\text{SiO}_2$  using Auger spectroscopy, cross-sectional transmission electron microscopy (CTEM) and with current-voltage (I-V) characteristics of molybdenum and tungsten metal/oxide/semiconductor (MOS) capacitors as a function of the annealing temperature. We have also measured electrical resistivity in the  $4\text{--}300 \text{ K}$  temperature range to ascertain the differences and the similarities between the two. We find that, in terms of resistivity, the difference between the two metals is slight. (Edited author abstract) 16 refs.

### Applications

**089523 UTILISATION DE NOUVEAUX REFRIGERANTS POUR LES POMPES A CHALEUR A HAUTE TEMPERATURE.** [Using New Refrigerants for High Temperature Heat Pumps]. This paper presents experimental results obtained with high temperature heat pumps working with new refrigerants: a pure fluid R142b

and non-azeotropic mixtures of R12 and R114, all these fluids being CFC's. Results are good as far as for R142b experimental results are in good relation with theory and permit to hope for the production of energy at  $95^\circ\text{C}$  in good conditions and for non-azeotropic mixtures, our tests can explain the behavior of these mixture when leakages appear on heat pumps. In French.

Blaise, Jean-Claude (Electricite de France, Fr); Dutto, Thierry. *RGE Rev Gen Electr* n 10 Nov 1987 p 15-19.

### Components

**089524 SOLUBILITY OF REFRIGERATION OIL IN R-22 REFRIGERANT.** This work investigates the influence of distillation range and hydrocarbon composition of oils on their solubility in R-22 refrigerant. The mutual solubilities were determined on measured quantities of oil and refrigerant in a glass ampule with a magnetic stirrer, the ampule being either sealed or closed with a plug. For the investigation of the influence of the hydrocarbon composition of refrigeration oil on its mutual solubility with R-22 coolant, the experimental oil KhM-35 was subjected to adsorptive separation on silica gel, segregating the paraffinic-naphthenic and aromatic hydrocarbons. It is shown that the naphthenic-paraffinic hydrocarbons have the poorest solubility, the aromatic hydrocarbons the best solubility. The oil solubility improves with increasing content of aromatic hydrocarbons in the blend.

### Composition Effects

**089525 CHOICE OF WORKING FLUIDS FOR NON-AZEOTROPIC MIXED-REFRIGERANTS AIR CONDITIONING SYSTEMS.** Non-azeotropic mixed-refrigerants air conditioning is a potential energy saving process of removing heat from a space. Desirable non-azeotropic mixed refrigerants should possess physical, thermodynamic, and chemical properties which permit their efficient operation in air conditioning systems. In addition to economical considerations, there should be no danger to health in case of their escape due to leaks or other causes in an air conditioning system. These physical, thermodynamic, chemical, economical, safety and specific properties are listed and discussed briefly in this paper. (Author abstract) 6 refs.

Wu, Chih (US Naval Acad, Annapolis, MD, USA). *Energy Convers Manage* v 27 n 4 1987 p 385-387.

### Condensation See Also VAPORS—Condensation.

**089526 CONDENSATION OF REFRIGERANT MIXTURES R22 + R114 INSIDE A HORIZONTAL TUBE.** Experimental study of the condensation of pure and mixed refrigerants of R22 and R114 inside a spirally grooved horizontal tube is carried out for a tube-in-tube counter flow type condenser in the ranges of  $3\text{--}21$  bar of pressure and  $26\text{--}70 \text{ kg/h}$  of mass flow rate. Axial distributions of refrigerant, tube wall and cooling water temperatures, wall heat flux and vapor quality are graphically shown and circumferential distribution of tube wall temperature is also shown. The characteristic of the local Nusselt number depends on the molar fraction, while the average Nusselt number can be correlated well by an equation, which is modified from a previously established equation for pure refrigerants inside a smooth tube. (Author abstract). 19 Refs. In Japanese.

Koyama, Shigeru; Fujii, Tetsu; Miyara, Akio; Takamatsu, Hiroshi; Yonemoto, Kazuo. *Nippon Kikai Gakkai Ronbunshu B Hen* v 54 n 502 Jun 1988 p 1447-1452.

### Energy Conservation

**089527 LE FROID DANS LES SURFACES COMMERCIALES - 2. LES ECONOMIES.** [Cooling of Commercial Surfaces - 2. Savings]. Reduction of energy

costs of a refrigerating unit with a large surface is not a priority task of refrigeration equipment users. Energy costs amount to only  $0.1\text{--}0.4\%$  of the total budget of a supermarket. Nevertheless, considerable savings can often be made. The second part of this investigation discusses the possibilities of reducing consumption costs. The measures that can be implemented to improve the cooling installation are specified, namely: improvement of the final utilization of the cold; improvement of the production and distribution of the cold; recuperation of the heat energy; measures and tests implemented on 2 units of equipment; a freezer and a vertical cabinet. In French.

### Evaluation

**089528 THERMODYNAMISCHER VERGLEICH VON KAEITEMITTELN FUER DEN EINSATZ IN WAERMEPUMPEN UND KAEITEMASCHINEN, EINFLUSS DER UNTERKUEHLUNG UND ANSAUGUEBERHITZUNG.** [Thermodynamic Comparison of Refrigerants for Use in Heat Pumps and Refrigerating Machines]. The theoretical cold-vapor machine operation is used as a theoretical reference process of single-stage cold-vapor compression refrigerating machines and heat pumps. Its ratings are smaller than in the Carnot process in conformity with quality levels 'K' and 'H' for refrigerating or heating pump operation. For refrigerants R 13B1, R 602, R 22,  $\text{NH}_3$ , R 12, R 114, R 11 and R 113, these quality levels and the effect of subcooling and suction overheat of refrigerants on the ratings and volumetric refrigerating and heating capacities of the theoretical cold-vapor machine operation are determined and presented for comparisons. Hints at the application of parameters to the real process complete the statements. (Edited author abstract) 7 refs. In German.

Lehnguth, M. (Technische Univ Karl-Marx-Stadt, East Ger). *Luft Kaelte tech* v 23 n 3 1987 p 144-148.

**089529 DES FLUIDES REFRIGERANTS MOINS POLLUANTS: COMMENT? QUAND? [Less Polluting Cooling Fluids: How and When?]** This current report presents the possible solutions in the face of possible governmental regulations on the use of CFC's in the air conditioning and refrigeration industry because of their potential for exhaustion of the ozone layer. The wide range of applications for small quantities of CFC's renders problematical their replacement by other fluids. However, the possibility of mixing the known fluids could result in the identification of fluids possessing the thermodynamic qualities sought and respecting environmental balance. (Author abstract) In French. 9 refs.

### Flow

**089530 NUCLEATE AND CONVECTIVE BOILING OF REFRIGERANTS IN CHANNELS WITH NATURAL CIRCULATION.** Despite the considerable number (up to 6-8 according to different classifications) of two-phase flow regimes with developed boiling in tubes there are apparently only two main regimes of precritical heat transfer, i.e. nucleate and convective. This point of view is conclusively confirmed when studying boiling of refrigerants in the case of forced motion in a channel and at the present time, while it is not generally acknowledged, it is at least the most extensive. Realization of convective boiling with natural circulation is of course possible only in sufficiently long channels. The authors demonstrate that with boiling of refrigerants in channels with natural circulation, as with forced motion, together with nucleate boiling it is possible for a convective boiling regime to exist. 8 refs.

**089532 THERMODYNAMIC STATE SURFACE AND CYCLE ANALYSIS FOR REFRIGERANT 114.** An equation of state for Refrigerant 114 ( $\text{CClF}_2$ ,  $\text{CClF}_2$ ) was formulated based on available PVT measurements, taking the thermodynamic consistency into consideration. The developed equation of state is expressed by the reduced Helmholtz function as a function of reduced temperature and reduced density. Derived isochoric specific heat capacity, isobaric specific heat capacity, speed of sound and vapor pressure were critically examined. The developed equation is effective for a range of temperatures 200 to 550 K and of pressures up to 20 MPa, which corresponds to the density range up to  $1750 \text{ kg/m}^3$ . With the aid of the proposed equation, the cycle analysis for the heat pump, refrigeration and Rankine cycle was carried out, and it became clear that Refrigerant 114 is a suitable working fluid especially for high-temperature heat pump systems. ## Performance

**089533 METHODS FOR COMPARING THE PERFORMANCE OF PURE AND MIXED REFRIGERANTS IN THE VAPOUR COMPRESSION CYCLE.** Methods of comparing pure and mixed refrigerants are considered by computing the coefficient of performance and the heating capacity for an ideal vapour compression cycle for R22/R114 and R22/R11 mixtures. For comparisons based only on one characteristic condensation temperature and one evaporation temperature, the results depend entirely on how the characteristic temperatures are defined. A method specifying the heat transfer fluid temperatures and a total heat exchanger area per unit capacity is thought to offer a comparison applicable to both pure and mixed refrigerants. Using this method, the effects of compressor superheat, heat exchanger approach temperatures, and the match of refrigerant and heat transfer fluid temperatures are discussed. (Author abstract) 21 refs.

## Phase Equilibria

**089534 MEASUREMENTS OF PVT<sub>x</sub> PROPERTIES FOR THE R 13B1+R 114 SYSTEM.** The PVT<sub>x</sub> properties for the R 13B1+R 114 system have been measured by the constant-volume method coupled with several isothermal expansion procedures. The results for four different compositions of 25, 50, 70, and 80 wt% R 13B1 cover the range of temperatures 303-443 K and the range of pressure 0.5-10.3 MPa, which corresponds to the density variation from 150 to  $1200 \text{ kg/m}^3$ . The experimental uncertainties of the temperature, pressure, density, and

mass fraction measurements were estimated to be no greater than 8 mK, 2.0 kPa, 0.15%, and 0.12%, respectively. The dew and bubble points were determined. (Author abstract) 7 refs.

Hosotani, Shiro (Keio Univ, Yokohama, Jpn); Maezawa, Yukishige; Uematsu, Masahiko; Watanabe, Koichi. *J Chem Eng Data* v 33 n 1 Jan 1988 p 20-23.

**089535 MEASUREMENTS OF THE VAPOR-LIQUID COEXISTENCE CURVE FOR THE R 13B1+R 114 SYSTEM IN THE CRITICAL REGION.** Measurements of the vapor-liquid coexistence curve in the critical region for the refrigerant mixture of bromotrifluoromethane ( $\text{CBrF}_3$ , R 13B1) and 1,2-dichloro-1,1,2,2-tetrafluoroethane ( $\text{CClF}_2\text{CClF}_2$ , R 114) were made by visual observation of the disappearance of the meniscus at the vapor-liquid interface within an optical cell. Eighteen saturated-vapor densities and 21 saturated-liquid densities for four different compositions of 25, 50, 70, and 80 wt% R 13B1 between 345 and 406 K were obtained in the range of densities  $356\text{-}1166 \text{ kg/m}^3$ . The experimental error of temperature, density, and mass fraction was estimated within  $\pm 15 \text{ mK}$ ,  $\pm 0.5\%$ , and  $\pm 0.05\%$ , respectively. On the basis of these measurements, the critical curve of the R 13B1+R 114 system is determined and compared with several predictive methods. In addition, new correlation so as to represent the composition dependence of the critical parameters for the R 13B1+R 114 system is proposed. (Author abstract) 19 refs.

## Phase Transitions

**089536 NUCLEATE POOL BOILING OF REFRIGERANT/OIL MIXTURES.** Experimental data are presented for the boiling of Refrigerant-113 and of mixtures of Refrigerant-113 and an oil (Shell Clavus-68) from horizontal electrically heated tubes. Pure-refrigerant boiling data for the finned tube showed that the effect of finning decreased considerably as the heat flux was increased and that the heat flux for a given temperature difference could actually be lower with the fin tube than the plain tube for large heat fluxes. The effect of oil was to decrease the heat transfer coefficient by an amount greater than expected on the basis of its mole fraction. The presence of the oil induced a complex variation of heat transfer coefficient around the surface of the tube. (Edited author abstract) 13 refs.

## Selection

**089537 QUEST FOR ALTERNATIVES.** In the search for alternatives to the fully halogenated CFC (chlorofluorocarbon) refrigerants there are not a limitless number of compounds from which to choose. Rather, it has been demonstrated by both theoretical and empirical reasoning that this same class of compounds - the chlorofluorocarbons - remains the clear choice by virtue of their stability, excellent thermodynamic and health and safety characteristics, and familiarity to both manufacturers and users. However, some of the previously acceptable CFC compounds are no longer acceptable because of environmental considerations. By approaching the problem from the molecular structure, the properties of the various CFC compounds could be treated in a systematic way. This approach revealed a range of CFC compounds that should be environmentally acceptable as well as retaining the other attributes of the fully halogenated CFC refrigerants. The initial research efforts should be directed towards CFC compounds from this region of mixtures where the major component is from this region. 13 refs.

## Surface Tension

**089538 MEASUREMENTS OF THE SURFACE TENSION OF THREE REFRIGERANTS, R 22, R 115, AND R 502.** The surface tension was measured on three fluorocarbon refrigerants, R 22 (chlorodifluoromethane,  $\text{CHClF}_2$ ), R 115 (chloropentafluoroethane,  $\text{CClF}_2\text{CF}_3$ ), and R 502 (azeotropic mixture of 48.9 wt percent R 22 and 51.1 wt percent R 115), by using the capillary rise method. The results cover the range of temperatures from 273 K to a temperature close to the critical point of each substance. The uncertainty of surface tension measurements was estimated to be less than  $\pm 0.16 \text{ mN/m}$ . For R 115 and R 502, van der Waals type correlations were developed based on the present results. (Author abstract) 22 refs.

## Thermodynamic Properties

**089539 ENTROPY-VOLUME PLANE: A NEW APPROACH TO ON-LINE CALCULATION OF REFRIGERANT PROPERTIES.** Implementation of new techniques for real-time control and failure detection of HVAC & R equipment requires fast and accurate methods for on-line calculation of the thermodynamic properties of refrigerants. This paper presents a new approach to such on-line property calculations using a technique evolved from a new specific entropy-specific volume plane. The special feature of constant temperature lines in this entropy-volume plane provides the basis for the proposed fast, simple and accurate method. The results of a case study on R12 are presented with an accuracy in temperature calculations of within  $0.5^\circ\text{C}$  and higher. (Author abstract) 18 refs.

## Thermodynamics

**089541 POTENTIAL NAVAL SHIPBOARD APPLICATION OF NONAZEOTROPIC ENERGY CONVERSION.** The thermodynamic performance of an energy conversion device may be improved potentially by using a nonazeotropic mixture in a vapor cycle. A nonazeotropic mixture has a temperature distribution parallel to that of the surrounding fluid with which heat transfer takes place during the evaporation and condensation processes. Interest has increased in recent years in the use of nonazeotropic refrigerant mixtures to improve the performance of energy conversion devices. This report surveys developments in nonazeotropic energy conversion, describes the theory of a nonazeotropic energy conversion cycle, predicts energy savings possible from use of nonazeotropic energy conversion devices, and discusses potential naval shipboard application of such an energy conversion cycle. (Author abstract) 35 refs.

**089542 GENERAL METHOD FOR THE THERMODYNAMIC EVALUATION OF HEAT PUMP WORKING FLUIDS.** Worldwide experience with Rankine cycle prime movers demonstrates that organic fluids have the potential of meeting future needs of high temperature heat pumps. Many promising candidate fluids exhibit a complex molecular structure, which imparts a peculiar character to the thermodynamics of the heat pump cycle. Since reliable tables of thermodynamic properties are unavailable for most of the fluids of potential interest, a general method was worked out which requires a small amount of data to evaluate the energy performance of different fluid classes. Cycle quality, defined as the ratio of actual to ideal COP\*, is recognized to be a function of the following main parameters: complexity of the fluid molecular structure, reduced temperature at which evaporation is performed; fractional temperature lift,  $\Delta T/T_c$ . For fluids having rather complex molecules both technical feasibility (owing to condensation during compression) and energy performance are unsatisfactory unless regenerative precooling of the liquid prior to expansion is applied. **089544 ABWAERMEBETRIEBENE ABSORPTIONSKAELTEANLAGE IN DER KARTOFFELVERWERTUNG HOLLABRUNN.** [Absorption Type Refrigerating System using Waste Heat at Hollabrunn Potato Processing Plant]. The use of industrial waste heat reduces primary energy consumption and, in consequence, lowers the air pollution level. Process heat recovery and process water heating with waste heat are common practice today. In view of the high cost of refrigeration, cold generation using waste heat is particularly attractive for production processes and deep-freeze storage halls. The pilot system installed at the Hollabrunn potato processing plant shows that absorption-type refrigerating systems can compete with the commercial compression-type refrigerating systems, both with regard to their control characteristics and to their investment cost. **089546 SIMULATION STUDIES OF THE BEHAVIOUR OF A HEAT PIPE-ASSISTED SOLAR ABSORPTION REFRIGERATOR.** Simulation work on an intermittent-duty, heat pipe-assisted, solar-operated aqua-ammonia absorption refrigerator is reported. The low-thermal mass collector is the integral evaporator of an acetone-copper heat pipe which delivers the collected energy isothermally to a distant generator. The shell-and-tube type generator receives the energy by vapour condensation. The condenser is air cooled. A separate R-22/steel heat-pipe system serves to cool the absorber tanks via a radiation/convection panel. Heat and mass balances are outlined on several units. The resulting equations are solved for day and night operation. It is concluded that both the initial solution (absorbent) concentration and the absorber temperature must be kept low for adequate ice production. (Author abstract) 11 refs.

**089548 MOUNTING INSTRUCTIONS FOR INSTALLATION OF PARALLEL COMPRESSORS.** Parallel compressors are a solution to the problem of balancing variable refrigeration loads. Maneurop compressors, version ER, are made for this application and are supplied with an oil sight glass and oil equalization connection. The equalization fitting is located above the oil level which ensures a connection without oil loss and preserves the gas pressure equalization. In order to ensure in all cases a good oil return, it is preferable to limit the installation of parallel compressor to three.

**089551 COMPACT ROTARY COMPRESSORS FOR REFRIGERATORS AND DEHUMIDIFIERS.** The newly developed rotary compressors for refrigerators are 25% lighter, 65% smaller in space-occupancy volume and 13% higher in EER (energy efficiency ratio) than conventional reciprocating compressors and have a higher energy and space saving ability. While the newly developed rotary compressors for handy-type dehumidifiers, are 50% lighter, 70% smaller and 28% higher in EER than conventional reciprocating compressors. (Author abstract)

Sekigami, Kazuo (Hitachi Ltd, Jpn); Tagawa, Shigetaro; Takebayashi, Masahiro. *Hitachi Rev* v 36 n 3 Jun 1987 p 169-176.

**089552 INCREASING THE ENERGY EFFICIENCY OF CENTRIFUGAL COMPRESSORS FOR REFRIGERATING MACHINES.** A calculation was performed for single-stage and double-stage compressors by changing  $\epsilon/\epsilon_{\text{nom}}$  and for a few values of the variation in efficiency when one operates under nominal  $\Delta\eta_{\text{ad}}$  conditions. The results of the calculation show that, for the example cited, a double-stage compressor in continuous operation under nominal conditions ( $Q_{\text{OAV}}/Q_{\text{OAVnom}} = 1$ ) is 7% more economical than the single-stage one. The smaller the  $Q_{\text{OAV}}$ , the smaller the advantage and, if  $Q_{\text{OAV}}/Q_{\text{OAVnom}} < 0.7$ , it is more advantageous to use a single-stage compressor. When the  $\Delta\eta_{\text{ad}}$  drops, the single-stage compressor asserts its superiority at the higher  $Q_{\text{OAV}}/Q_{\text{OAVnom}}$  values. From the analysis carried out one reaches the conclusion, viz., given the operating efficiency now attained by the stages at high  $M_1$  numbers, in conditioning systems it is advisable to use double-stage compressors. The author also considers the effects on efficiency and  $M_1$  numbers of the dimensions of impellers of single-stage compressors manufactured for conditioning systems. 4 refs.

**089553 MATHEMATICAL MODELS FOR OPTIMIZATION OF THE CENTRIFUGAL STAGE OF A REFRIGERATING COMPRESSOR.** A general approach to creating mathematical models of energy and head losses in the flow part of the centrifugal compressor has been evolved. The specific form of the mathematical model depends on the problems to be solved by it. The mathematical model of the pressure head and efficiency of a two-section stage is meant for determining its characteristics and for optimizing by variance calculations. It permits one, for instance, to determine the characteristics of the stage in a wide range of  $M_0$  variation (up to 1.4), to select the optimum profile (shape) of the impeller and the diffuser in the meridian plane, and to determine the optimum entrance angle of the vane grid of the combined diffuser (CD) which ensures coordinated operation of the CD. 3 refs.

**089555 ERMITTLUNG DER BETRIEBSZUVERLAESSIGKEIT VON KAEITEMITTELVERDICHTERN IM SCHIFFSEINSATZ.** [Determining the Dependability of Marine Refrigerant Compressors]. On 18 ships of Deutfracht-Seereederei (DSR) Rostock, studies were undertaken of the operational behaviour of refrigerant compressors in cargo hold, food supply and air-conditioning plants. The calculation of dependability parameters was made in conformity with a computer program developed by Technische Universitaet Magdeburg in which the total compressor running time can be considered. (Author abstract) 4 refs. In German.

Loechel, E. (VEB, East Ger). *Luft Kaelte tech* v 24 n 1 1987 p 38-40.

**089556 COMPRESSORS: AN APPRAISAL.** Refrigeration is the process of removing heat. We generally take this to mean the removal of heat at temperatures below ambient. The purpose may be to cool something down or to keep it cool and, at one time, the only application was in the preservation of food and drink. The compressor used for this purpose is a mechanical device, hence mechanical refrigeration systems. This is the basis of the vapor compression cycle. Following early work and the first practical circuits, the vast majority of refrigeration systems have worked on the principle of vapor compression, and it is most unlikely that this will ever be displaced from its dominant position. Author evaluates the wide range of compressors on the market beginning with a look at piston types. Development of vapor compression cycle and refrigerants are also discussed. (Edited author abstract)

## Computer Aided Design

**089558 SOFTWARE REFRIGERATION PLANT DESIGN.** The increased use of computers by refrigeration engineers has contributed to more effective work practices. Suppliers of refrigeration equipment, system designers, and those operating refrigeration systems are all interested in the application of computers to optimize plant performance, and to improve accuracy in design. Many companies have, or will write their own programs with specific features, but there is also a place for general packages. General packages will be in the form of technical design aids rather than incorporating optimization routines. This is because optimization means different things to different people, thus making development of a generally applicable optimization routine almost impossible. This paper discusses desirable features in refrigeration design computer software and how these can be incorporated in programs. Examples using a commercially available package 'RADS' are given. 3 refs.

**089559 EVAPORATIVE COOLING ON CONDENSER COILS.** Rejection of heat from refrigeration plant can be accomplished in a number of ways, once-through water, cooling towers with heat exchangers or direct air cooling. All of these have advantages and disadvantages but for direct cooling of condenser coils there is another option, the evaporative condenser. An evaporative condenser is the combination of a cooling tower with a shell and tube condenser with the circuit reduced to a single item of equipment. The extra heat transfer step of condenser water in the cooling tower/condenser combination is eliminated and hence the unit permit a reduction of the condensing temperature/pressure and so a reduction in the absorbed power of the compressor.

**Control** See REFRIGERATION—Industrial.

## Design

**089561 HIGHER FLOW TEMPERATURE FOR FINER CHILLER CONTROL.** Britain's variable climate makes control of chillers much more difficult than in foreign parts. The swings in temperature and load follow no regular seasonal patterns, so more complicated modulation problems arise. For this reason this study recommends using the slightly higher than usual flow temperature of 7°C unless the more conventional 5.5°C is important to maintain (in dewpoint plants). Raising the flow water temperature gives more control flexibility albeit at the expense of larger cooling coils, pipework and related equipment.

**089563 QUESTION OF PRESSURE.** Putting in three units to do the work of one wasn't all plain sailing; but an adjustment put the job to rights. Following repeated failures, it was agreed that an old 9 kW open air cooled unit for a walk-in dairy produce cold room just had to go! Inside the room, suspended from the ceiling, were three forced draught evaporators, each with four fans, one blower at each end with the third one at the center of a long wall, towards the end of which was a large door capable of accepting a fork lift truck. On the opposite long wall was a further door leading to the packing room so the fork lift could enter, load up then pass straight through as required.

**089565 USING HOT-GAS SPRAYED ALUMINUM COATINGS FOR EVAPORATORS OF REFRIGERATING MACHINES.** Tests were conducted on coatings produced at various air pressures and stable process parameters. The main parameters of the spraying process (distance, travel speed of the metal spraying gun, wire feed rate, arc voltage) were selected on the basis of the requirement to stabilize the spraying process and produce coatings of the required thickness. The investigation showed that the intensity of heat exchange in boiling of R-22 refrigerant on the steel surface with aluminum CPCs is high. After appropriate pilot-plant verification of the results, the hot-gas sprayed aluminum coatings can be recommended for the manufacture of heat exchanging surfaces of the freon evaporators. 10 refs.

**089567 STUDY ON FLOW IN HORIZONTAL AGITATED THIN-FILM EVAPORATORS (1ST REPORT, LIQUID-FILLET IN STEADY TWO-DIMENSIONAL FLOW).** A liquid-fillet is formed in front of the rotor blades in thin-film evaporators. The shape of the fillet varies along the axis so that an axial flow is induced in the fillet. Furthermore, the shape of the fillet varies periodically as the blades rotate due to the circumferential variation of the gravitational effect. However, these secondary effects are disregarded and steady two-dimensional flow in the circumferential direction is theoretically examined. The influences of viscosity and the amount of fluid in the casing as well as the tip clearance effect of

blades on the thickness of the liquid-fillet are predicted, and good agreement with experimental data is demonstrated. The secondary effects disregarded in the present analysis will be presented in following papers. (Author abstract) 3 refs. In Japanese.

**089568 ENHANCED HEAT TRANSFER TUBES FOR THE EVAPORATOR OF REFRIGERATING MACHINES (2ND REPORT, OPTIMIZED COMBINATION OF SHELL-SIDE AND TUBE-SIDE ENHANCEMENTS).** The tubes in this study have internal ribs and porous structures to enhance boiling of refrigerants on external surface. The ribs are provided by the application of a roller on the external surface, so that a part of the external surface is recessed with a certain pitch. Consequently, the tube-side enhancement reduces the enhanced area on the shell-side surface due to the inability to machine the porous structure on the recesses. Based on the experimental data, an analysis is performed so as to find the optimum pitch for the provision of internal ribs, where the enhancements on the tube-side and the shell-side are best utilized. (Author abstract) In Japanese. 8 refs.

**089569 ENHANCED HEAT TRANSFER TUBES FOR THE EVAPORATOR OF REFRIGERATING MACHINES (3RD REPORT, EVAPORATIVE HEAT TRANSFER FROM HORIZONTAL TUBES IN THIN FILM FLOW).** On heated horizontal tubes having the porous surface, a falling film of R-11 was evaporated at atmospheric pressure. The heat transfer coefficient of liquid film evaporation is higher than that of pool boiling when the wall superheat is small; however, the enhancement ratio reduces on the surface structure where the pool boiling heat transfer coefficient is already high. The appearance of dry spots on the porous surface was observed only at a small flow rate close to the threshold value for complete dry-out. Another advantage brought by the porous surface is the virtual elimination of hysteresis phenomena. (Edited author abstract) In Japanese. 9 refs.

**089571 MONITORING FROST GROWTH IN EVAPORATORS IS A COMPLEX PROCESS.** The calculation method used in this work is based on correlations for the airflow pressure drop, the heat transmission and the frost growth rate. The last of these factors is the most important. For this reason a vast theoretical and experimental work has been done in order to find a good way to calculate the frost growth rate. Frost deposits formed in an evaporator decrease its capacity as a result of increased heat resistance, decreased airflow and decreased evaporation temperature. Because so many variables need to be considered, a calculation of a frost-forming process is necessarily complex. A computer program exists that calculates the cooling capacity after a certain

time of frost growth. However, for the most common applications a calculation can be made by the help of a few nomograms. 5 refs.

## Heat Exchangers

**089574 OVERALL EFFICIENCIES OF LOW-GRADE ENERGY RANKINE-CYCLE ENGINES AS FUNCTIONS OF THEIR PERFORMANCE FACTORS.** To maximize these efficiencies some performance factors (such as evaporator and condenser saturation temperatures, the isentropic efficiency of the expander, the magnitude of the superheat and the working fluid and Rankine-cycle engine type) affecting the overall efficiencies of Rankine-cycle engines, using refrigerants 113 and 114 as working fluids, are studied. The analysis of the calculations shows that the overall efficiencies of Rankine-cycle engines can be increased with the increase of the saturation temperature of the evaporator and the isentropic efficiency of the expander, the reduction of the saturation temperature of the condenser, using refrigerant 113 as working fluid in the cycle instead of R-114. ## Management

**089578 OPTIMUM COGENERATION STRATEGIES FOR A REFRIGERATION PLANT.** The operation of an idealized industrial refrigeration plant having cogeneration capacity is analyzed using the linear programming model ELMO. The optimum operating strategies for the chilling sets and the steam turbine are determined for a simple time-of-use electricity tariff and for various refrigeration loads. The refrigeration load required for a manufacturing process, along with steam and electricity loads, can be met by a combination of electric and steam-driven centrifugal chillers and an absorption refrigerator operating on low pressure steam. A pass-out turbo-alternator can generate some of the plant electricity needs using high pressure steam from a gas boiler. The marginal production cost of chilled water varies considerably as the load increases, reflecting a varying minimum cost operating strategy for the different chillers. (Author abstract) 12 refs.

## Mathematical Models

**089579 MODELISATION D'UN SYSTEME DE REFRIGERATION SOLAIRE ASSOCIANT CAPTEURS SOLAIRES A EVAPORATION DIRECTE ET MOTOCOMPRESSEUR.** [Modeling a Solar Refrigeration System Including Solar Collectors for Direct Evaporation and Motor Compressor]. The solar system investigated works with only one fluid for the collection, driving and the refrigeration cycles, owing to the fact that the working fluid partially vaporizes inside the collectors. In order to feed the motor with only vapor, a vapor separator is placed between the driving loop and the collection loop, in which the fluid flows by gravity. Modeling the behavior of each component of the system provides the basis of a global model for the motor-compressor unit performances, like the temperature level and the fluid flowrates in the collector as a function of parameters such as the collection loop dimensions, the volumetric ratio of the motor and compressor, the shape of the motor cycle, the ambient temperature and the solar irradiation variations. Absorption

**089583** ANALYSIS OF A PRESSURE DRIVEN ABSORPTION REFRIGERATION CYCLE. This study presents an analysis of a pressure driven absorption refrigeration cycle which utilizes a membrane separation process to achieve refrigerant-absorbent (R/A) separation. Since the performance of such membranes cannot be

predicted generally, the analysis is accomplished by computing cycle performance as a function of the effectiveness of the membrane separation process. The net refrigeration effect and work input are determined based on thermodynamic property data for several working fluid combinations, and desirable characteristics for refrigerant-absorbent pairs are identified. The solubility parameter is used to characterize the potential for separation by candidate membrane materials. The absorbent tetraethylene glycol dimethyl ether (E-181) is found to have good potential for separation from Refrigerants 21 and 22 by typical membranes such as cellulose acetate. Additional aspects of the subject are discussed. (Edited author abstract) 5 refs.

Defrosting

**089584** ADAPTIVE DEFROST. The adaptive defrost concept operates on demand, initiating a defrost cycle only when needed, thereby saving energy and yet maintaining refrigeration system efficiency. This is accomplished by automatically adjusting the frost accumulation period to achieve an optimal predetermined defrost time. The optimal defrost time is previously determined for the particular refrigeration system and programmed into the control. The next frost accumulation time period is made a function of the optimal defrost time, the previous frost accumulation time, and the previous actual defrost time. The system thus operates according to the following relationships:  $T_a = (a - 1) + K(D_o - D_a)$ , where  $T_a$  = length of the next frost accumulation period;  $T(a - 1)$  = length of the last frost accumulation period;  $D_o$  = optimal defrost time;  $D_a$  = length of the actual defrost time; and  $K$  = system constant that determines the multiple by which the frost accumulation period will change for each increment of error in the defrost time.

Design See Also FOOD PRODUCTS PLANTS—Expansion.

**089585** VARIOUS FLOW RATES IN CONDENSER WATER CYCLE. The flow rate for the condenser water cycle is usually taken at some arbitrary value for design purposes. Most frequently with mechanical refrigeration, a rate of 3 gpm/ton is used. How would the system be affected if we were to change the design flow rate? If we look at the refrigeration machine only, we see that higher condenser flow rates will result in lower energy consumption at the compressor motor. However, as we increase the flow rates, condenser water pump horsepower increases proportionately, pipe size increases, and cooling tower size increases. The original purpose for this investigation was to find the point where the total energy consumption was least. What we found was that, over a practical range of flow rates, the total energy consumption was about the same. The unexpected finding was that the combined cost of chiller, piping and cooling tower is least at the lowest flow rates. The evaluation is made for two sizes of refrigeration machines. A 60-ton reciprocating system is evaluated over the range of 2 gpm/ton up to 6 gpm/ton. A 300-ton centrifugal system is evaluated over the range of 1.5 to 3 gpm/ton.

Waller, Bertram. *ASHRAE J* v 30 n 1 Jan 1988 p 30-32.

Efficiency

**089586** HOW ADAPTIVE DEFROST MAINTAINS REFRIGERATION SYSTEM EFFICIENCY. The adaptive defrost concept provides a demand defrost system which initiates a defrost cycle only when needed, thus saving energy by eliminating unnecessary defrosts yet maintaining refrigeration system efficiency. This is accomplished by automatically adjusting the frost accumulation period to achieve an optimal predetermined defrost time.

The optimal defrost time is previously determined for the particular refrigeration system and programmed into the control. The next frost accumulation time period is made a function of the optimal defrost time, the previous frost accumulation time, and the previous actual defrost time. (Author abstract)

Electric Power

**089587** ON A TOTAL ELECTRIC POWER EVALUATION FOR A REFRIGERATOR SYSTEM WITH RESPECT TO THE AMBIENT TEMPERATURE VARIATIONS. This paper is concerned with an evaluation of the total electric power of a refrigerator with respect to variations of the ambient temperature. An evaluation of the total electric power is firstly established by using mathematical models of the refrigerator system with parameters estimated under a certain ambient temperature. Secondly, increment of the total electric power by the ambient temperature variation is evaluated by the gain schedule scheme. Finally, after assuming the relation between the ambient temperature variation and a few parameters of the mathematical models, evaluation of the total electric power of a refrigerator system is performed. Energy Conservation

**089588** ENERGIEKOSTENREDUZIERUNG BEIM BETRIEB EINER ZENTRALEN GROSSKAELEANLAGE DURCH OPTIMIERUNG DER KOMPONENTEN UND DER BETRIEBSBEDINGUNGEN. [Energy Cost Reduction in Large Central Refrigeration Units by Optimization of Components and Operating Conditions]. An 11 MW refrigeration unit was installed in 1984 at the Sandbochum shaft of Heinrich-Robert mine, Hamm, of the RAG. The plant was extended to a net refrigerating capacity of 15 MW in 1986. The surface refrigeration plant provides air conditioning for the working points below the 1000 m level via a cold-water network with a length of 70 km. Investments for the whole cooling system amounted to DM 30 million. The annual operating costs are in the range of DM 8.5 million, of which nearly DM 6.5 million (about 76%) are energy costs. The additional capital recovery factor is not considered in these figures, which clearly indicate why the reduction of energy consumption was an important planning aspect from the very beginning. **089593 REFRIGERATION FOR HORTICULTURE.** Nearly all fresh produce requires cooling, storing and transporting under conditions of uniform temperature and very high relative humidity if deterioration is to be minimised. In Australia most post harvest facilities have not been designed to obtain optimum conditions. This may be due to a lack of understanding of the product needs and how they interact with the environment. In part, it is also due to a lack of specialised refrigeration systems, and information regarding cost benefits to obtain and maintain post harvest environments closer to the optimum conditions. This paper explains the nature of fresh produce, the interaction with its environment and provides some refrigeration design guidelines. (Author abstract) 53 refs.

## Simulation

**089594 REFRIGERATION SYSTEM SIMULATION TO REDUCE ENERGY CONSUMPTION.** In refrigeration systems based on vapour compression, pure substances (i.e. ammonia, ethylene, and propane, etc.) are generally used as cooling media. In this case, the evaporation and condensation proceed at constant temperature. In practice, however, the cooling media may also contain additional components. This is the case when technological streams are used for this purpose. If so, the evaporation and condensation take place in a temperature range, modifying the compression and heat exchange conditions. An application of the MASTEP flowsheeting programme for refrigeration system analysis is presented. Case studies were carried out to investigate how the energy consumption depends on the concentration of additional components in propane as cooling medium. Generation of the model, the calculation strategy and some results are discussed. (Edited author abstract) 3 refs.

**089595 PERFORMANCE OF AN AQUA-AMMONIA ABSORPTION SOLAR REFRIGERATOR AT SUB-FREEZING EVAPORATOR CONDITIONS.** Ice making by means of a solar-assisted aqua-ammonia absorption refrigeration unit at sub-freezing evaporator conditions is considered in terms of its technical and economic feasibility. A computer-aided thermodynamic analysis is performed for various ranges of operation parameters, three climatic locations varying from 15°N to 43°N latitude and four solar collector types, i.e. flat plate, compound parabolic collector, and east-west and north-south axis tracking concentrators. In order to use an air-cooled condenser, the simulation is predicted on an absorber temperature of 35°C and a condenser temperature of 38°C. The results indicate that for generator pressures of 1.02 to 2.07 MPa, generator temperatures greater than 120°C are required. At these conditions, the COP is on the order of 0.5 and a conventional flat plate collector is not satisfactory. For the three climates, the compound parabolic collector (CPC) has a higher output than an east-west axis tracking concentrator but less than the north-south tracker. **089601 PARAMETRIC EFFECTS ON THE PERFORMANCE OF A SOLAR-POWERED SOLID ABSORPTION REFRIGERATOR.** Further tests were carried out on a solar powered solid absorption refrigerator. The solid absorbent was CaCl<sub>2</sub> treated with CaSO<sub>4</sub> to increase its resistance to compacting and disintegration, while maintaining a good absorbent granule porosity. The refrigerant was NH<sub>3</sub>. Tests were carried out over the annual climatic variations at Nsukka, Nigeria. In addition, the generation stage was started at nominal pressure of 900, 500, and 200 kPa to determine the effect of charging pressure on the COP. The experiments also provided longer-term performance tests of the absorption/generation capability of the absorbent. Cooling was obtained for all test months except for July and August. For the dry and the harmattan climates, the useful overall COP varied over 0.017 to 0.053 and 0.008 to 0.042, respectively. Maximum daily useful cooling and ice production were 833.3 kJ/m<sup>2</sup> and 1.65 Kg/m<sup>2</sup>, from the 1.41 m<sup>2</sup> collector. The available overall COP initially increased with charging pressure but became insensitive to it at higher pressures. (Edited author abstract) 12 refs.

**089603 MODELING AND SIMULATION STUDIES ON SINGLE/DOUBLE-EFFECT ABSORPTION CYCLE USING WATER-MULTICOMPONENT SALT (MCS) MIXTURE.** This communication presents an investigation on modeling and simulation studies of single/double-effect absorption cooling systems using a water-multicomponent salt mixture vis-a-vis water-LiCl-CaCl<sub>2</sub>-Zn(NO<sub>3</sub>)<sub>2</sub> solution as a working fluid. The computer modeling/simulation is based on mass, material, and heat balance equations for each component of the system. Effects of different input variables used for the computer modeling and simulation studies are investigated and a detailed parametric study of the double-effect cycle is carried out. A comparative study of the water -

multicomponent salt (MCS) mixture and the conventional water - LiBr mixture is also presented for both single-stage and double-effect absorption cycles. It is found that the cooling COP of the double-effect cycle is nearly twice of the single-stage cycle for both of the working fluids under the same operating conditions. The system feasibility and constraints are also discussed. (Edited author abstract) 17 refs.

Kaushik, S.C. (Indian Inst of Technology, New Delhi, India); Gadhi, S.M.B.; Agarwal, R.S.; Kumari, R. *Sol Energy* v 40 n 5 1988 p 431-441.

**089604 PERFORMANCE LIMITATIONS OF ADSORPTION CYCLES FOR SOLAR COOLING.** Adsorption cycles for solar cooling are described and past work reviewed. Zeolites have been used as adsorbents in many systems, but this work concentrates on activated charcoal adsorption. A general study of the cycle thermodynamics shows that provided the latent heat of the refrigerant exceeds about 1000 kJ/kg and the concentration change exceeds about 10% then the coefficient of performance (COP) can only be slightly improved by further increase. Looking at activated charcoal in particular, the Dubinin-Astakhov (D-A) equation is used to predict cycle COPs based on limited data available for chosen refrigerants and carbons. Of the refrigerants that are subatmospheric at  $-10^{\circ}\text{C}$ , methanol, acetonitrile, methyl amine, and  $\text{NO}_2$  are suitable, with methanol giving the best COP. Of the refrigerants above atmospheric pressure at  $-10^{\circ}\text{C}$ , ammonia, formaldehyde, and  $\text{SO}_2$  are suitable. Overall, methanol gives the best COP, with 0.5 being achievable in a single-stage cycle. (Author abstract) 23 refs.

## Thermodynamics

**089607 ADIABATIC EXPANSION-EXHAUST REGENERATIVE REFRIGERATING CYCLE.** This paper proposes a new closed cryogenic refrigerating cycle, the adiabatic expansion-exhaust regenerative cycle, which may be called a modified Gifford-McMahon (G-M) cycle. A cryocooler with this cycle has the advantages of simple construction, long unattended continuous running time and vibration-free operation, similar to G-M cryocoolers. This cycle can also be used in one-stage or multistage cryocoolers. A comparison between this cycle and the G-M cycle, the operating procedure and a thermodynamic analysis of the new cycle are presented in this paper. (Author abstract) 4 refs.

Wan, Weiwu (Jiaotong Univ, Xian, China). *Cryogenics* v 27 n 10 Oct 1987 p 577-581.

**089608 THERMODYNAMIC CYCLES FOR REFRIGERATION AND HEAT TRANSFORMER UNITS  $\text{H}_2\text{O}/\text{LiBr}$ .** The exact theoretical refrigeration and transformer thermodynamic cycles, of units working with  $\text{H}_2\text{O}/\text{LiBr}$ , are presented on the enthalpy-temperature as well as on the temperature-entropy diagram. The heat quantities involved have been calculated for many such cycles. Afterwards the results have been correlated by short relations allowing fast computation of the related quantities. The fast algorithm obtained can be used to predict optimal operating conditions in a very short computer time even if personal computers are used to 8 refs.

## Transportation

**089610 REFRIGERATED TRANSPORT BY SEA.** Sea transport of refrigerated goods is a vital link in the cold chain conveying perishables from producer to consumer. Despite the unprecedented crisis at present afflicting marine transportation and shipyards, sea refrigerated transport has experimented with important advances in the last few years. A 'reefer' ship is today a complex structure, with a great deal of computer technology and automation installed onboard. Ships are always ships, they may have lost some of the fascinating allure of the past, only to become sophisticated, specialized and efficient tools, up to the expectations of today's way of life. This paper concentrates on cargo ships and fishing vessels and omits references to the specialized vessels required for liquefied gases. (Author abstract)

Computer Aided Manufacturing

**089614 MANUFACTURING REFRIGERATORS WITH PEOPLE-BASED AUTOMATION.** In 1986 General Electric opened the doors to a new, computer-integrated manufacturing facility in Columbia, TN. The mission of the plant was to build, at a rate of 1.5 million units/year, rotary refrigerator compressors that are 50% smaller, weigh 50% less, and have 60% fewer parts than typical reciprocating units. In 1987, GE's Louisville, KY plant was given the task of building 1000 + refrigerators/day, in 100 different models, using the compressors manufactured in the Columbia facility. GE Fanuc Automation North America, Inc. has been supporting GE Appliances in this two-phase project, which is now just about completed. GE Fanuc designed and implemented a plant-wide information system called ACONS (automated compressor on-line system) for the Columbia facility, and designed a SMART (shop management recording and tracking) system for the Louisville plant. The article details the hardware and software aspects of each portion of this project, and outlines the planning, implementation, and manufacturing strategies that were needed to bring the project to successful completion.

Defrosting See Also REFRIGERATION—Efficiency.

**089616 THERMAL RESISTANCE OF FROST ON A FINNED AIR COOLER.** Results are given from

measuring the thermal resistance of frost on finned air coolers. We have measured resistances for frost on finned air coolers having corridor-type tube bundles and various fin stacks. The apparatus was built up from sections of length 170 mm, which each contained two longitudinal rows of tubes and five transverse ones, diameter 25 mm and pitches 70 and 76 mm correspondingly. The flat solid fins were made of 0.4 mm steel. The set thermal conditions were provided by an independent refrigerator. The coolant was ammonia, and its temperature was measured along with the temperatures of the tube walls, ribs, and air by means of thermocouples. The heat load was determined from the heat balances for the air and coolant, and the flow rates were measured. 9 refs.

**089617 BEREIFUNG UND ABTAUUNG VON LUFTKUEHLERN: THEORETISCHE GESICHTSPUNKTE, VERSUCHSERGEBNISSE, STANDARD NEN 1876, SYSTEMOPTIMIERUNG.** [Ice Formation and Defrosting of Air Coolers: Theoretical Aspects, Test Results, Standard NEN 1876, System Optimization]. During a period of more than ten years fundamental research on frost formation and defrosting behavior of lamel-type air cooler has been carried out. Experiments have been performed to support the Dutch Standard for testing air coolers NEN 1876. This standard gives an objective description of the performance of air coolers under being conditions. For the system designer it is very important to judge the average cooling performance and coefficient of performance during the total cycle, consisting of a cooling period and a defrosting period. For these values two dimensionless numbers were derived, which make it possible to determine - by using computer models - the optimum cooling period until defrosting starts. Finally, the use of the developed theories for (cost) optimization of refrigerating plants and the latest experiences with the Dutch standard for air coolers NEN 1876 are discussed. (Author abstract) 12 refs. In German.

Machielsen, H.M. *Ki Klima Kaelte Heiz* v 16 n 4 Apr 1988 p 178-183.

**089618 HOT GAS DEFROST FOR INDUSTRIAL REFRIGERATION.** Frost buildup on evaporator surfaces is a common occurrence with many refrigeration applications. Moisture from air infiltration and often from products in a freezer or cold room condenses and freezes on cold surfaces. The evaporator, being the coldest surface in the room, attracts much of this moisture. When the evaporator surface temperature is below 32 F, ice forms on it. This must be periodically removed before it becomes so great that operating performance suffers. The most common method used to defrost industrial evaporators is with hot gas. Defrosting evaporator coils is essential in ammonia and halocarbon refrigeration systems. Too few, too many, and too long defrost cycles waste energy and money. The paper shows how to handle hot gas defrost safely and economically.

Strong, Arthur P. (Parker Hannifin Corp, Wheeling, IL, USA). *Heat Piping Air Cond* v 60 n 7 Jul 1988 p 71-83.

**089619 ADAPTIVE DEMAND DEFROST AND TWO-ZONE CONTROL AND MONITOR SYSTEM FOR REFRIGERATION PRODUCTS.** A defrost system that adapts to usage patterns and ambient conditions is described. The following parameters determine the interval between defrost operations: the amount and duration of door openings, the length of previous defrost operations, and the current freezer temperature. A two-temperature control system which allows the user to independently select freezer and fresh-food compartment temperatures is also discussed. The compressor run time and the air flow to the fresh-food compartment are controlled to achieve the desired results. These controls have been incorporated in a total control and monitor system which was recently introduced. The other features of this control are also briefly described.

## Manufacture

**089622 PREDICT PROBLEMS & PREVENT THEM...BY MANAGING DATA.** To effectively manage automation's processes requires appropriate tools. Two of GE's refrigerator assembly plants - one in Louisville, Ky., and one in Columbia, Tenn. - use factory control and information systems that let factory personnel anticipate problems and stop them before they happen. The SMART (Shop Management Recording and Tracking) system, includes some key quality control tools and oversees an automated subassembly area, two final assembly lines, supporting fabrication machines, and several overhead conveyor systems. The Automated Compressor On-Line System (ACONS) is used to monitor data flow.

Allen, Linda G. (Automation, Cleveland, OH, USA). *Automation (Cleveland)* v 35 n 1 Jan 1988 p 72-74, 76.

## Noise

**089623 GERAEUSCHE IN KALTEANLAGEN UND DEREN PRAKTIISCHE BESEITIGUNG.** [Noise and Noise Abatement Measures in Refrigeration Systems]. Noise reduction specifications have become more rigid for the field of refrigeration equipment, air conditioning systems and heat pumps these last few years, especially in domestic HVAC systems which affect humans most directly. To comply with these requirements, producers, planners and fitters must work together even more closely than before. In German. 6 refs.

Koerner, F. *Ki Klima Kaelte Heiz* v 16 n 1 Jan 1988 p 25-29.

Performance See Also REFRIGERATION—Solar.

**089624 SOLAR COLLECTOR OPERATING TEMPERATURES FOR MAXIMUM COEFFICIENT OF PERFORMANCE OF AN ABSORPTION REFRIGERATION SYSTEM.** For an absorption refrigeration system, the coefficient of performance (COP) increases as the energy supply temperature increases. This discrepancy shows that any solar collector-absorption refrigerator

combination will have an optimum operating temperature. An attempt has been made to determine the optimum operating temperatures of a linear solar concentrator with a tubular receiver for maximum coefficient of performance of an absorption refrigeration system. The effects of absorber temperature, emissivity of absorber and wind loss coefficient on the heat loss factor has been taken into account in obtaining the optimum system performance. (Edited author abstract) 4 refs.

## Temperature Control

**089625 TECHNICAL NOTE: DESIGN OF A 16-CHANNEL TEMPERATURE MONITOR.** A system was designed to monitor and display the temperature of thirteen refrigerators in the hospital's clinical laboratory. The system includes programmable high and low alarms, a panel meter to display temperature, yellow light-emitting diodes (LEDs) for refrigerator indication, red LEDs for high alarms, and green LEDs for low alarms. The system presented here has been in operation for over three years and has been shown to be reliable, inexpensive, and useful for periodic data collection. (Author abstract)

Loney, John W. (California Univ of Pennsylvania, California, PA, USA). *J Clin Eng* v 13 n 2 Mar-Apr 1988 p 139-143.

## Vibrations

**089626 STUDY OF NOISE AND VIBRATION IN THE MOTOR-COMPRESSOR UNIT OF HOME REFRIGERATORS.** Higher demands have been expected of refrigerators with respect to their noise level, which mainly depends on performance characteristics of the motor-compressor unit. It is difficult to control the noise level produced by the refrigerator under the circumstances of large batch conveyor production since the environmental noise (in the shop) exceeds the allowed limits of noise by 15-20 decibels. In Saratov's Polytechnical Institute research work aimed at investigating disturbances and vibrations of the motor compressor was carried out. It resulted in a procedure for routine monitoring of refrigerator noise by its vibration level. 2 refs.

REFUSE DISPOSAL See Also BORON; INDUSTRIAL WASTES—Management.

**089627 HOUSEHOLD WASTE THREATENS HAULER AND LANDFILL SAFETY.** The U.S. Environmental Protection Agency (EPA) reports that household hazardous wastes have been found in the environment. The agency also says that indirect evidence suggests that these wastes contribute to groundwater contamination detected at a number of municipal disposal sites around the country. The agency is developing a proposal with new standards for municipal waste sites. The proposal will include standards for groundwater monitoring and corrective actions to deal with contamination. It will not, however, specifically exclude household hazardous waste from municipal landfills.

Adkins, Janis M. *World Wastes* v 30 n 10 Oct 1987 p 38-39.

**089628 PROGRESSI NELLE TECNOLOGIE DI TRATTAMENTO E SMALTIMENTO DEI RIFIUTI SOLIDI URBANI.** [Developments in Technologies for the Treatment and Disposal of Solid Urban Wastes]. Systems and methods of treatment of solid wastes, such as composting, recycling, incinerating and dumping are described. Some innovations introduced in Italy are also

dealt with on the basis of a comparison with the developments which have taken place in other countries. (Author abstract) In Italian.

Mantellini, G. (De Bartolomeis SpA, Milan, Italy). *Energ Alternative Habitat Territ Energ* v 9 n 46 Mar-Apr 1987 p 122-126.

**089629 LESSONS FROM THE FAR EAST.** Japan is considered by many to lead the way in garbage control. Recycling has been a way of life in Japan for over a century, largely because the country has no choice. This article discusses two books that describe the Japanese approach to management and recycling of wastes: Garbage Management in Japan: Leading the Way, by Allen Hershkowitz and Eugene Salerni; and Recycling '87: Turning Waste Into Resources, The Clean Japan Center.

Logsdon, Gene. *BioCycle* v 29 n 6 Jul 1988 P29.

## Analysis

**089630 MUNICIPAL SOLID WASTE COMPOSITION AND THE BEHAVIOR OF METALS IN INCINERATOR ASHES.** The composition of municipal solid wastes (MSW) from residential service areas was categorized and residuals from MSW incineration were examined for metal content and leachability. Sample size, sampling methodology, segregation by category and homogeneity of service area were determined to be dominant factors influencing the composition of MSW. There were notable differences in metal content of the fly and bottom ash residuals. Lead and zinc were the dominant trace metals in both ash residuals. Concentrations of cadmium and lead leached from the flyash were found to exceed EP limits. Lead and cadmium of both bottom ash and flyash fail proposed TCLP extraction limits by even larger margins. Permanent elimination of high-temperature process ashes, classified as hazardous, must be demonstrated. (Edited author abstract) 30 refs.

Clapp, T.L. (Rutgers, The State Univ, Piscataway, NJ, USA); Magee, J.F. II; Ahlert, R.C.; Kosson, D.S. *Environ Prog* v 7 n 1 Feb 1988 p 22-30.

## Auckland, New Zealand

**089631 SOLID WASTE DISPOSAL TECHNIQUES IN AUCKLAND OVER THE LAST 40 YEARS.** This paper traces the continuing efforts that have been made in Auckland over forty years to make better use of the community's solid waste. A petition to Government to investigate the composting of municipal wastes was followed by the setting up of a pilot plant by Auckland City Council and Government on a shared basis. The successful experiments enabled the Council to establish the country's first major mechanical composting plant after full overseas investigation by the author, who later was again able to recommend a solution to the disposal problems in West Auckland and was instrumental in establishing a solid waste baling and recycling station for the Waitamata City Council. Details of the pilot and major composting plants have been published but this fuller description of the solid waste baling system has not been recorded. (Author abstract) 6 refs.

Hutchinson, George A. *Trans Inst Prof Eng NZ Civ Eng Sect* v 14 n 2 Jul 1987 p 101-104.

## Baltimore, Maryland

**089632 BALTIMORE SHAPES UP AND GETS WISE TO WASTE.** After years of deterioration, the future looks bright for the city's incineration, recycling and landfill plans. The Baltimore Resource Energy Systems Co. (BRESKO), whose parent company is Wheelabrator-Frye, became a welcome replacement to a former pyrolysis plant that baked solid waste and reduced it to an ash-like material. In 1987, the BRESKO incinerator processed 723,000 tons of solid waste, up from 719,900 tons in 1986 and 671,600 tons in 1985. Overall for 1987, the plant sold 270,000 megawatts of electricity to Baltimore Gas and Electric Co. and sold over a billion pounds of steam to Baltimore Steam Co. These and other

aspects of the subject are discussed.

Brumback, Teresa. *World Wastes* v 31 n 8 Aug 1988 p 32-36.

**Bioconversion** See BIOGAS—Production.

**Cairo, Egypt** See WASTE DISPOSAL—Composting.

**Collection** See Also MOTOR TRUCKS—Refuse Collecting; REFUSE INCINERATORS—Waste Heat Utilization.

**089633 SOURCE SEPARATION IN AUSTIN.** Since 1982, Austin, Texas (population 450,000) has operated a curbside recycling program in the Solid Waste Services Division of the Department of Transportation and Public Services. Currently, 86,000 homes are serviced with curbside collection of source-separated newspaper, glass bottles and jars, and metal cans. During 1986, 4,000 tons of recyclables were collected by municipal crews. Ten (two person) collection crews collect recyclables from 50 recycling routes with an average size of 1,720 homes per route weekly. A combination truck/trailer system is used with seven Eager-Beaver 'Recycler 6' being the most prominent of the 13 trailers and seven two-ton stake body trucks being the majority of the 12 trucks. Assuming 120,000 homes will be serviced by 1988, it is estimated that the program will be collecting 10,800 tons of recyclable material per year.

Abramowitz, Richard (Dep of Transportation & Public Services, Austin, TX, USA). *BioCycle* v 28 n 8 Sep 1987 p 36-37.

**089634 CASH INCENTIVES AND THE RIGHT COLLECTION EQUIPMENT SAVE CITY MILLIONS.** A unique cash incentive program based on collected weight rather than number of stops - and on 31-yard rear-loaders rather than the more common 20- and 25-yarders - has resulted in five-year savings for Springfield, Massachusetts of \$2.7 million. The larger packers have enabled the city to handle all residential pickup with 11 vehicles instead of the 18 formerly used, resulting in reduced labor, fuel, depreciation, and maintenance costs totaling \$540,000 annually. Each three-man crew and its high-compaction loader now accumulates its union-accepted daily norm of 56,000 lb in two loads instead of the three or four loads required by the smaller haulers formerly used. These and other aspects of the program are discussed.

Anon. *Public Works* v 119 n 1 Jan 1988 p 56-57.

**089635 GOOD CASE FOR AUTOMATED COLLECTIONS.** With the elimination of lifting and carrying, users of the cart system are finding fewer health-related worker complaints. There has been a significant drop in back and hand injuries, and the job has become less strenuous for workers. By upgrading sanitation jobs, companies and municipalities are finding an improved on-the-job attitude. Productivity levels are rising, along with the longevity of collection workers. In addition to the reduced number of stops, the cart system may also save time at each stop. The average back yard service clocks in at 1:04 minutes. Additional savings have been realized as a result of the size of the carts. For private collection contractors, the cart system has proved to be cost-efficient as well as pleasing to the public.

Gates, Verna. *World Wastes* v 31 n 5 May 1988 p 41-42.

**089636 STUDY ON SEASONAL FLUCTUATION OF COLLECTED AMOUNT OF MUNICIPAL SOLID WASTE.** Seasonal fluctuation of collected amount of municipal solid waste in Sapporo is studied. In order to make characteristics of fluctuation pattern clear, collected amounts are normalized giving special consideration to national holidays and their next collection days on which amounts of waste sharply change. Correlation coefficients, moving averages and autocorrelation function are calculated to give quantitative information on the fluctuation pattern and to make comparison among different districts or years. In addition detailed investigations are carried out on the increase of waste in the periods

of December to January and March to May. Strong relationship between snow-thawing and people's behavior of waste production is confirmed. (Author abstract) In Japanese. 4 refs.

**089637 PHONE IN-TOSS OUT: THE BIRTH OF A PROGRAM.** This article reviews the 'pick up by appointment' program for refuse disposal which is used in Greece, New York. Collection techniques, scheduling, and public education are discussed.

Low, Thomas A. *Public Works* v 119 n 8 Jul 1988 p 72-73.

**089638 ANOTHER SUCCESS STORY FOR AUTOMATED COLLECTION.** The sanitation department was able to reduce its fleet of five manual sideloaders to a fleet of three new automated sideloaders. Requirements included long life, low maintenance, and air-over-hydraulic controls for fewer moving parts. The new system uses an automated arm, operator-controlled from the cab, that does all the lifting. One health and safety benefit is the elimination of lifting and handling of the refuse receptacles by collection crews. Since implementation of the container system, there has been a noticeable decrease in trash littering the area.

## Combustion

**089639 FATE OF SOME TRACE ELEMENTS IN FLUIDISED-BED COMBUSTION AND GASIFICATION PROCESSES.** Coal and municipal waste (MSW) contain many trace elements which are released upon combustion and gasification and have toxic forms at certain concentrations. These pollutants must be removed, if increasingly stricter emission standards are to be met. Cadmium (Cd), lead (Pb), zinc (Zn), and mercury (Hg) were selected for study and multicomponent, multiphase equilibrium calculations were carried out to determine which elements volatilize upon combustion and gasification and which ones condense upon cooling the flue gases. It was also intended to determine the distribution of the trace element species in the product streams. Both fluidised-bed combustion and gasification processes were studied having coal and municipal solid waste as fuel. (Edited author abstract) 41 refs.

**089640 NEW APPROACH IN SCHENECTADY.** Schenectady, New York, is the first to build and operate a composting plant using the American Bio Tech, Inc. in-vessel system. The Schenectady system is modular in design, with four full-size composting cells-two bioreactors for actual composting and two reactors for curing. There is also a fifth half cell used to condition the material prior to being loaded into the bioreactor. The mixture of sludge, sawdust and recycled compost is placed in this conditioning cell for about 24 hours, after which it is conveyed back to the mixer so that any necessary adjustments can be made. The material is then loaded into the bioreactor where there is a 13 to 14 day detention time, after which it is transferred to the cure cells where it stays for an additional 14 days.

Goldstein, Nora. *BioCycle* v 29 n 1 Jan 1988 p 28-30.

**089641 SHORTER HAULS FOR LEAVES.** 1987 set an all-time record for composting vegetative wastes with

many communities planning to launch programs in 1988. Composting is rapidly becoming the major method of leaf disposal. Jersey, New York, Pennsylvania and Massachusetts' new Recycling Act mandates that composting facilities be available to process leaves to keep them out of landfills. A similar law for Pennsylvania which passed overwhelmingly in the State Senate. The article presents examples of some old and new programs currently in operation.

Anon. *BioCycle* v 29 n 1 Jan 1988 p 34-35.

**089642** **TESTING IN PAPER BAGS.** A New Jersey leaf composting experiment turned up one strategy for success: using bags. The goals: to test the usefulness of bags similar to Umbro Corp.'s maintenance bag (SF-716) as a receptacle for leaves and yard waste for residential users; and to observe the results of incorporating this bag into a composting system. Particular activities undertaken were: surveying public acceptance of this bag compared to other bags for leaf collection; gauging the effectiveness of this bag in holding leaves and other typical yard wastes (twig, weeds, garden debris) under normal use and weather conditions; composting the bags and leaves (according to guidelines provided by Rutgers University's Department of Environmental Science); and drawing conclusions on how to utilize a compostable bag in collection and composting of leaves. Study methods and results are discussed.

Petto, Paul A. *Waste Age* v 19 n 5 May 1988 p 71, 74-75.

**089643** **EUROPEAN COMPOSTING STUDY TOUR.** A fact-finding study tour of Europe was conducted last October by the Michigan Department of Natural Resources for the state's opinion leaders to determine the feasibility of using compost technology to process municipal solid waste. The tour group had the unique opportunity to visit a wide variety of approaches to resource recovery alternatives. They ranged from composting of yard wastes and mixed municipal solid waste to pyrolysis of organic refuse, methane products by anaerobic digestion of organics to various types of source and site separation recycling collection programs integrated with various types of composting projects.

**089644** **30 YEARS OF REFUSE/SLUDGE COMPOSTING.** The composting plant in Duisburg, Germany celebrated its 30th anniversary in December, 1987. The plant serves 95,000 inhabitants in a suburban region of mainly one and two family houses with gardens. At present, the plant processes household waste nine months of the year, and during the three autumn months, treats leaves from the entire city as well as manure from the slaughterhouse and zoo. While garbage and other wastes can be composted together, it is most urgent to treat the large seasonal quantities of garden waste; secondly, these components yield an especially good quality compost. This article discusses the garbage/sludge composting process, and sale of products.

Ernst, A.A. (Duisburg/Huckingen Compost Facility, West Ger). *BioCycle* v 29 n 6 Jul 1988 p 34-35.

**089645** **TRENDS IN YARD WASTE COMPOSTING.** A series of thorough tests conducted in Switzerland and West Germany resulted in information regarding the sources of heavy metal contents in domestic garbage and demonstrated that the selection of compostable garbage can be based on definable criteria and that compost derived from consistent separation of garbage collection would meet the requirements. The trend toward yard waste composting has clearly taken hold and has produced, albeit on a small scale, plants with 200 to 25,000 tons annual capacity. The tipping fee for the treatment of organic waste is about 30 dollars to 50 dollars per ton. In Uzwil, Switzerland, a local cooperative operated a combined garbage incineration and composting plant from 1969 to 1984. The plant was renovated and some new

equipment was added in order to process and compost yard waste. The capacity of the plant is 10 tpd. In 1987, approximately 45,000 citizens were served by the plant and the amount of yard waste composted came to 1,200 tons. The article discusses the plant design and performance, as well as design of larger plants, product evaluation, and market potential. 6 Refs.

**089646** **DYNAMIC SIMULATION OF A TWO-PHASE ANAEROBIC DIGESTION SYSTEM FOR SOLID WASTES.** In this article, a two-phase system for the digestion of wastes with a high solid content is simulated. The solids are charged to the hydrolyzer and then leachate recirculation is activated until biodegradation is nearly complete. Several parameters are tested, namely moisture, leachate recirculation flow rate, and hydrolyzer-methanizer volume ratio. The results show that recirculation rate is an important parameter subject to optimization, with optimal values corresponding to hydrolyzer hydraulic retention times below 1 day. The quantity of recirculating water must be the highest possible. As a consequence, the organic load to the methanizer is reduced, making thus possible the use of a smaller methanizer volume. (Author abstract) 11 refs.

## Economics

**089650** **HOUSEHOLD REFUSE: RECOVERY OR DISPOSAL? RESEARCH FOR A NEW ECONOMIC OPTIMUM.** The alternatives of recovery or disposal of household refuse (MSW) lead to a conflict between the logic of the classical market-economy, with decreasing returns of scale, and that of public service - often undertaken by private companies (privatisation) - with increasing returns of scale. The problem is first considered in the same urban area. To reach the financial optimum for the municipality, one condition is a 'pay-back', for the service, to the recovery sector. It is also necessary to examine the effects of a generalization of the pay-back solution at a macro-economic level. The result also depends on the practical rules of auction and collection (selective and extensive, or exhaustive). In addition the integration of the recovery with the disposal, and vice versa, is examined. (Author abstract) 4 refs.

## Fermentation

**089651** **METHANIZATION: ECONOMICAL ALTERNATIVE FOR SOLID WASTE DISPOSAL.** In La Buisse, France, a syndicate of 16 small communities uses a unique waste disposal facility to dispose of its municipal solid wastes. The disposal process, which combines resource recovery, methanization, and incineration, benefits the communities two ways. The key to the Valorga process is anaerobic fermentation. The La Buisse facility, which is located near Grenoble, was originally a composting plant. In 1984, the methanization unit and the refining unit were added. The facility has a treatment capacity of about 15,000 tons of domestic waste per year, or 60 tpd. The system at La Buisse accelerates the methane digestion process and reduces fermentation time. The 400-cubic meter digestion system at La Buisse yields a daily output of about 2,000 cubic meters.

Bonhome, Michel (Valorga, Vendargues, Fr); Clauquin, Catherine. *Public Works* v 119 n 6 May 1988 p 60-62.

## Florida

**089652** **FLORIDA MAY NOT HAVE ITS ACT TOGETHER.** In 1979, the Department of Environmental Regulation (DER), conscious of the state's high water table and sandy soil, organized a Resource Recovery Council. Acting under authority of a state law, the Council directed 19 of the state's most populous counties to come up with resource recovery and comprehensive solid waste management plans. That early planning effort is probably the reason Florida leads the nation today in refuse-to-energy. Nine plants are on-line, four are under construction, and another five are on the drawing boards. Eight counties are conducting feasibility studies. The bottom line: By 1995, the state thinks it will have 18 facilities operating, with a total capacity of 22,000 tpd. But with the state's current generation of about 66,000 tons of refuse per day and its high-growth future, the state's disposal capacity may never catch up to its needs.

**089655 ASSESSING THE HEALTH RISKS FROM MUNICIPAL WASTE INCINERATION: AN EXAMPLE FROM PHILADELPHIA.** In July 1986, Philadelphia Mayor W. Wilson Goode announced that he would commission a risk assessment for a controversial trash-to-steam plant proposed by his administration. The risk assessment led to a hardening of positions for and against the plant. A team of Philadelphia-area physicians hired ICF-Clement Associates, a Washington-based consulting firm, to perform the analysis. The risk assessment team had to answer two questions: 1) What health risks are associated with emissions from the facility? 2) Will the plant's emissions increase the incidence of cancer in South Philadelphia, the proposed site for the plant? In its analysis, ICF-Clement used a formalized risk assessment procedure.

**089658 HEATING VALUE OF MUNICIPAL SOLID WASTE.** This paper describes the processes that are used to calculate the heating value of municipal solid waste in France. The calculation can be done either by using the thermal-balance method of a furnace or a furnace-boiler unit, or by sorting the refuse and calculating the heating value of the homogeneous components. Both methods are described in this paper. The first method measures the heating value of the refuse that is injected into the furnace; the furnace becomes a calorimeter in which thermal balance is achieved on measuring the input and output heats. The second method consists of sorting a 100 kg refuse sample into piles that are as homogeneous as possible so that it can be considered as unchanging. The heating value is determined for each component and the lower heating value of the whole sample is calculated. The advantages and drawbacks of both methods are discussed. (Author abstract) 1 ref.

**089659 MUELLVERBRENNUNG IN WASSERGEKUEHLTEN DREHROHRROST.** [Refuse Incineration in a Water-cooled Rotary Combustor]. The system described is an alternative to grate systems and rotary barrels with refractory lining. The rotary combustor barrel consists of water cooled tubes and perforated webs. As a result of optimum combustion conditions there are economical and environmental advantages. (Author abstract) In German.

Guttenbrunner, Manfred. *Stahlbau Rundsch* n 70 Apr 1988 p 12-13.

**089660 BETONTECHNISCHE BERICHTE. VERWERTUNG VON MUELLVERBRENNUNGSRUECKSTAEENDEN ZUR HERSTELLUNG ZEMENTGEBUNDENER BAUSTOFFE.** [Utilisation of Refuse Incineration Remnants for the Production of Cement-Bound Building Material]. An estimated 30 million tons of minerals, recycled building materials and secondary materials of lesser quality could annually be improved by the use of hydraulic binding agents to such an extent that they could be used as firm, durable and ecologically safe building materials. This way, high-quality raw materials and valuable dumping ground space could be saved. For every material in question a technological utilisation concept has to be developed. The Research Institute of the Cement Industry is developing such a concept for the utilisation of refuse incineration remnants for hydraulically bound support layers and for the concrete of secondary components as a pilot project. The aim of the experiment is to investigate durability, strength and deformation behaviour, constancy of volume and improvement of ecological properties which can be achieved by using appropriate binding agents. (Edited author abstract). 6 Refs. In German.

Schmidt, M. *Beton* v 38 n 6 Jun 1988 p238,241-245.

**089661 ENVIRONMENTAL IMPLICATIONS OF INCINERATION OF MUNICIPAL SOLID WASTE AND ASH DISPOSAL.** Environmental contamination from particulate and gaseous emissions containing heavy metals, polychlorinated dibenzodioxins (PCDD) and polychlorinated dibenzofurans (PCDF), polycyclic aromatics (PCA), acids and other compounds from such incinerators, as well as safe ash disposal, are of great

concern. Concentration ranges of elements and organic toxicants in incinerator ashes, emissions and cooling waters are given. The literature is reviewed concerning the effects of incinerator operating parameters on emissions. Incinerators equipped with modern pollution control devices (electrostatic precipitators, fabric filters, dry scrubbers, spray towers) and operated at optimum temperature with sufficient oxygen, turbulence (mixing) and residence time for complete combustion appear to minimize ash, elemental, gaseous and organic emissions. Environment aspects of municipal solid waste incineration are also considered and reviewed. (Edited author abstract). 180 Refs.

Jackson County, Michigan

**089662 PROGRESSIVE LANDFILL DESIGN MAKES JACKSON MODEL COUNTY.** The article is the first of a two-part series that examines the waste disposal program in Jackson County, Mich. The community's plan includes a new landfill - the subject of this article - and a 200 ton-per-day waste-to-energy facility. Although the incinerator is the more unique factor in the Jackson solid waste management equation, the landfill is an essential element in the overall plan. The landfill project is being developed in two phases. Only 35 acres are actually used for disposal. This project replaces an older landfill, closed in 1984, that was operated by the City of Jackson. Subjects covered include accounts computerization, tipping fees, landfill cell design, liners and others.

Hastreiter, Joe. *World Wastes* v 30 n 12 Dec 1987 p 26, 28.

Japan

**089663 SOLID WASTE REUSE IN JAPAN.** Solid waste management has come a long way in Japan in recent times. Recycling in Japan has been actively conducted by the government, municipalities, special bodies and volunteer groups. Most municipalities request households to separate refuse into three or more categories at source. This paper reviews the various reuse and recycling methods employed in Japan for handling solid wastes and provides statistics for these methods. Projects underway are discussed.

Fujita, Kenji; Kaneko, Hidehiro. *BioCycle* v 28 n 6 Jul 1987 p 28-32.

**Land Fill** See Also BIOGAS; BIOGAS—Quality Control; BIOGAS—Recovery; CLAY—Permeability; GAS DETECTORS—Computer Applications; GAS DETECTORS—Sampling; GAS MANUFACTURE—Waste Utilization; HAZARDOUS MATERIALS—Waste Disposal; LAND RECLAMATION—Planning; METHANE—Energy Utilization; METHANE—Production; PLASTICS SHEETS—Stability; SOILS—Contamination; SOLIDS—Waste Disposal; SYNTHESIS GAS; WASTE DISPOSAL; WASTE DISPOSAL—Recycling; WASTEWATER—Sludge Disposal; WATER POLLUTION; WATER POLLUTION—Canada; WATER POLLUTION—Underground.

**089664 SELECTING THE RIGHT SITE.** By following certain tactics and techniques, a public works director or other community officials can create a positive environment for a resource-recovery facility. While an existing landfill is an ideal site for a resource-recovery plant, a heavily industrialized area also is a good choice. The land has been zoned for commercial use, and the proximity to energy-purchasing customers may provide an economic benefit. Locations creating new traffic patterns through residential areas should be avoided. Once a site is chosen, the public needs to be sold on the idea. Opposition will occur, but if the program presents the facts there is no need to focus on the negative and assume a defensive position. The objective is to organize the 'project team'

with a plan of action. With virtually every waste-management project, the key to a successful public-acceptance campaign is advance planning.

Hunt, Patricia. *Am City City* v 102 n 8 Aug 1987 p RR6-RR7.

**089665 LANDFILL DRILLING - THINK SAFETY FIRST.** The contents of landfills are disposed of so that there is no subsequent human contact with them. Numerous problems that can be encountered when drilling at landfill sites are highlighted. In many cases sufficient information can be obtained through perimeter investigations and/or remote sensing. Problems encountered by the drill crews may be in part caused by an anxious, uninformed, and unsympathetic client, inflexible and incomplete specifications, design engineers who lacked field experience, inadequate air monitoring devices, and improper personnel protective equipment. The National Water Well Association has attempted to inform the ground water monitoring industry of the hazards of waste site activities through its five-day Safety at Hazardous Materials Sites Training course.

Maslansky, Steven P. *Water Well J* v 41 n 12 Dec 1987 p 26-27.

**089666 APPLICATION OF THE KENTUCKY NATURAL RESOURCES INFORMATION SYSTEM IN THE EVALUATION OF SANITARY LANDFILL SITE SUITABILITY.** This paper describes a project being implemented by the Kentucky Natural Resources and Environmental Protection Cabinet to assist local governments to better understand siting considerations and to identify potential landfill sites. The state's Natural Resources Information System (KNRIS), an automated geographic information system, is being used by local governments to conduct landfill site suitability analyses at a cost of less than \$150. (Edited author abstract) 8 refs.

**089667 INFLUENCE OF IRRIGATION WITH LEACHATE ON BIOMASS PRODUCTION AND EVAPOTRANSPIRATION ON A SANITARY LANDFILL.** The influence of irrigation with leachate on biomass production and evapotranspiration was studied on three sanitary landfills in southern Finland in 1982 - 1984. Irrigation with leachate increased biomass production significantly. The quality of the irrigation water and substrate, mode of irrigation and tree species also influenced biomass production. In a willow stand, 30% of the irrigation and precipitation was intercepted. Evapotranspiration calculations based on biomass production measurements, water consumption per unit dry matter produced and interception measurements gave results similar to the values obtained with the Penman - Monteith equation. Irrigation with leachate was found to increase evapotranspiration on a sanitary landfill. The evapotranspiration of the mini-rotation plantations during the growing season amounted to 600-700 mm. (Author abstract) Refs.

Ettala, Matti (Paavo Ristola Ltd, Salpakangas, Finl). *Aqua Fenn* v 17 n 1 1987 p 69-86.

**089668 UNDERLINING SECURITY FOR INCINERATOR ASH.** The article discusses a Millbury, Mass. facility that is using an ash monofill for disposing of approximately 375 tons of incinerator ash each day. Designed, built and operated by Wheelabrator, formerly Signal Environmental System Inc. of Hampton, N.H., the plant burns up to 1500 tons per day of solid waste from central Massachusetts. Incinerator ash from the Millbury plant is deposited at an ash monofill in Shrewsbury, Mass. The thirteen-acre site incorporates a single composite liner, consisting of two feet of compacted clay underneath a 60-mil HDPE geomembrane, manufactured and installed by Gundle Lining Systems Inc., Houston.

Cadwallader, Mark (Gundle Lining Systems Inc, Houston, TX, USA). *World Wastes* v 30 n 12 Dec 1987 p 29.

**089669 PVC CAP PROTECTS GROUNDWATER BENEATH LANDFILL.** As filled portions of the Lantana Sanitary Landfill are closed, Florida state law requires that they be capped, because the facility, which opened in the 1960s, lacks a bottom liner. The capping operation began early in 1987, with them membrane being installed in five to ten-acre increments. To protect the groundwater, the waste authority has specified a 1.3-million sq ft, 20-mil flexible PVC membrane supplied by Staff Industries, Inc., Detroit, Michigan. This article discusses materials selection, membrane installation, and erosion control considerations.

Hammond, Mark (Palm Beach County Solid Waste Authority, West Palm Beach, FL, USA). *Public Works* v 118 n 12 Dec 1987 p 34.

**089670 SYNTHETIC LINERS: A LOOK AT THE BASICS.** Flexible membrane liners (FMLs) are entering the forefront of the waste containment field, due to legislation protecting surface waters as well as groundwater protection regulations. Selecting a geomembrane can be complicated. No single membrane is universally suited for every application. The compatibility of chemicals the liner is likely to encounter with the liner material itself, while important, is only one of many characteristics to evaluate. This article presents basic information on the materials for selection and application of geomembranes in land fill applications.

Wilson, Felon R. (Seaman Corp, Wooster, OH, USA). *Waste Age* v 18 n 10 Oct 1987 p 139-140, 142, 144.

**089671 LAND-COVER MONITORING WITH SPOT FOR LANDFILL INVESTIGATIONS.** As an extension of an airphoto-based inventory of active and inactive waste storage and disposal sites in a New York county, SPOT satellite images were evaluated to determine their capacity for monitoring land-cover changes that could be significant in landfill investigations. A panchromatic and a multispectral image of 25 1.5-by-1.5-km sites were displayed and minimally enhanced (contrast stretched and enlarged) on a digital image processing system, where the imaged test sites were compared visually to the most recent 1:24,000-scale U.S. Geological Survey topographic maps. Significant changes - disturbed, reclaimed, and developed land; recently exposed soil; ponded water; and new or removed structures - were interpreted and delineated, based only on the images and maps. (Edited author abstract) 18 refs.

Philipson, Warren R. (USDA Agricultural Research Service, Beltsville, MD, USA); Barnaba, Eugenia M.; Williams, Vicki L.; Ingram, Arlynn. *Photogramm Eng Remote Sens* v 54 n 2 Feb 1988 p 223-228.

**089672 AUFBEREITUNG UND NUTZUNG VON DEPONIEGAS.** [Treatment and Utilization of Land-Fill Gas]. The gas forming in land fills as a result of bioconversion of organic refuse components must be disposed of. If possible, the disposal costs should be reduced through an economical utilization of the gas. Problems arise in the disposal when halogenated hydrocarbons appear in this biogas quite often as a result of the evaporation of spent solvents. During combustion, corrosive hydrogen chloride and, under certain circumstances, toxic compounds such as chlorinated dioxins and furans arise from the chlorinated hydrocarbons. The potential of land-fill gas, possible forms of economical utilization of it, and the required treatment of the gas are discussed. (Translated author abstract) In German. 22 refs.

Hedden, Kurt (Univ Karlsruhe, Karlsruhe, West Ger). *GWF Gas Wasserfach Gas Erdgas* v 128 n 11-12 Nov-Dec 1987 p 573-578.

**089673 BEACH COUNTY RESORTS TO STATE-OF-THE-ART LANDFILL.** The article discusses the recent construction of a facility in Cape May County, New Jersey, where conditions and regulations called for state-of-the-art construction. Any liquid escaping from Cape May County's landfill could leach into a sensitive aquifer below - one which serves all of southern New Jersey. A leachate containment system, using geo-

membranes, was incorporated into the facility's design to prevent contamination. With the site's first cell nearing capacity, municipal officials evaluated performance of their initial design before constructing the site's second cell. The system used in Phase I was judged successful at keeping landfill liquids out of the high water table; the same system is specified for Phase I-B. Subjects covered include the groundwater protection system, primary liner, and membrane seam testing.

Anon. *Waste Age* v 19 n 3 Mar 1988 p 95-96.

**089674 APPLICATION OF GEOPHYSICAL METHODS IN ENVIRONMENTAL AND MUNICIPAL ENGINEERING: THEORETICAL STUDY.** The purpose of the work described in this paper was to select suitable instrumentation for groundwater contamination surveys using geophysical methods. It is shown that galvanic resistivity methods are highly suitable for environmental surveys. The resolution meets the needs in shallow exploration of the earth, and multiarray profiling-sounding systems are even cost-effective in the field. The very large resistivity range that can be mapped with the method is a very advantageous property. Electromagnetic methods are theoretically suitable and coming in the future, but the currently available instrumentation does not cover high frequencies or the early time transients required. When applied in shallow soundings together with the vertical electromagnetic sounding technique, the combined inverse solution is more reliable. The use of soil temperature measurements in evaluating hydrogeologic conditions in groundwater flow systems was found to be unfeasible due to complications in interpreting the data. 112 refs.

**089675 OVERVIEW OF LANDFILL BOTTOM LINER HYDRAULICS.** Landfill bottom liners are important elements in the analysis and design of solid waste disposal facilities. This study presents an overview of several models, describing the flow over and through liners. The examined models are compared against data from a laboratory investigation. A quasi-steady state (QSS) and a transient (TS) model yield the most complete description of linear hydraulics, and allow for estimation of the system's collection efficiency. The TS model performed slightly better than the QSS model, although the latter has the advantage of simplicity. The hydraulic conductivities of the liner and the drainage layer and the leachate accretion rates are parameters whose magnitudes must be known with relative accuracy for good evaluation of system performance. (Author abstract) 12 refs.

**089676 PRETREATING LANDFILL LEACHATE WITH PEAT TO REMOVE METALS.** In this investigation, the capacity of peat to treat two different landfill leachates was determined. Freundlich isotherms showed that, for the tested metals (Cd, Cr, Cu, and Pb), an increased time of contact increased the level of adsorption over the entire range of influent values studied. In addition, metal interaction may play an important role in the adsorption of metals from leachate, as the various metal ions compete for the available adsorption sites on the peat. Column studies using two leachates, one from a municipal refuse fill (Al, Ca, Cd, Fe, Mg, Mn, Na, Pb), and one from a fill which receives mainly oil and fly ash (Al, Ca, Cr, Fe, Mg, Mn, Na, Pb, and Y), were conducted to establish design parameters for full-scale design. The efficiency of treatment was evaluated as a function of factors important for developing filter design criteria. (Edited author abstract) 15 refs.

**089677 HAZWASTE DUMPERS, KEEP OUT!** Chambers Development Co., Inc., is a publicly held, Pittsburgh-based, company that owns eight sanitary landfills and one transfer station. This large company's system uses high- and low-tech strategies to protect landfill integrity. At each landfill, except for a single gate, all possible site entrances have been either fenced in or made inaccessible via construction of a berm (behind which is a deep trench). The gate is manned full-time. During the day, trained gatekeepers keep an eye on every load, and the company's site manager performs random checks of the landfill. At unannounced times every day, four trucks pull up to a separate dump site, where the crews go through the trash carefully. Cameras record (on videotape) everything at the gate, every moment of the day and night. In addition, a further check, which involves the construction of scaffolds and the use of photoionization meters, has been in place since 1987.

**089678 GEOMEMBRANES FOR MUNICIPAL SOLID WASTE LANDFILLS.** Synthetic liners are highly attractive because of their negligible permeability and good chemical resistance. Liner technology has progressed to where the choice of synthetics for the 1980s is between some high quality polymers. High density polyethylene (HDPE), however, is the material of choice for solid and hazardous waste landfill applications. This article discusses the installation of a 12-acre HDPE lined landfill for Leon County, Florida, the first municipal landfill to be lined with a flexible membrane in the capital area of Florida.

Mathieson, Michael C. (Gundle Lining Systems Inc, Houston, TX, USA); Cadwallader, Mark W. *Public Works* v 119 n 6 May 1988 p 80-81.

**089679 POLYETHYLENE DRAINAGE NETS INCREASE LANDFILL CAPACITY.** Polyethylene nets used to provide drainage in landfills significantly increase their storage capacity. The nets replace the thicker sand and gravel covering layer normally used in landfills and also permit steeper side-wall angles. The nets consist of polyethylene strands that are cross-melt extruded to form a three-dimensional grid-like structure about ¼-in. thick. The interlocking strands result in a very strong netting. This configuration has very low compressibility and high capacity for liquid and/or gas flow. These characteristics allow the polyethylene netting to provide the same drainage channel as a much thicker layer of sand and gravel. It also allows the construction of steep side slopes.

Anon. *Public Works* v 119 n 6 May 1988 p 93.

**089680 PROBLEMS SURFACE FOR SWAT GAS PROGRAM.** A new California law (the Calderon Bill - AB3525 and AB3374) requires that landfills conduct rigorous tests to monitor their sites for toxic gas emissions. These Solid Waste Assessment Tests (SWAT) are expected to cost landfill operators millions of dollars in test fees and remedial actions. Enacted in 1986, the bill will produce a site-by-site inventory of gases entering the environment from active and inactive landfills. Compliance to the bill has been slow. A lack of money, time and proper lab equipment has slowed compliance with the air component of California's new SWAT program.

**089681 NITRIFICATION AND SUBSEQUENT DENITRIFICATION IN THE LAYER OF INCINERATOR RESIDUE.** Nitrification and denitrification in the semi-aerobic landfill of the circulatory type are experimentally studied. This landfill method is characterized by the circulation of leachate and has the advantage of the rapid decrease in the concentrations of organic matter and total-nitrogen with time. It was found that both nitrification and denitrification are caused in the reactors and that 0.94 g of organic carbon was consumed for the denitrification of 1 g of nitrogen. (Edited author abstract) 8 refs.

**089682 INFILTRATION AND HYDRAULIC CONDUCTIVITY AT A SANITARY LANDFILL.** High infiltration rate at a sanitary landfill indicates surface runoff to be small. This is why it is necessary to move the snow cover from the site and establish short-rotation plantation on the site in order to reduce infiltration and leachate discharge. The saturated hydraulic conductivity varied widely at two sanitary landfills differing in disposal technology and in different parts of the same site, too. This should be taken into account when water balance models are used. To allow management of the water movement and levels in the refuse, the landfills should have drainage systems at the bottom of the site. This is also necessary for controlling the degradation of the refuse. 19 refs.

**089683 DESIGN AND OPERATION OF LEACHATE CONTROL MEASURES AT COMPTON BASSETT LANDFILL SITE, WILTSHIRE, U.K.** This paper describes the conversion of a difficult landfill, inherited by Wiltshire County Council during local government re-organization in 1974, into a high-standard landfill, providing containment of wastes. It can now provide the capacity to continue to receive wastes for at least the next 30 or 40 years. An essential feature of these works is an on-site, automated leachate treatment plant. The design philosophy and difficulties encountered during the commissioning of the plant are described in this paper. Initial difficulties in treating large quantities of methanogenic leachate from saturated areas of waste have been overcome by a novel scheme, whereby a high-strength organic waste stream from a local jam factory is blended with the influent leachate streams for optimum treatment conditions. (Author abstract) 5 refs.

Robinson, Howard (Aspinwall & Co, Shrewsbury, Engl). *Waste Manage Res* v 5 n 2 Jun 1987 p 107-122.

**089684 TESTING LARGE LANDFILL SITES BEFORE CONSTRUCTION OF GAS RECOVERY FACILITIES.** The great variability in landfill refuse characteristics such as moisture, pH, temperature, cellulose content, age, and cover make it difficult to extrapolate test data from one site to another. The quantity of raw extractable gas from 23 GSF test sites was found to range from 4 to 29 l m<sup>-3</sup> day<sup>-1</sup> (0.11-0.78 CFID/CY) of refuse. By field testing of sites, the probability of a successful project can be greatly enhanced. On large landfills, the benefits of extensive testing outweigh initial costs. In addition to determining potential gas production, well tests also determine: the location of high perched water zones; concentrations of corrosive trace contaminants so that adequate pretreatment facilities can be designed; and composition of refuse samples to determine the rate of decay. This allows the developer to optimize plant size, resulting in maximum return on investment. (Edited author abstract) 7 refs.

Siegal, Joan P. (GSF Energy Inc, Signal Hill, CA, USA). *Waste Manage Res* v 5 n 2 Jun 1987 p 123-131.

**089685 HIGH BTU LANDFILL GAS RECOVERY UTILIZING PRESSURE SWING MDEA PROCESS.** The extraction and processing of landfill gas to pipeline quality specifications is a viable method for recovering landfill gas. A plant operating at the Central Disposal Sanitary Landfill in Pompano Beach, Florida, employs a proprietary process involving a methyldiethanolamine (MDEA) based solvent. The process utilizes a combination pressure-swing and thermal solvent-regeneration procedure which dramatically reduces energy requirements relative to those of traditional amine processes. Much of the equipment is skid mounted and modularized which reduces field installation costs and facilitates future removal to other sites. (Author abstract)

**089686 CRACK FORMATION IN SOIL LANDFILL COVERS DUE TO THERMAL CONTRACTION.** Soil landfill covers in the northern United States experience ground freezing to depths of 2 m or more. During periods of decreasing winter temperatures, thermal contraction will increase tensile stresses creating the potential for crack formation. A drop of only 2 or 3°C will generate significant tensile stresses. Climatological data show larger drops in temperature. Frozen cover soils are comparatively weak in tension. Cracks, once initiated, can propagate unstably through the frozen soil, and may extend deeper than the tensile stresses to which they owe their growth. Simple elastic soil behaviour used with thermal strains does not provide adequate information for predicting thermal contraction and crack formation. Information is needed on the thermal contraction behaviour of frozen soils, on the extent to which soil creep will reduce the tensile stresses, and on criteria suitable for preventing crack formation. (Edited author abstract) 8 refs.

**089687 NATURAL ATTENUATION MECHANISMS OF LANDFILL LEACHATE AND EFFECTS OF VARIOUS FACTORS ON THE MECHANISMS.** The paper identifies mechanisms by which landfill leachate is attenuated by soil and aquifer. The mechanisms are: adsorption, biological action, cation and anion exchange reactions, dilution, filtration, and precipitation reactions. Each mechanism is discussed separately. The major attenuation mechanism is identified for many municipal landfill leachate constituents. Effects of leachate velocity, degree of saturation, organic and inorganic matter in soil, clay type, soil fabric and soil stratigraphy on attenuation is discussed. (Author abstract) 45 refs.

**089688 PROBLEMS ASSOCIATED WITH BUILDING ON LANDFILL SITES.** Potential hazards facing landfill site developers are gas production, attack of building materials and subsidence. At some sites successful development may be possible provided that buildings are designed to overcome these problems. Design criteria are given with particular emphasis being placed on methods for preventing gas ingress. Examples of suitable buildings, which have been erected in the U.K. and the U.S.A. are given. (Author abstract) 24 refs.

**089689 WATER AND ELEMENT BALANCES OF MUNICIPAL SOLID WASTE LANDFILLS.** A major problem of sanitary landfills is the assessment of element transfers from inputs to outputs as a function of time. The prediction of gas and leachate generation is necessary for this purpose. Water and element balances for the non-metals carbon, nitrogen, fluorine, phosphorus, sulfur and chlorine and the metals iron, copper, zinc, cadmium, mercury and lead were investigated in four municipal solid waste landfills of various ages. Data from these mass balances were then used to develop a method that permits elucidation of the behaviour of landfill in its most active phase, i.e. that in which relatively high gas generation occurs. (Author abstract) 11 refs.

Baccini, P. (Swiss Federal Inst for Water Resources & Water Pollution Control, Duebendorf, Switz); Henseler, G.; Figi, R.; Belevi, H. *Waste Manage Res* v 5 n 4 Dec 1987 p 483-499.

**089690 LANDFILL LINER SYSTEMS KEEP WASTE FROM WATER.** Presently, more than half of all Americans rely on underground supplies for drinking water. Years of careless waste disposal and ignorance are threatening these very important reservoirs. Once contam-

inated, groundwater is difficult, if not impossible, to clean. At present, more than 200 foreign substances have been detected in this country's groundwater supplies. Therefore, a powerful impetus exists separate to design and construct land fills property to form effective barriers being waste from uncontaminated water. Liner systems form the critical components of these barriers. The hazardous-waste containment regulations require double-liner systems incorporating synthetic geomembranes. Liner-system criteria will be of EPA and presented as a way to comply with the performance standard.

Cadwallader, Mark (Gundle Lining Systems, Houston, TX, USA). *Am City Cty* v 103 n 5 May 1988 p 46.

**089691 TAKE BACK THE LAND.** Municipal sludge applied to land devastated by strip mining has brought thousands of acres of Ohio, Illinois, and Pennsylvania land back to life. Every year, municipal wastewater treatment facilities in the U.S. produce nearly 7 million dry metric tons of wastewater sludge. Experts' warnings that the figure will double by the year 2000 coupled with the high cost of incineration, shrinking landfill space and a movement away from ocean dumping made a search for new disposal options a necessity. Researchers have found that the organic matter and nutrients in treated sludge can help reclaim these ravaged areas. This paper describes some results of sludge application to the Pennsylvania Superfund site to restore plants and wildlife.

Anon. *Civ Eng (New York)* v 58 n 2 Feb 1988 p 52-55.

**089692 CONSTRUCTION GUIDE-LINERS.** Proper installation of geomembrane-soil composite lining systems for waste containment requires careful construction detail, monitoring and weather watching. Several types of geomembrane material are available for hazardous waste containment, the most frequently used being semicrystalline linear low-density polyethylene and crystalline high-density polyethylene. Both materials have shown chemical resistance to a broad range of wastes. In 1985, EPA's Minimum Technology Guidance on Double Liner Systems for Landfills and Surface Impoundments recommended a double lining system consisting of: primary leachate collection and removal system (for landfills); primary geomembrane liner; secondary leachate collection and removal system; and secondary composite liner, a geomembrane overlying a minimum of 3 ft of compacted clay.

**089693 DETERMINATION OF HEAVY METALS IN SAMPLES OF URBAN SOLID WASTES BY MEANS OF THE ICP ATOMIC SPECTROMETRY TECHNIQUE.** The concentration of elements of environmental significance in the leachate from landfills of urban solid wastes was determined by means of Inductively Coupled Plasma Atomic Emission Spectrometry (ICP-AES). The suitability of extraction tests which simulate the leaching process were undertaken. Both highly toxic elements (As, Cd, Co, Cr, Pb and V) and elements present at major concentrations (Al, B, Cu, Fe, Mn, Ni and Zn) were quantified at different levels within and under the landfill. Results showed that the extraction test recommended by EPA is acceptable in order to simulate natural leaching compared with the amounts of the elements which are brought into solution after digestion with nitric acid. Furthermore, significant correlations were found in the landfill composition at different levels for element pairs such as Al-Mn, Co-Cr, Co-Cu, Co-Fe, Co-Mn, Co-Zn, Cr-Fe, Cr-Mn, Cu-Fe, Cu-Zn, Fe-Mn, Fe-Zn, Mn-Zn and Pb-Zn. **089694 NEW HONG KONG LANDFILL DEMANDED EXTENSIVE PLANS.** Mott, Hay & Anderson, a Hong Kong-based consulting engineering firm, has designed an imaginative landfill system incorporating

extensive monitoring. The development of the Western New Territories (WENT) landfill, which will have a capacity of 56 million cubic meters, is one of the largest landfill sites in the world to have been designed from start to finish. The environmental security of the landfill has yet to be proved; but if it is successful, Hong Kong will have been provided with a facility for the disposal of industrial, commercial and domestic wastes well into the twenty-first century, thereby removing both a potential source of pollution and a possible constraint on industrial development so vital to the economic health of the city.

Shimell, Pamela (World Wastes, Atlanta, GA, USA). *World Wastes* v 31 n 7 Jul 1988 p 30-32,34.

**089695 LANDFILL CAPACITY: EVALUATING THE ESTIMATES.** The Environmental Institute for Waste Management Studies (EIWMS) at the University of Alabama has evaluated the feasibility of estimating the current capacity of U.S. landfills. The availability of demographic data and pertinent information on municipal waste landfills was compiled to determine the feasibility of a stratified random survey of landfill capacity in the United States. The article discusses past study efforts, and survey findings, including aggregate life of landfills in New York, remaining capacity of landfills in Alabama, and more.

**089697 PLASTIC BOTTLES BECOME LANDFILL CAP.** If results of a New Jersey landfill test of a new bonded membrane are positive, the application of recycled plastic beverage bottles as a landfill cap could lead to another use for the material - and savings to landfill owners, in substituting the membrane for costly clay in steep-slope landfill capping applications. Officials of the Hackensack Meadows Development Commission (HMDC) are running the test on the nonwoven geotextile. Spun from post-consumer plastic bottles, the geotextile in this application is bonded to a Hypalon-based containment membrane. The material is used to eliminate slippage of cover soils on steep slopes. Subjects covered include a discussion of the problems with clay, cost and performance benefits of the recycled plastics membrane, and others.

Anon. *Waste Age* v 19 n 7 Jul 1988 p 97-99.

**089698 BARGE TOWN PIGGYBACKS ITS LANDFILL.** Waste disposal officials in the town of Islip are taking landfill construction to new heights. Islip has not been able to obtain permission to expand from the state's Department of Environmental Conservation (DEC). As an interim measure, it has succeeded in gaining the regulators' consent to construct a new cell on top of a portion of the unlined landfill that had already been closed and capped. The vertical expansion, called 'piggybacking,' has raised the height of the 30-acre landfill another 80 feet. The net effect: Islip town officials gained 1.8 million cubic yards of new refuse disposal capacity. Three acres have been set aside for disposal of ash from the town's refuse-to-energy plant (now under construction).

**089700 CLAYEY BARRIER ASSESSMENT FOR IMPOUNDMENT OF DOMESTIC WASTE LEACHATE (SOUTHERN ONTARIO) INCLUDING CLAY-LEACHATE COMPATIBILITY BY HYDRAULIC CONDUCTIVITY TESTING.** The current use of engineered clayey barriers to control the chemical flux entering the groundwater adjacent to landfill sites is discussed. New analytical methods to predict flux-time relationships controlled by advection and diffusion are presented briefly, followed by an assessment of macropore flow problems inherent in laboratory and especially field-compacted clays. The clay-leachate compatibility of southern Ontario (Sarnia) clays is then assessed with respect to domestic waste leachate using hydraulic conductivity as the assessment tool. The dominant role of channel flow through macropores, even in very carefully controlled laboratory samples, is emphasized, as is the critical role of soil smectite and vermiculite in retardation of species such as  $K^+$  from domestic leachate. The Sarnia brown and gray clays seem compatible with domestic waste leachate at least with respect to hydraulic conductivity,  $k$ . In spite of extensive  $K^+$  retardation, leachate effected a slight decrease in  $k$  of the water-compacted brown and grey samples. (Edited author abstract). 28 Refs.

**089701 DETERMINATION OF ORGANIC VOLATILES IN AMBIENT AIR IN THE AREA OF A LANDFILL.** A study has been performed to analyse organic volatiles in ambient and soil air in the area of a landfill situated next to the city of Bielefeld. This dump has been filled up for years with very different, partially unknown wastes (solvents from metalworking industry, waste oils, sludges from galvanisation processes etc.). Finally the dump was covered with soil up to 2m and was used as a housebuilding area. The objective of this study was to quantify the influence of the landfill gas production on the quality of the ambient urban air.

**089702 REMOVAL OF ORGANICS FROM LEACHATES BY ANAEROBIC FILTER.** A laboratory-scale study was conducted on two anaerobic filters at several loading rates and four hydraulic detention times. Feed substrates were landfill leachates taken from a recently opened landfill (Keele Valley) and from an older site (Brock North) which had been closed for about 8 years. The strong raw leachate from the new landfill had a COD of 14,000 mg  $l^{-1}$ , a BOD/COD ratio of 0.7 and a COD/P value of 17,900. The partially stabilized leachate from the older landfill had a COD of only 3,750 mg  $l^{-1}$ .

<sup>1</sup>, a BOD/COD ratio of 0.3 and a COD/P value of 30,640. Results from the treatment of the two leachates were compared with those from a previous study of a 'mature' landfill (Beare Road). It was demonstrated that the anaerobic filter could reduce the COD of leachate from landfills of different ages by 90%, at loading rates of 1.26-1.45 kg COD m<sup>-3</sup> d<sup>-1</sup>. (Edited author abstract) 20 refs.

Henry, J.G. (Univ of Toronto, Toronto, Ont, Can); Prasad, D.; Young, H. *Water Res* v 21 n 11 Nov 1987 p 1395-1399.

**089703 TREATMENT OF LEACHATE FROM A SOLID WASTE LANDFILL SITE USING A TWO-STAGE ANAEROBIC FILTER.** Raw leachate was treated using a two-stage upflow anaerobic filter process. Leachate from a solid waste landfill site, which received both municipal and industrial wastes, contained high organic matter (17-21 g/L COD, 13-14 g/L BOD, and 3.5-4.6 g/L volatile acids), and low metal (Zn and Fe) concentrations. Depending on sampling time, leachate composition and characteristics varied considerably. At an organic loading up to 4 g COD/day<sup>2</sup> media area, the BOD and COD removal percentages were 98 and 91%, respectively. The biofilters were also effective for metal removal. However, the filter effluent contained a high concentration of ammonia. System overloading was characterized by the accumulation of large quantities of volatile acids and by a low ratio of alkalinity/volatile acids, resulting in low COD removal and reduced gas production. Once the first filter was upset, the second stage could only partially respond to the volatile acids accumulated in the effluent of first filter. (Author abstract) 41 refs.

Wu, Y.C. (New Jersey Inst of Technology, Newark, NJ, USA); Hao, O.J.; Ou, K.C.; Scholze, R.J. *Biotechnol Bioeng* v 31 n 3 Feb 20 1988 p 257-266.

**089704 IDENTIFICATION AND QUANTIFICATION OF VOLATILE ORGANIC SPECIES DURING MICROBIAL TREATMENT OF LEACHATE.** Sequential anaerobic/aerobic microbial populations, in a packed-bed configuration, were employed to biodegrade leachate from a high priority superfund site. Leachate characteristics included up to 100 ppm (as carbon) volatile organic priority pollutants. Identification and quantification of these pollutants at key steps in the biodegradation process is important. A method employing purge and trap concentration followed by gas chromatographic separation was developed for accurate identification and quantification of the volatile compounds of interest. Results obtained from application of this method to the leachate treatment process indicated that 84 to 99% of the specific volatile priority pollutants were biodegraded, under anaerobic conditions, during steady-state operation. (Author abstract) 6 refs.

**089705 N-BUTYRATE CATABOLISM IN THE TREATMENT OF A SEMI-SYNTHETIC LANDFILL LEACHATE ON ANAEROBIC FILTER UNDER SEQUENTIAL FEEDING CONDITIONS.** Calculations of the kinetics of volatile fatty acids removal in an anaerobic filter showed that methane production from n-butyrate was not consistent with  $\beta$ -oxidation when the reactor was operated under sequential feeding conditions. Under these conditions, n-butyrate might be anaerobically catabolized by decarboxylation. Iso-butyrate was formed at about 25% of the total amount of n-butyrate removed. After 13 days of continuous feeding, the material balance was consistent with the  $\beta$ -oxidation mechanism and the formation of iso-butyrate became negligible. N-butyrate decarboxylation may therefore be a transient catabolic pathway, although the reason why decarboxylation is preferred to  $\beta$ -oxidation under conditions such as sequential feeding is not clear. Results of similar experiments on acetate removal were consistent with theoretical expectations under conditions of both sequential and continuous feeding. (Author abstract) 18 refs.

**089706 REMOVAL OF ORGANICS FROM LEACHATE BY THE COMBINED PROCESS OF A FACULTATIVE PRE-TREATMENT POND AND AN AERATED LAGOON AT A SEA-BASED SOLID WASTE DISPOSAL SITE.** Leachate was collected from the sea-based North Port Solid Waste Disposal Site, Osaka City, and a bench-scale treatment of the combined process of a facultative pre-treatment pond and an aerated lagoon was applied for more than 120 days. The maximum BOD removal rate coefficient and COD-manganese removal rate coefficient were 0.090/day and 0.018/day, respectively. These values were obtained when the retention time of the facultative pre-treatment pond was 25 days. But, if the retention time was beyond or below 25 days, both removal rate coefficients were smaller. Therefore, we concluded that the optimum retention time of a facultative pre-treatment pond was 25 days. This was reconfirmed by the Gel-Permeation Chromatography of the treated leachate, a method for evaluating wastewater treatability proposed by Tambo and Kamei. Furthermore, the Gel-Permeation Chromatography pattern of the treated leachate in the bench-scale experiment coincided with that obtained by the actual field test. Additional study results are discussed. (Edited author abstract) 10 refs.

**089707 HOUSEHOLD HAZARDOUS WASTE: A DANGER TO THE PUBLIC?** This paper describes the household hazardous waste collection programs. Programs to collect household hazardous wastes generally have five goals: Increase public awareness of hazardous materials found in homes and their potential health and environmental impact; Educate residents as to the best methods of household hazardous waste disposal; Remove household hazardous wastes from homes, reducing exposure and potential injury; Reduce danger to refuse collectors and other sanitation workers; and Provide for proper disposal of household hazardous wastes. The survey by U.S. Environmental Protection Agency defines the hazardous municipal waste disposal methods.

**089708 ROUTING: CAREFUL Q&A IS CRITICAL.** There are a number of nationally marketed software packages for waste haulers (and many more on a regional level) that deal with certain aspects of routing. This article discusses various aspects to consider in evaluating and selecting routing packages. Subjects covered include database considerations, billing requirements, route information, driver reports, and others.

Hopper, Charlie (Nat'l Software Systems, Eau Claire, WI, USA). *World Wastes* v 30 n 11 Nov 1987 p 34.

**089709 SOLID WASTE MANAGEMENT IN INDONESIA: STATUS AND POTENTIAL.** The increasing arisings of municipal solid wastes constitute a serious environmental problem for the developing countries. Urbanisation has magnified the need for adequate solid waste disposal. This article examines the present situation of solid waste management in Indonesia in general and Jakarta in particular. The available disposal methods are presented and analyzed, while possible options to improve the overall management of wastes are discussed on the basis of the available technologies. These are evaluated in

terms of compatibility with the wastes produced in Indonesia. (Author abstract) 16 refs.

Maniatis, K. (Pusat Penelitian Dan Pengembangan Hasil Hutan, Bogor, Indones); Vanhille, S.; Martawijaya, A.; Buekens, A.; Verstraete, W. *Resour C. serv* v 15 n 4 Nov 1987 277-290.

**089710 WASTE MANAGEMENT SYSTEM IS COMPUTER CONTROLLED.** The article discusses computerization of the New York City sanitation system, which handles about 25,000 tpd of refuse. The problems to be solved include a wide assortment of different equipment added over the years, plus a computer system already under contract with which everything else must interface. The Department of Sanitation uses two basic methods to dispose of its refuse: incineration and landfilling. The system discussed involved devising and standardizing the system to weigh loaded refuse trucks at the city's landfills, incinerators, and marine transfer stations, capturing the data, and interfacing the data with the city's host computer.

Anon. *Public Works* v 118 n 11 Nov 1987 p 56-57.

**089711 MANAGING HAZWASTE WITHIN A MUNICIPAL WASTE SYSTEM.** Small Quantities of hazardous waste that used to be routinely accepted at sanitary landfills are now being given a 'second look' by municipal and private sector managers and regulators. These professionals are changing their operations to keep the waste out of the non-hazardous system, to protect workers, equipment and the environment, and to minimize future liabilities and costs. Under federal law, hazardous waste is solid waste that is on a regulatory list or exhibits one of the following four characteristics: Ignitability. The substance has a flash point of less than 140 degrees F, e.g. solvents, paint thinners. Reactivity. The substance reacts violently with water, gives off toxic vapors or fumes, or is explosive. Corrosivity. The substance is very acidic or caustic, e.g. sulfuric acid, sodium hydroxide. Toxicity. The substance releases any of eight metals or six pesticides in a prescribed test. Post-inventory procedures and the training of staff members are also discussed.

#### Processing

**089713 SYSTEM FOR PREPARATION AND PRODUCTION OF RDF (REFUSE DERIVED FUEL) FROM A SOURCE-SEPARATED FRACTIONATION OF MSW (MUNICIPAL SOLID WASTE) IN NARASHINO.** The RDF production system relates to the effective use of resources and to reduce landfill bulk, and consists of the following two subsystems: A pre-treatment subsystem, which recovers valuable resources such as iron, aluminium or glass from a source-separated fraction of MSW. An RDF production subsystem, which

produces RDF by processing combustibles such as paper and plastic, which are separated from raw wastes at the pre-treatment subsystem. The arrangement and features of this system are discussed.

Ishii, Yoshiaki (Ebara Corp, Tokyo, Jpn); Ishii, Noboru; Iida, Yuichi. *Conserv Recycling* v 10 n 4 1987 p 229-236.

**089714 TO SHRED, OR NOT TO SHRED?** Shredding of municipal waste prior to landfilling, which can conserve landfill space by eliminating the need for daily cover, may soon be a more widely considered strategy. Specialized shredders have been developed to handle materials ranging from wood to construction waste to steel-belted tires, helping in the recyclability of these waste materials. But municipal waste processing, not recycling, is the predominant reason for shredding. It is not a widespread application, however. Despite three decades of availability, municipal waste shredders are used by less than a dozen major facilities in North America. Experts differ sharply over shredding's costs and benefits. This article discusses advantages of shredding, European shredders, applications, and other aspects of the subject.

**Recycling** See Also PLASTICS—Recycling; PLASTICS—Waste Utilization; SEPARATORS—Magnetic.

**089715 TWIN CITIES BEGIN NEW ERA IN MANAGING AREA'S WASTES.** Most of the solid waste from the Twin Cities, Minnesota area is currently disposed in landfills, but by 1990 four-fifths of the region's waste will be processed at resource recovery plants. Instead of land disposal, most of this northern metropolitan area's wastewater will be recycled or used to produce energy. The Twin Cities' move away from landfills toward a solid waste system built on refuse-derived fuel and mass burn plants took 10 years of Minnesota State Legislature involvement. This article discusses what went into the decade of planning at the regional, county and city levels that was involved to work out the current system.

Reddick, Ken. *World Wastes* v 30 n 8 Aug 1987 p 39-40, 42.

**089716 COMPARATIVE EFFECTIVENESS OF REWARD AND COMMITMENT APPROACHES IN MOTIVATING COMMUNITY RECYCLING.** The relative effectiveness of commitment and incentive techniques in promoting newspaper recycling was compared. Some homeowners were asked to make a formal, signed commitment to recycle newspapers. Others received tokens exchangeable for back-up reinforcements of goods and services each time they recycled. A combined commitment plus token reinforcer group, and an untreated control group were also included. Following five treatment weeks, all the contingencies were removed during three follow-up weeks. Study results are discussed. The findings indicate that commitment techniques have considerable impact in motivating individuals to recycle and that they may be able to overcome some of the limitations often encountered by incentive-based programs in promoting resource conservation. (Edited author abstract) 35 refs.

Katzev, Richard D. (Reed Coll, Portland, OR, USA); Pardini, Anton U. *J Environ Syst* v 17 n 2 1987-88 p 93-113.

**089717 RECYCLING COMING OF AGE.** Recycling programs are taking off around the country, prompted by the solid-waste crisis and more sophisticated ways of handling and selling the materials. Some examples of recycling programs in the USA are given and a brief history of recycling is sketched. Rural recycling in Wilton, NH, and urban recycling in New Jersey and Massachusetts are discussed as indicating future trends.

Goldofas, Barbara. *Technol Rev* v 90 n 8 Nov-Dec 1987 p 28-35, 71.

**089718 TRANSFER STATION RECYCLES 100 TONS PER DAY.** California's Marin Resource Recovery Center receives over 350 tons per day of mixed waste,

diverting 30 percent for beneficial use. The \$9 million resource recovery facility is enclosed within a 130,000 square-foot-building, which combines both receiving and processing of waste from the public, and from roll-off debris box trucks. The facility has been designed to rely on sorters to recover several recyclable materials. In addition, the facility is capable of mechanically processing large loads of wood and yard waste. This article discusses various aspects of the facility, waste handling, and operational efficiency.

Southworth, Matthew J. (Cal Recovery Systems, Richmond, CA, USA); Diaz, Luis F. *BioCycle* v 28 n 10 Nov-Dec 1987 P 34-35.

**089719 7,500,000 PEOPLE, TWO LANDFILLS.** With nine of its remaining 11 landfills scheduled to close by mid-1988, New Jersey is gearing up to implement its mandatory source separation and recycling act. The framework for the actual recycling programs within the state with each county responsible for completing a district (i.e. county) recycling plant. The Recycling Act provides several approaches to stimulate the markets for the more than 1,750,000 tons of materials that will be available annually. The article discusses these subjects, along with program provisions for special materials, and financing.

Glenn, Jim. *BioCycle* v 28 n 10 Nov-Dec 1987 P 36-38.

**089720 THRIFTY YANKEES RECYCLE & SAVE.** With a capital investment of \$21,800 and a practical approach to design, Peterborough, New Hampshire, recycles 650 tons of refuse per year, which it claims is 45% of its solid waste. Sale of recyclables produces \$15,000 in revenue; and Peterborough taxpayers save another \$354,000 in avoided disposal costs. Recycling expenses in 1986 - \$29,440 - did not include the cost of disposal of non-recyclable refuse. This is baled and stacked in a sanitary balefill, located behind the recycling center and next to the town's old landfill. Part of the center's success stems from Peterborough's never having provided municipal waste collection. This article discusses recyclables, marketing, and other aspects of the program.

Grady, Julie C. *Waste Age* v 18 n 12 Dec 1987 p 39-40, 42.

**089721 CO-OPERATION WORKS IN VIRGINIA.** When the RDF plant in Portsmouth, Va., swings into full operation in January, it will become the centerpiece of perhaps the most complete solid waste disposal system in the United States. The plant is the work of the Southeastern Public Service Authority (SPSA), regional authority founded in 1973 by eight local governments that encompass nearly 2,000 square miles and a population of 950,000 people. As a result of its efforts, the area's ecosystem no longer handles pollutants from six sub-standard landfills, two old air-polluting refuse incinerators, and one obsolete military facility that burned an estimated 800,000 gallons of fossil fuel annually.

Masley, Ed. *Waste Age* v 18 n 12 Dec 1987 p 45-46, 50, 53.

**089722 WASTE RECOVERY IN EUROPE.** This is the first of a two-part article on European refuse processing. It presents a 'tour guide' to 12 European plants which extract recyclable materials from refuse. The article highlights both products and unit processes in Great Britain, France, Spain, Italy, Austria, Germany, the Netherlands and Sweden. Part One looks at the expectations for these plants, few of which had progressed much beyond shake-down at the time the original research was done.

Abert, James C. (Nat'l Soft Drink Assoc, Washington, DC, USA). *Waste Age* v 18 n 10 Oct 1987 p 65-66, 70-72.

**089723 RECYCLING'S FUTURE IS NOW.** The article discusses operations at the 150-acre landfill property owned by the city of Palo Alto, Calif. - home of one of the oldest and most comprehensive municipal recycling programs in the United States. Part of the operation includes a curbside program in addition to the drop-off

center. Subjects covered include collection operations, classification works, materials processing, markets, and others.

Salimando, Joe. *Waste Age* v 18 n 10 Oct 1987 p 75, 77-78, 80.

**089724 MORE ON EUROPEAN WASTE RECOVERY.** The article concludes a two-part series presenting a 'guide' to 12 European resource recovery plants, based on research done for the World Bank. It compares plant realizations with expectations builders had for them. Plant locations are in Germany, Austria, France, Italy, Sweden, the Netherlands and the U.K.

Abert, James C. (Nat'l Soft Drink Assoc, Washington, DC, USA). *Waste Age* v 18 n 11 Nov 1987 p 62-63, 66.

**089725 MATERIALS RECOVERY FACILITIES.** The first Materials Recovery Facility (MRF) was begun as a research and development project in 1975 by Resource Recovery Systems. In the early 1980s, the company launched the first full-scale MRF at Groton, Connecticut, and a publicly-owned-and-operated facility followed in Islip, New York. Since then, two additional plants started operating. At least five more facilities should be in operation by spring, 1988 in the U.S. This article discusses the need for MRFs, the technology, and ownership/operator arrangements.

Glenn, Jim. *BioCycle* v 29 n 1 Jan 1988 p 24-27.

**089726 RESOURCE RECOVERY PLANT NOT A HEALTH RISK.** The fear of cancer-causing compounds from the stacks of the world's largest mass burn, resource recovery facility was recently put to rest with a 120-page report presented to the Pinellas County Board of County Commissioners. This report summarized a detailed health risk assessment prepared by HDR Engineering, Inc., Tampa, Florida as part of the air emissions testing program conducted for Unit 3 of the Pinellas County Resource Recovery Facility. A simultaneous testing program for non-criteria pollutants was conducted under the joint efforts of the Florida Department of Environmental Regulations, Pinellas County, the California Air Resources Board, and Wheelabrator Environmental Systems Inc. The study and its findings are discussed.

Van Derman, Bob (Solid Waste Management, Pinellas County, FL, USA). *Public Works* v 119 n 3 Mar 1988 p 64-65.

**089727 WHAT A RISK ASSESSMENT IS - AND HOW IT CAN HELP IN SITING.** Increasingly, risk assessment plays an important role in resource recovery planning and policy-making. Yet often the purposes and potential of these analyses are not clear to those who commission them. Resource recovery facility planning and siting can be improved by decision-makers who understand the risk assessment process. This article discusses what risk assessments are and how they are accomplished. Subjects covered include emission estimates, environmental fate of pollutants, risk and health effects, and others.

Fontana, Perry H. (Woodward-Clyde Consultants, San Francisco, CA, USA). *Waste Age* v 19 n 4 Apr 1988 p 331-332, 334.

**089728 EVOLUTION OF THE INDIANAPOLIS RESOURCE RECOVERY FACILITY.** The article discusses the background and studies that led to the Indianapolis Resource Recovery Facility (IRRF), which is under construction and scheduled for commercial operation in early 1989. The IRRF will serve as the central disposal point for the consolidated City of Indianapolis and Marion County. It consists of three mass burn combustion units using the Martin Reverse-Reciprocating Stoker Grate. Each combustion unit will have the capacity to process 787.5 tpd of municipal refuse, converting each

ton of refuse into 4,500 lb of steam for Indianapolis Power and Light Co. These and other aspects of the subject are discussed.

Stevens, P.L.; Henderson, J.S.; Tulli, R.R.; Mills, G.A. *Public Works* v 119 n 6 May 1988 p 86-89.

**089729 COLLECTING & PROCESSING RECLAIMED MATERIALS.** The article, the second in a series, discusses considerations for the solid waste professional in making an intelligent choice among the many technological options for collecting, processing, and storing recycled materials. Subjects covered include initial planning considerations, specialized collection equipment, balers and shredders, and others.

Walsh, Patrick (Univ of Wisconsin-Madison, WI, USA); O'Leary, Phil. *Waste Age* v 19 n 2 Feb 1988 p 106-108, 110, 112.

**089730 MATERIALS RECOVERY SYSTEM FOR SOURCE-SEPARATED NONCOMBUSTIBLE RUBBISH AND BULKY WASTE IN NISHINOMIYA.** Since 1980, the city of Nishinomiya has been recovering materials from source-separated non-combustible and bulky waste to reduce the amount of final disposal. Materials amounting to 33-39% of the throughput are recovered in the Shredding and Separation Facility, which consists of a manual separation system, a mechanical separation system, a shredder, a pair of shears and incinerators. The facility system is shown in order of processing of the waste. The secondary pollution control, safety equipment, instrumentation, etc., are also described. The recovery percentage and use of revenues are explained in detail. (Author abstract)

Adachi, Yoshihiro (Water Disposal Dep, Nishinomiya, Jpn). *Conserv Recycling* v 10 n 4 1987 p 217-227.

**089731 WELL-EQUIPPED FACILITY RECYCLES WASHINGTON WASTES.** Washington state's largest solid waste recycling facility now is operating inside an 80,000-square-foot building formerly used for storing and cutting steel. The converted plant is operated by Rabanco Recycling Co. The south Seattle plant processes waste from the collection routes of Seattle Disposal, serving the south half of Seattle, and Rabanco's collection company in the city of Kent, south of Seattle, as well as from a new curbside recyclables collection program in south Seattle and curbside recycling demonstration projects involving several Rabanco-served suburban areas. The objective is to run the recycling plant at 500 to 600 tons per day. Subjects covered include specialized equipment, marketing, and others.

Johnson, Bruce (World Wastes, Atlanta, GA, USA). *World Wastes* v 31 n 7 Jul 1988 p 54-55,77.

**089732 CRYOGENIC COMMUNION IN SCRAP RECYCLING.** The technical basis and the pros and cons, including market and economic factors, of cryogenic communion in the processing of scrap metal, plastic and rubber are described. A serious deterrent to realization of the advantages to be gained by cryogenic communion is the high cost of liquid nitrogen and many commercial operations have failed because of this cost factor. (Author abstract). 41 Refs.

Daborn, G.R. (Dep of Trade and Industry, Stevenage, Engl); Derry, R. *Resour Conserv Recycl* v 1 n 1 Mar 1988 p 49-63.

**089733 RECYCLING IN GREECE.** The Association of Communities and Municipalities in the Attica Region (ACMAR) has constructed a mechanical separation and materials recovery pilot facility which has a capacity of 2 tons per hour (8 hours per day, 5 days per week). There will be a two-months test operation that will seek to optimize facility output. The elements that are under investigation are: Cleanness of the recovered materials; Materials marketability; Cost/benefit analysis for the possibility of the expansion of this disposal method in Greece. The capital cost reached 560,000 U.S. dollars, while the facility will be operated by a five member staff.

Frantzis, Ioannis (Assoc of Communities & Municipalities in the Attica Region). *BioCycle* v 29 n 6 Jul 1988 p 30-31.

**089734 HOUSEHOLD REFUSE RECYCLING IN FRANCE.** A regional plant located a few miles outside St. Brieu in the Chatelets region of France receives 25,000 tons per year of urban solid waste generated by the 20 townships composing the SICTOM. Initial treatment stage transforms the fermentable organics in the household refuse into high quality compost. This stage was commissioned in March, 1986. In June, the landfill was found insufficient for the disposal of the rejects, and an incineration plant was set up with a system to sell recovered heat to local industry. Rejects have now been reduced to about 10 percent by weight of incoming material.

Levasseur, J.P. (Omnium de Traitements et de Valorisation, Courbevoie, Fr). *BioCycle* v 29 n 6 Jul 1988 p 32-33.

**089735 RECYCLING TAKES THE LEAD.** NBCM has been involved in the development of recycling systems for several communities. These projects typically begin with an analysis of the amount and type of waste generated by the community. Once the approximate amount of recyclable material is known, potential purchasers in the secondary materials markets can be contacted to determine what local outlets exist. BCM enters this information into a multi-dimensional spreadsheet with an array of headings. This allows easy update and quick reference and provides the groundwork for a market sensitivity analysis. Several options for collecting recyclable material exist, including curbside collection by recycling crews, drop-off centers where residents are paid in cash for their recyclables.

Murray, Kevin (BCM Engineers, Plymouth Meeting, PA, USA). *Public Works* v 119 n 9 Aug 1988 p 52-53.

**089736 COUNTY LAUNCHES RECYCLING PROGRAM.** Mobilizing broad-based support - from political leaders, the private sector, and the leaders, the private sector, and the general public - was a critical ingredient to curbside recycling. Gaining political support for program concept eventually translated into budget allocations. Private industry, too, lent the county's recycling program invaluable technical expertise, experience, and financial contributions. The carefully designed implementation plan, with exhaustive data collection built into the first phase, will enable the county to proceed with designing the county-wide program, using the collection equipment, processing operations, and collections procedures found most effective. Extensive public education and promotion of the program also contributed to the success of the first phase of curbside recycling. Householders were aware of the program and how to participate.

Dorn, Betsy (Mecklenburg County Recycling, Charlotte, NC, USA). *Public Works* v 119 n 9 Aug 1988 p 63-66.

**089737 DEVELOPING A RECYCLING PROCESSING CENTER.** While markets for recyclable materials continue to develop, there will always be some materials that cannot be recycled because markets do not exist or technologies for reusing the materials do not exist. Landfills will always be needed. Some wastes are also better incinerated than recycled. This article covers recycling in conjunction with other techniques for managing wastes. Many communities are combining recycling programs with other waste processing technologies, as opposed to sending all nonrecyclable materials to a landfill. This multiprocess approach has become commonly known as "integrated waste management." Subjects covered include a systems approach to planning a recycling center, composting, process options, and others.

O'Leary, Philip (Univ of Wisconsin, Madison, WI, USA); Walsh, Patrick. *Waste Age* v 19 n 7 Jul 1988 p 100-102.

## Storage

**089738 DESIGN AND CONSTRUCTION OF A LARGE REFUSE SILO FOR MAXIMUM HEAT RECOVERY BY INCINERATION.** In Sapporo, a large

refuse silo was constructed at the Shinoro Incineration Plant, in order to store the paper and wooden fractions of refuse generated during summer and to burn them during winter for increased energy recovery. From this experience in designing, constructing and operating the silo, the following conclusions were made: (1) An efficient operation of incineration plants becomes practical throughout the year for cities like Sapporo where seasonal changes in refuse generation are greater, due to the local climate and other special conditions. (2) An increased heat recovery and use, meeting the highest demand of heat during winter, can be attained. (3) Economically, construction and operation of a refuse silo under the circumstances mentioned above can be very cost-effective. (4) Special cares and precautions for fire prevention are found necessary in operating a large storage silo for shredded refuse.

Hashimoto, Akio (Sapporo City Hall, Jpn); Iwamura, Shunji; Gotoh, Sukehiro. *Conserv Recycling* v 10 n 4 1987 p 209-216.

## Transfer Stations

**089739 SNAPSHOT OF SMALL TRANSFER STATION COSTS.** The article discusses four types of facilities and their capital, operational, and maintenance costs, based on the assumption that the unit is built in Massachusetts. Size range varies with population and type of community served: small: 5 tpd capacity, serving a residential community of 2,000-3,000 people; 20 tpd, serving a primarily residential community of 8,000-10,000 with typical commercial support facilities; 65 tpd, for approximately 25,000 people, serving a slightly higher level of commercial and industrial facilities within city limits; and 150 tpd, typically serving a community of 50,000 people with a moderate level of commercial/industrial development. Data are adjusted to May, 1987, cost indices.

Zuena, Anthony J. (SEA Consultants Inc, Cambridge, MA, USA). *Waste Age* v 18 n 12 Dec 1987 p 85-87.

**089740 SHREWSBURY TAMES TIME.** The article discusses how a small municipality got around long landfill lines by cutting round trips from four per day to one. Shrewsbury, NJ, did this by switching to a refuse transfer system designed especially for small communities. Thanks to the switch, the borough eliminated 12 weekly round trips to the landfill. The sanitation workforce was reduced from six men to two. The new system does not use a single bulldozer, transfer trailer, or building, and the public works yard serves as a 'mini' transfer station.

Anon. *Waste Age* v 18 n 12 Dec 1987 p 99, 102.

**089741 TRANSFORMATION OF A TRANSFER STATION.** New York City's Department of Sanitation (DOS) is performing architectural facelifts on older transfer units facilities - where refuse is moved from trucks to barges. One such project involves redesigning and updating a unique marine transfer station (MTS) in Manhattan. This station will transfer 3000 tons of refuse daily and serve as a 'model facility' that brings together the words of art, education, and sanitation. The MTS will educate the public about how the DOS copes with 25,000 tons of refuse generated daily by New Yorkers. An observation gallery's monitors will show all of the station's operations. Environmental video art and documentaries will also be shown.

Zarillo, Anthony (New York City's Dep of Sanitation); Foerster, Richard. *Waste Age* v 18 n 9 Sep 1987 p 39-40, 42.

**089742 NEW N.J. STATION MOVES LARGE VOLUME OF WASTES.** 442 Waste Management Inc. opened a \$4 million facility in Newark, New Jersey, to recycle materials and transfer the remaining waste out of state. The transfer station is among the largest of its kind in New Jersey and is said to be equipped with some of the latest, most efficient equipment. The time needed to process 10

tons of waste is only about seven minutes. This article discusses the transfer station equipment and operations.

Anon. *World Wastes* v 31 n 4 Apr 1988 p 118.

## Transportation

**089743 MOVING WASTES ON RAIL MAY HELP CONTAIN THE CRISIS.** As siting landfills near urban centers become virtually impossible, transportation becomes an increasingly important element of a refuse management plan. The idea of railroading wastes to distant disposal sites is not new, but increasing problems are driving some to reconsider this option. These and other aspects of the subject are discussed.

Adler, Cy A. *World Wastes* v 30 n 12 Dec 1987 p 20-21.

**089744 SHRINKING NORTHEAST FILLS FORCE LONG-DISTANCE HAULS.** Long-distance hauling of solid waste from cities in New York, Pennsylvania, New Jersey and other areas of the East coast started out as a cost issue. Recently, however, waste transportation has centered around the availability of a facility to burn, bury or otherwise handle the waste. No one wants the landfills, the waste-to-energy plants or the transfer stations. So old landfills close, new ones are discouraged, and the expansion of existing sites is resisted. The result is that garbage is hauled 400-500 miles or more from New York City to Ohio, or from Boston, Newark, Trenton and Philadelphia to upstate New York. This article discusses the issues involved, including the economics of it.

Voell, Paula; Voell, Anthony. *World Wastes* v 31 n 3 Mar 1988 p 32, 34.

**Waste Utilization** See Also BIOMASS—Energy Resources; FUELS—Refuse Derived Fuels; PLASTICS—Recycling.

**089745 MANAGING WASTE-TO-ENERGY: THE OPERATORS' PERSPECTIVE.** During this phase of the project, it is the responsibility of the plant or operations manager to assemble all the information needed to operate and maintain the plant. Although it is common practice for the supplier to furnish manuals containing guidelines, only the operations manager can review these manuals and develop procedures that reflect true operational procedures. Begin by designing a flow diagram and then numbering the equipment in sequence. Next, lay out the 'Equipment Spec Sheet'. This should be a one-page grid with information such as make, model, dimensions (overall and effective), main shaft and sprocket sizes, and speeds and angles of incline. In addition to the Equipment Spec Sheet, a second sheet should contain a brief explanation of the piece of equipment. Additional subjects covered include information categories, computerization considerations, and others.

Brunner, Kenneth C. *World Wastes* v 30 n 10 Oct 1987 p 22, 24.

**089746 MANAGING WASTE-TO-ENERGY: THE OPERATORS' PERSPECTIVE.** The article is the last in a 6-part series describing the operator's role in the development of a successful waste-to-energy project. It discusses various factors to consider and to deal with in developing an effective maintenance program, including analysis of tasks to be performed, review of lubrication requirements and lubricants, maintenance scheduling, and others.

Brunner, Kenneth C. *World Wastes* v 30 n 11 Nov 1987 p 27-28.

**089747 INTEGRATED RESOURCE RECOVERY SYSTEM.** This paper describes one combination of waste management subsystems based upon actual trials and experience. Recyclable materials are ferrous metal, glass, aluminum, plastics and paper fiber. Alternatively, the paper fiber and/or plastics also can be processed into a refuse-derived fuel. In the system, these various fractions are isolated along with a highly organic fraction suitable for composting alone or with sewage sludge. The integrated system provides for direct recovery of 60 percent of

the incoming solid waste stream in the form of recyclable secondary materials, along with the capability of increasing recovery to 80 percent using additional processing subsystems.

Diaz, Luis F. (Cal Recovery Systems, Richmond, CA, USA); Savage, George M.; Golueke, Clarence G. *BioCycle* v 28 n 10 Nov-Dec 1987 p 47-52.

**REFUSE INCINERATORS** See Also AIR POLLUTION—Gaseous Effluents; FUELS—Refuse Derived Fuels; HYDROCARBONS—Aromatic; JOINTS—Expansion; ORGANIC COMPOUNDS—Chemical Reactions; RADIOACTIVE WASTES—Disposal; REFUSE DISPOSAL—Analysis; REFUSE DISPOSAL—Florida; REFUSE DISPOSAL—Incineration; SEWAGE TREATMENT—Sludge Disposal; TURBOGENERATORS; WASTE DISPOSAL—Incineration; WASTE UTILIZATION.

**089748 STUDY OF THE BEHAVIOUR OF MUTAGENS IN WASTEWATER AND EMISSION GAS FROM A MUNICIPAL INCINERATOR EVALUATED BY MEANS OF THE AMES ASSAY.** We have investigated the mutagenic activity of extracts from the wastewater of sewage treatment plants in municipal waste incinerators and evaluated the relative contribution of various routes of emission from the incinerator to the total output of mutagens. The mutagenicity of wastewater extracts from a complete combustion incinerator was 10% of that from an incomplete combustion unit. About 90% of all the mutagens produced in a municipal incinerator are discharged into the atmosphere as emission gases, and 10% are disposed of in the wastewater treatment plants. Most of the mutagens in wastewater treatment plants are not decomposed by normal aeration times, but are removed by adsorption onto suspended solids. (Author abstract) 14 refs.

Kamiya, Akio (Gifu Pharmaceutical Univ, Gifu, Jpn); Ose, Youki. *Sci Total Environ* v 65 Sep 1987 p 109-120.

**089749 CATALYTIC EFFECTS OF FLY ASH FROM WASTE INCINERATION FACILITIES ON THE FORMATION AND DECOMPOSITION OF POLYCHLORINATED DIBENZO-P-DIOXINS AND POLYCHLORINATED DIBENZOFURANS.** The thermal behavior of polychlorinated dibenzo-p-dioxins (PCDD) and polychlorinated dibenzofurans (PCDF) on electrostatic precipitator ash (fly ash) from waste incinerators was studied at 300 °C under 'oxygen deficient' and 'oxygen surplus' conditions. On the basis of evidence presented, a mechanism for this fly ash catalyzed reaction is proposed, which starts with the formation of chlorine from metal chlorides and leads finally to a de novo synthesis of PCDD and PCDF. The findings reported will have consequences for the interpretation of PCDD/PCDF formation and decomposition in waste incineration facilities and will aid in minimizing PCDD and PCDF emission from such facilities. (Edited author abstract) 10 refs.

**089750 240 t/d WATER COOLED ROTARY COMBUSTOR MUNICIPAL REFUSE INCINERATION PLANT DELIVERED TO RYUSEN-EN (KUMIAI) PUBLIC COOPERATION.** The article describes the features of the IHI rotary combustor-type (RC) refuse incinerator which is capable of recovering energy with higher efficiency than other incinerators. Seven RC incinerators operate, proving its higher heat-recovery efficiency. A 240 t/d municipal refuse RC incineration plant (120 t/d x 2 units) recently delivered to Ryusen-en (Kumiai) Public Cooperation is equipped with a fully automatically controlled refuse crane, an automatic combustion control system, etc. (Edited author abstract) 4 refs.

**089751 RECENT FINDINGS ON THE FORMATION AND DECOMPOSITION OF PCDD/PCDF IN MUNICIPAL SOLID WASTE INCINERATION.** The

thermal formation of PCDD/PCDF in fly ashes of refuse incineration plants preferably in the low-temperature region of the boiler at 300°C is fully confirmed. Important parameters for the reaction of formation are the oxygen content and the water vapor in the offgas. Elemental carbon in the fly ash acts as an adsorbent to the precursor compounds. The oxidation of carbon may serve as a basis for the mechanism of PCDD/PCDF formation. Both reactions proceed by the Deacon process scheme. The catalytic action of CuCl<sub>2</sub> can be counteracted by the addition of NH<sub>3</sub>. (Author abstract) 11 refs.

**089752 COMPARISON OF AIR POLLUTION CONTROL SYSTEMS FOR MUNICIPAL SOLID WASTE INCINERATORS.** A major hurdle to be overcome by the proponents of municipal solid waste incineration is the popular misconception of uncontrollable and threatening air emissions of toxic pollutants from these plants. Flakt Canada Ltd has developed a dry adsorption system (DAS) with reactors, and quasi-dry or wet/dry lime slurry absorption systems with spray dryers (DRY-PAC) which achieve the high removal efficiencies required by the ever more restrictive environmental regulations. Results of acid gas removals range up to 98 percent for HCl and 95 percent for SO<sub>2</sub> as measured at commercial plants and over an extensive testing program at a pilot plant (summer of 1985) at the municipal incinerator in Quebec City, Canada. Organic removals for the toxic chlorinated dioxins and furans approach 99.9 percent plus under most fabric filter temperatures at the Quebec City pilot facility, while similar removal values are obtained at full-size installations in Europe. In evaluating the two systems, the completely dry injection system (DAS) has a capital and operating cost advantage for incinerators of 250-300 T/d of MSW. No difference was determined, however, in acid gas removal efficiencies for the two alternatives. 12 Refs.

## Combustion

**089753 STUDY OF CATALYTIC REDUCTION OF NO<sub>x</sub> IN FLUE GAS FROM A MUNICIPAL REFUSE INCINERATOR (EXPERIMENTAL RESULTS OF NO<sub>x</sub> REMOVAL TEST PLANT).** The catalytic reduction process of NO<sub>x</sub> by NH<sub>3</sub> has been applied mainly to the clean combustion flue gases of LPG or LNG, which do not contain the harmful component which reduces the catalyst activity. This paper describes the experimental results of a survey for the catalytic reduction removal of NO<sub>x</sub> from dirty gas containing higher concentrations of HCl, SO<sub>x</sub> and dust emitted from a municipal refuse incinerator. The effects of reaction temperature, space velocity and the amount of NH<sub>3</sub> injection on the NO<sub>x</sub> removal efficiency are studied experimentally, and the change of V<sub>2</sub>O<sub>5</sub>-TiO<sub>2</sub> catalyst performance with time is examined; and the regeneration techniques for catalysts are also discussed on the basis of the results of the heat treatment. (Author abstract) 8 refs.

## Computer Aided Analysis

**089754 INCINERATOR MODEL USES LOTUS.** This article describes one way to build a computerized model specifically designed for incinerators. If the model is built to cover a wide spectrum of incinerator applications, it can provide a consistent means of quickly comparing design configurations and operating conditions. A builder may write such a model in any computer language. The author built his model in the Lotus 1-2-3 spreadsheet.

## Control

**089755 REFUSE INCINERATOR OPERATION GUIDANCE EXPERT SYSTEM.** The refuse incinerator operation guidance expert system is a system which aids operation when the automatic combustion control system is difficult. By applying knowledge engineering, operation know-how of skilled operators is transferred to knowledge bases. The characteristics of this system lie in that the mutual interference between manipulators and states can be eliminated by a hierarchical structure of knowledge representation and a prediction method. The hierarchical structure of knowledge representation is also effective in the development of programs. (Edited author abstract) 11 refs.

**089756 CONTROL OF NKK-LIMAR (SEMI-DRY TYPE HCl REMOVAL SYSTEM).** In designing the control system for LIMAR (Semi-dry Type HCl Removal System), the generated HCl concentration was continuously measured in a dusty environment to determine the essential points that would make it possible to analyze the characteristics of the process. The measurements revealed that difficulties of controller design by large disturbances and process delay in operation of HCl analyzer. For this reason, a state predictor control system was adopted as the control system to resolve the problem of unreacted slaked lime. A feed forward control system with a capability of maintaining satisfactory controllability when variations occur in the slaked lime slurry concentration was developed. (Edited author abstract) 3 refs.

**089757 IMPROVED DESIGN AND OPERATIONAL PRACTICES FOR MUNICIPAL SLUDGE INCINERATORS.** Municipal sludge incinerators have experienced many design and operational problems. The Environmental Protection Agency (EPA) has sponsored a sludge incinerator study to identify the nature and extent of design and operational problems, to identify possible problem solutions, and to determine the technical applicability for use in municipal sludge treatment systems. Study results are documented in an EPA report and summarized in this paper. This paper describes process configurations and related equipment, operational characteristics, common problems and solutions, and design and operational considerations related to sludge incineration. 2 refs.

**089758 BUILDING UTILITIES DESIGN METHOD OF REFUSE INCINERATION PLANT.** Incineration plants are required to harmonize with an urban environment as well as have excellent efficiency. On the basis of this concept, this paper gives a design method for building utilities of a refuse incineration plant. It includes detailed ideas for designing a ventilation system for large and hot areas, a fire fighting system for a special building which is not covered by code of standards, and a heat recovering system which is an important factor for the planning of the incineration plant. ## Duluth, Minnesota

**089759 DULUTH RESURRECTS ITS CO-DISPOSAL PLANT.** A shredder explosion in 1982 at the co-disposal plant underlay a 6-year, \$5 million effort to redesign and retrofit the plant for safer, more efficient operation. The Western Lake Superior Sanitary District's (WLSSD) plant has become a source of pride for this Great Lakes community. Every working day, the plant turns 400 tons of solid waste into a fluff-like refuse-derived fuel (RDF) - which is used to burn sludge processed out of 34 million gallons of sewage. This article discusses studies that were conducted, process line equipment and other aspects of the subject.

**Emission** See Also FLUE GASES—Analysis.

**089760 PROBLEMS ASSOCIATED WITH THE MEASUREMENT OF PCDD AND PCDF EMISSIONS FROM WASTE INCINERATION PLANTS.** Fly ash and stack gases from municipal waste and industrial incinerators in the F.R.G. have been analyzed for dioxins (PCDD) and PCDF. Most of the currently used procedures of stack gas sampling for PCDD/PCDF have been compared and were found to be equally effective. Differences are found, however, in the recovery of surrogates added to the sampling train before sampling, which makes it difficult to validate the sampling procedure. Thirty samples of stack gas from a single (old) municipal waste incinerator showed wide variation in PCDD/PCDF emission, indicating that single measurements are not useful in characterizing a plant for average PCDD/PCDF emission. The variations found under steady conditions can be explained by the proposed mechanisms of PCDD/PCDF formation and decomposition at low temperatures catalyzed by fly ash. Incineration of hospital waste and pyrolytic reclamation of copper in cables and aluminium produced significant emission of PCDD/PCDF. (Edited author abstract) 26 refs.

Hagenmaier, Hanspaul (Univ of Tuebingen, Tuebingen, West Ger); Brunner, Hermann; Haag, Roland; Kraft, Michael; Luetzke, K. *Waste Manage Res* v 5 n 3 Sep 1987 p 239-250.

**089761 PCDD AND PCDF EMISSIONS AND POSSIBLE HEALTH EFFECTS: REPORT ON A WHO WORKING GROUP.** An international group of experts, convened by the WHO Regional Office for Europe, discussed the health risks of PCDD and PCDF emissions from the incineration of municipal sewage sludge (MSS) and municipal solid waste (MSW) at a meeting in Naples, Italy, held 17-21 March 1986. A detailed analysis of emission data has shown that old and badly operated incinerators will emit up to many thousand ng Nm<sup>-3</sup> of PCDD and PCDF, while most modern, highly controlled and carefully operated plants will emit them at a very low level. It is still not known what contribution municipal incinerator emissions make to the overall environmental load and, consequently, human exposure. For modern incineration plants this contribution was estimated to be in the range of about a tenth to a few percent of the total background daily body burden [assumed to be 1-5 pg of 2,3,7,8-TCDD (dioxin) equivalents per kilogram body-weight and day]. (Edited author abstract) 25 refs.

Suess, Michael J. (WHO, Copenhagen, Den). *Waste Manage Res* v 5 n 3 Sep 1987 p 257-268.

**089762 RISK FROM EXPOSURE TO POLYCHLORINATED DIBENZO-P-DIOXINS AND DIBENZOFURANS EMITTED FROM MUNICIPAL INCINERATORS.** Incineration of wastes seems to be one of the major sources of PCDDs and PCDFs (dioxins). 2,3,7,8-TCDD is one of the most toxic chemicals known and has been found to have teratogenic and carcinogenic activities in animals. A modification of the multistage model is utilized for extrapolating high-dose, two-year animal cancer bioassay data to estimate human cancer risk for long-term, low-dose human exposure. The upper limit of incremental cancer risk is  $3.3 \times 10^{-3}$  for a continuous

lifetime exposure to 1 pg m<sup>-3</sup> of TCDD in ambient air. With the exception of 2,3,7,8-TCDD and a mixture of 1,2,3,6,7,8- and 1,2,3,7,8,9-HxCDDs, the chronic toxicity data on the rest of the 75 PCDD and 135 PCDF congeners are badly deficient. In the absence of chronic bioassay data on other PCDDs and PCDFs, several TCDD equivalent approaches have been proposed for risk assessment on other congeners or mixtures. This paper compares the various approaches. (Edited author abstract) 72 refs.

Mukerjee, Debdas (US Environmental Protection Agency, Cincinnati, OH, USA); Cleverly, David H. *Waste Manage Res* v 5 n 3 Sep 1987 p 269-283.

**089763 OPTIMIZATION OF COMBUSTION CONDITIONS TO MINIMIZE DIOXIN EMISSIONS.** Polychlorinated dibenzo-p-dioxins (PCDD) and polychlorinated dibenzofurans (PCDF) may enter an incinerator with the waste, be created in poor combustion or form in post-combustion zones under certain conditions of temperature and oxygen. Tests of MSW burning plants shows a wide range of emission of PCDD and PCDF. Mixing effectiveness, tightness of control, moisture, furnace and post-furnace temperatures, and the use of lime and reduced temperatures for acid-gas control all have an effect on emissions of trace organics. Carbon monoxide (CO), oxygen, moisture and furnace temperature have been found to be closely related to PCDD/PCDF emissions. By control of temperature and/or oxygen, and the use of CO as an indicator, it is possible to find and maintain optimum combustion conditions so as to minimize dioxins and furans. Plants having acid-gas controls reduce emissions below those achieved by good combustion alone. (Edited author abstract) 25 refs.

Hasselriis, Floyd (Gershman, Brickner & Bratton Inc, Falls Church, VA, USA). *Waste Manage Res* v 5 n 3 Sep 1987 p 311-326.

**089764 ORIGIN AND HEALTH RISKS OF PCDD AND PCDF.** PCDD/PCDF are ubiquitous in the emissions of trash-burning incinerators. They are synthesized in the cooler parts of the incinerator, and emissions are not reduced by controlling combustion conditions. Estimates of maximum lifetime risks of PCDD/PCDF emissions range over two orders of magnitude from a minimum of one per million. This risk is greater than that which has triggered regulatory procedures against airborne carcinogens by U.S. EPA. Computations based on PCDD/PCDF in adipose tissue of a representative sample of the U.S. population indicate a national lifetime cancer risk of 330-1400 per million depending on the choice of equivalence methodology. In comparison, U.S. EPA has regulated environmental exposure to benzene based on a national lifetime cancer risk of 71.4. Because waste-burning incinerators contribute significantly to this risk, it is the authors' opinion that their PCDD/PCDF emissions should be reduced if U.S. EPA is to be consistent in its regulatory practice. (Author abstract) 62 refs.

Commoner, Barry (Queens Coll, Flushing, NY, USA); Shapiro, Karen; Webster, Thomas. *Waste Manage Res* v 5 n 3 Sep 1987 p 327-346.

**089765 TOTAL ORGANIC CARBON EMISSIONS FROM MUNICIPAL INCINERATORS.** Total carbon (TC), carbonate carbon (CC) and total organic carbon (TOC) were determined in bottom ash, filter dust and flue gas of Swiss municipal solid waste (MSW) incinerators. The highest TOC load was found in the bottom ash (2-3 g kg<sup>-1</sup> MSW), followed by the filter dust (0.1-1.0 g kg<sup>-1</sup> MSW) and the flue gas (0.05-0.3 g kg<sup>-1</sup> MSW). The composition and behaviour of the bulk of TOC in these products is not yet known. In order to minimize the risk of leaching organic substances as well as metals due to biological, chemical and physical reactions of the products

of incineration in a landfill, it is suggested the incineration process be optimized towards complete combustion. (Author abstract) 12 refs.

## Energy Conservation

**089766 CERAMIC FIBER LINED INCINERATION SYSTEM OF REGENERATIVE TYPE MEETS CLEAN AIR STANDARDS IN COGENERATIVE USE.** To help meet EPA clean air standards, Mannington Resilient Floors Div. of Mannington Mills, Inc., Salem, N.J., has installed a new regenerative fume incineration system. In addition to meeting these standards by burning volatile organic solvents which are released during the printing of resilient sheet vinyl flooring, the system allows the recycling of warm air for heating the building and thereby will save about \$58,000 per year in fuel costs. Furthermore, overall operating economy is achieved because this system is 95% efficient. The steel incinerator shell is lined with ceramic fiber modules, Manville Z-Blok refractory, which were chosen to withstand temperatures up to 2300°F (1260°C), as well as for their strength and abrasion-resistance.

Anon. *Ind Heat* v 55 n 4 Apr 1988 p 28.

**089767 CHARACTERISTICS OF INCINERATORS WITH HEAT RECOVERY CAPABILITY.** A wide range of equipment is available for incinerating wastes and recovering the heat released as useful energy. These heat recovery incinerators (HRIs) can be grouped into four categories: starved-air modular, rotary kiln, excess-air grate, and fluidized bed combustion. State-of-the-art HRI technology has been reviewed to update the military knowledge base. Findings represent data collected from approximately 30 manufacturers of this equipment through literature review, direct survey work, and information exchange with other facilities investigating this area. The different technologies and products available are compared and evaluated for potential application at military installations. (Edited author abstract).

## Energy Utilization

**089768 ENERGY RECOVERY FROM REFUSE INCINERATION.** This conference proceedings contains 7 papers discussing energy recovery aspects from refuse incineration. Operational performance of waste-to-energy plants and economic incentives for recovering energy from refuse are topics considered. The design, construction, and first five years' operation of a municipal waste incinerator with energy recovery are discussed. One paper describes the production of steam from the combustion of solid wastes, while another presents experience obtained with steam and power generation from municipal wastes. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 10761 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

Maltese, Paolo. *Mater Plast Elastomeri* n 2 Feb 1987 p 78-87.

**089770 CADMIUM AND LEAD CONTENT OF SUSPENDED PARTICULATE MATTER EMITTED FROM A U.K. REFUSE INCINERATOR.** Suspended particulate matter (SPM), sampled from the stack of a large refuse incinerator in the UK, contained markedly elevated levels of Cd (1600  $\mu\text{g g}^{-1}$ ) and Pb (3%). These values were similar to those previously reported for several other incinerators in Europe, but the Pb concentrations were lower than in the SPM from three American incinerators. Calculation of the metal concentration ratio SPM/fly ash for the UK incinerator revealed a three-fold enrichment of the two metals on the SPM. Similar ratios were obtained for several other European incinerators; this correspondence in metal partitioning was linked to the use of electrostatic precipitators in these facilities. The SPM metal data obtained in this study were used to estimate atmospheric emissions of 0.5 t Cd year<sup>-1</sup> and 11 t Pb year<sup>-1</sup> from the incinerator. These results are discussed in the paper. (Edited author abstract) 13 refs.

**089771 HOW PLANT OPERATORS CAN MINIMIZE EMISSIONS.** To attain the lowest achievable emission rate from such a facility, plant operators must be well-trained - in both furnace and emission control device operations. This article deals with operating practices that have been shown to help minimize various emissions. Subjects covered include metals and plastics refuse, battery recycling, stoker, grate and furnace operation, and others.

Clarke, Majorie (New York City Dep of Sanitation, New York, NY, USA). *Waste Age* v 18 n 12 Dec 1987 8p between p 156 and 170.

**089772 AIR POLLUTION CONTROL STATUS REPORT.** Public concern about potential health and environmental effects of emissions has accompanied the national trend to construction of refuse-to-energy plants in recent years. The need for refuse incineration and the manifestation of public concerns have stimulated researchers and government agencies worldwide to focus their attention on control of emissions from refuse-burning plants. This article presents the results of current research into various emissions control topics. Refuse-to-energy emissions control trends in five key areas, including equipment, plant design and operations, are covered in this first of a three-part series.

Clarke, Majorie (Dep of Sanitation, New York, NY, USA). *Waste Age* v 18 n 11 Nov 1987 10p between p 102 and 117.

**089773 WIRKSAMKEIT VON PRIMAER- UND SEKUNDAERMASSNAHMEN ZUR DIOXINMINDERUNG IN MUELLVERBRENNUNGSANLAGEN. [Effectiveness of Primary and Secondary Measures for the Reduction of Dioxin in Refuse Incineration Plants].** The concentration of polychlorinated organic compounds in fly ash can be much more effectively reduced by a simple thermal after-treatment of the fly ash than is possible by using combustion engineering measures. Concentration reductions of more than 95% have been attained. This paper reports on tests undertaken at the Stuttgart Refuse Incineration Plant with regard to the reduction of polychlorinated dibenzodioxins and polychlorinated dibenzofurans. (Edited author abstract) In German. 13 refs.

**089774 ENVIRONMENTAL LEVELS OF CADMIUM AND LEAD IN THE VICINITY OF A MAJOR REFUSE INCINERATOR.** This study examines whether the atmospheric release of Cd and Pb from a

refuse incinerator in London has caused contamination of the local environment. Sampling networks were established for street dusts, surface soils, vegetation and total deposit gauges in areas up to 5 km downwind and upwind from the incinerator. Measurements of Cd and Pb indicate there is neither a marked nor an extensive contamination by these metals in the downwind area. However, dust Cd values decreased with distance from the incinerator in this area and Cd deposition rates were higher than in the upwind area. Nevertheless, most Cd values obtained in the downwind area were similar to those previously reported for other parts of London while Pb values were often lower. Appreciable Cd contamination was found within the grounds of the incinerator, the values being about 4-50-fold higher than in either the upwind or downwind areas. The extent of Pb contamination in this small area was more limited, with values being about twice those found in the two study areas. Additional study results are discussed. (Edited author abstract) 27 refs.

Hutton, M. (King's Coll London, London, Engl); Wadge, A.; Milligan, P.J. *Atmos Environ* v 22 n 2 1988 p 411-416.

**089775 IS LEAD A BIG PROBLEM?** More than 12 million tons of lead are used each year in the U.S. When disposed, it has been thought, this material could pose a serious hazard to human health. But the facts, when studied, produced good news: very little of the nation's lead ends up in the municipal waste stream. If a 4,000-ton sample of refuse processed at the Resource Authority of Sumner County (RASCO) plant in Gallatin, Tenn., is typical, less than 3% of this lead ends up in the nation's refuse. This article discusses the subject in terms of operations and environmental testing results for RASCO, covering recycling, mercury and cadmium removal, the effect of burning on lead, and related topics.

Roos, Charles E. (Nat'l Recovery Technologies, Nashville, TN, USA). *Waste Age* v 19 n 2 Feb 1988 p 54-56.

**089776 RELATION BETWEEN TOXIC INPUTS AND DIOXIN AND FURAN OUTPUTS FOR MUNICIPAL-WASTE INCINERATORS (MWIs).** Using our simplified model for dioxin and furan production in MWIs, we have estimated the required changes in toxic inputs to produce n-fold increases in the outputs of toxic equivalents (TEs). Since waste inputs generally reside on the furnace grates for about 30 min, TE output-variations should be considered for time periods equal to or longer than about 30 min. With these long averaging times, the amounts of toxic-input augmentations required for 10-fold output increases in full-scale MWIs become unreasonably large, except for the deliberate use of MWIs as toxic-waste burners. With very clean MWIs, substantial toxic-waste incineration may be combined with burning of municipal wastes on a controlled basis. (Author abstract). 5 Refs.

Penner, S.S. (Univ of California, San Diego, CA, USA). *Energy (Oxford)* v 13 n 4 Apr 1988 p 389-391.

**089777 MODEL ANALYSIS OF METAL PARTITIONING IN A HAZARDOUS WASTE INCINERATION SYSTEMS.** The 1984 Amendments to the Solid Waste Act require that wastes listed under the Resource Conservation and Recovery Act (RCRA) be analyzed to assess the feasibility of further banning from land disposal. Incineration is expected to be used more often for disposing of either the banned wastes directly or the residues of various treatment processes. Incineration of hazardous wastes, municipal wastes and industrial sludges produces some extent of trace metals. This paper provides a preliminary model concept for analyzing metal partitioning during incineration. The paper concludes that a model for predicting metal partitioning phenomena is feasible and could reduce costs in conducting metal emission testing in the field. (Author abstract). 11 Refs.

Lee, C.C. (US EPA, Cincinnati, OH, USA). *JAPCA* v 38 n 7 Jul 1988 p 941-945.

**089778 COMPARATIVE GENETIC ACTIVITY OF SAMPLES COLLECTED FROM TWO DIFFERENT URBAN WASTE INCINERATORS.** The genotoxic activity of samples obtained from the urban incinerator of Florence was analyzed. The results were compared with those obtained with samples drawn from the urban Snamprogetti incinerator of Schio (Vicenza), where halogenated acids contained in the smoke are neutralized with lime wash in a salification column. Samples were tested using prokaryotic (*Salmonella typhimurium* TA98, TA100 and TA102 strains) and eukaryotic (*Saccharomyces cerevisiae*, D7 strain) microorganisms. The results point out a clear difference in the genotoxic activity of the samples drawn from the two urban waste incinerators examined. This can be due either to the different cycles of incineration or to the different composition of the urban wastes to be incinerated. However, the former hypothesis, i.e. the presence of a more complete purification cycle in the Schio incinerator, seems to be the most likely. 10.

#### Federal Republic of Germany

**089779 EMISSION OF TRACE ORGANICS FROM MUNICIPAL SOLID WASTE INCINERATORS - RATIONALE OF NATIONAL GUIDELINES IN THE FEDERAL REPUBLIC OF GERMANY.** In the Federal Republic of Germany a working party has developed recommendations for dealing with the dioxin problems posed by waste incineration. According to these recommendations limit values for dioxin emissions are neither necessary nor practical. However, from the point of view of preventive environmental protection, dioxin emissions should be further reduced as far as is possible with present-day technology. The TA Luft (Technical Instructions for Maintaining Air Quality) contains stipulations and advice on this. The most significant of the solid residues from waste incinerators are the filter ashes as they have a high dioxin content. The working party of Laender (states) has compiled a catalogue of recommendations for the disposal of filter ashes. The transport of solid residues from solid waste incinerators is controlled under the Abfallgesetz (Waste Act) and regulations passed in connection with this act and under the Gefahrgutverordnung Strasse - GGVS (Regulation on the transport of dangerous freight by road). (Edited author abstract) 9 refs.

#### Fluidized Bed

**089780 FLUID BED COMBUSTION: LESSONS LEARNED.** With increasing frequency, fluid bed combustion (FBC) is mentioned as the technology selected in new waste-to-energy plants. There has, however, been relatively little action. Despite this lack of experience with municipal waste, fluid bed combustion has a long history. It has been used successfully for over 25 years in sewage sludge combustion, industrial waste combustion, and, in recent years, in coal-fired boilers. Proponents say the technology can decrease emissions and reduce ash disposal problems. This article presents an overview of what has been accomplished, in real terms, in full-size commercial plants designed and built to burn MSW in fluid beds. Case histories are discussed for Lausanne, Switzerland; Franklin, Ohio; Thunder Bay, Ontario; and Duluth, Minnesota.

#### Kyoto, Japan

**089781 OUTLINE OF KYOTO SOUTH NO. 1 WASTE INCINERATION PLANT, 600 METRIC T/DAY CAPACITY.** The Kyoto South No. 1 Waste Incineration Plant was handed over to the city of Kyoto in November of 1986. This plant is equipped with many new technologies to satisfy such requirements as strict pollution control, waste heat utilization, resource recovery of waste, and automation of the plant. Plant equipment is described.

Teratsujii, Kazuhiro. *Nippon Kokan Tech Rep Overseas* n 51 Dec 1987 p 70-72.

#### Los Angeles, California

**089782 POLLUTANTS SAY 'UNCLE' AT COMMERCE PLANT.** The 350-tpd Commerce, Calif., refuse-to-energy plant is a mass-burn facility, built by the city of Commerce and the Los Angeles County Sanitation District. It has been found to have air emissions among the lowest of any operating plant. Overfire and underfire air, sucked in off the plant's roof, is supplied to a Foster Wheeler boiler; refuse is burned on Detroit Stoker grates. Air then is put through thermal de-NOx treatment (from Exxon) and a spray-dry scrubber and baghouse (from Research Cottrell) before being released. Continuous emissions monitors (from Lear Siegler) check air quality as it leaves the boiler (where ammonia and oxygen are monitored), and at the stack. Stack monitors measure six air components: oxygen, nitrogen oxide, carbon monoxide, carbon dioxide, water, and sulfur dioxide. These and other aspects of the plant equipment and operations are discussed in the article.

Salimando, Joe. *Waste Age* v 19 n 5 May 1988 p 77-78, 80, 82.

#### Materials

**089783 EXPERIENCE WITH NICKEL CONTAINING ALLOYS IN APPLICATIONS IN WASTE INCINERATORS.** A laboratory study was conducted of various nickel base alloys and some austenitic stainless steels in a mixed oxidant environment containing O<sub>2</sub>, N<sub>2</sub>, SO<sub>2</sub> and HCl at temperatures varying from 593 to 927°C (1100 to 1700°F). Field studies with nickel alloys in waste incinerators were also conducted. Upon completion of exposure, all specimens were weighed to allow for the calculation of the mass change per unit area. The specimens were then sectioned and metallographically mounted. The metal loss and depth of maximum attack were measured on the unetched mounts of selected test runs. Finally, these microstructures were examined by SEM and selected specimens were used to extract the surface scales for X-ray diffraction (XRD) by anodic dissolution in a 10% HCl-methanol mixture. Test results are presented. 3 refs.

Ganesan, P. (Inco Alloys Int Inc, Huntington, WV, USA); Smith, G.D. *Ind Heat* v 54 n 12 Dec 1987 p 18, 20, 22.

#### Refractory Materials

**089784 BASICS OF REFRACTORY.** Refractory protects refuse-to-energy plant components. Refractory is a material used to form a protective lining on the inner boiler tube walls; it protects the walls from the products of combustion. This article discusses refractory material and its importance in refuse-to-energy plant operation and maintenance. Subjects covered include early plant problems, types of refractory materials, installation, and others.

Johnson, Donald K. (Norton Co, Worcester, MA, USA). *Waste Age* v 18 n 11 Nov 1987 p 76-78, 80.

**Temperature Control** See GAS BURNERS—Performance.

**Testing** See Also AIR POLLUTION—Control.

**089785 HOW TO HANDLE ACCEPTANCE TESTING OF WASTE-TO-ENERGY PLANTS.** Two of the key guarantees provided when constructing a resource recovery or waste-to-energy plant are capacity and energy production. This article discusses the acceptance testing procedures necessary to verify that these guarantees have been met. Emphasis is given to the measurement of refuse Higher Heating Value (HHV) during tests and the effect of HHV on the final results.

Thomas, David (Ogden Martin Systems Inc). *Power Eng (Barrington Ill)* v 91 n 10 Oct 1987 p 34-37.

**Waste Disposal** See Also REFUSE DISPOSAL—Incineration; REFUSE DISPOSAL—Land Fill.

**089786 TREATMENT OF WASTE WATER FROM REFUSE INCINERATION PLANTS.** The waste-water purification systems used at the Bamberg waste incinerator are described as an example of how easily such critical waste water can be treated. Water from flue gas scrubbers and ash washing which contains mercury, heavy metals and salts is precipitated with lime and trimercaptotriazine (TMT15) in two stages to produce an effluent that meets the strong discharge standards of the F.R.G. (Author abstract) 12 refs.

Reimann, Dieter O. (Stadt & Landkreis Bamberg, Bamberg, West Ger). *Waste Manage Res* v 5 n 2 Jun 1987 p 147-157.

**Waste Heat Utilization** See Also COMBUSTION—Fluidized Beds; REFUSE DISPOSAL—Baltimore, Maryland; REFUSE DISPOSAL—Recycling.

**089787 AKRON RDF PLANT FINALLY HITS STRIDE.** Today, the Akron Recycle Energy Systems (RES) is receiving more than 900 tpd of municipal solid waste and tires. The plant is in the midst of the longest sustained period of uninterrupted service in its seven-year operating history. But the Akron RES has not always operated at this level. The facility has been beset with technical, financial, and safety problems throughout its troubled past. An explosion in December, 1984, capped the troubles; it killed three persons, injured others, and shut down the facility for 10 months. An important additional fact: with the addition of a \$1.1 million city subsidy, the plant's cost of operation is competitive with present landfill costs. This article discusses the plant revenue problems, explosions, changes in operating arrangements, waste processing, steam production, and other aspects of the subject.

Sowa, Linda A. (Akron, OH, USA); Spencer, David B. *Waste Age* v 18 n 10 Oct 1987 6p between p 127 and 135.

**089788 SAUGUS: PLANT AS 'UNIVERSITY'.** As the oldest operating commercial refuse-to-energy plant in the U.S., the 1,500-tpd Saugus RESCO is a milestone in the waste services industry. It is owned by Wheelabrator Environmental Systems, Inc. This plant is sometimes called the 'University of Resource Recovery', because of its operator training program, and because the Saugus RESCO operating history has spawned many improvements to subsequent plants. This forerunner of the modern generation of incinerators, after some major modifications, has been operating consistently and efficiently without a shutdown since October, 1975. This article discusses current operations at the plant, financing modifications, and other aspects of the subject.

Grady, Julie C. *Waste Age* v 18 n 11 Nov 1987 p 46-48.

**089789 CITY RDF PLANT STOPS BURNING CASH.** Citizens of Columbus, Ohio, were well ahead of their time in 1977 when they voted to build one of the nation's first and largest trash-burning power plants. When it was finally finished in 1983, the project was two years late - and \$70 million over budget. Also, the plant did not perform up to expectations. In its first year, the plant averaged 772 tpd, short of the 2,000-plus daily tons

for which it was designed. Three years later, things have changed. Thanks to the city's investment of \$12 million in the 'Big Fix' program, completed this year, the plant has finally achieved reliability in burning its intended daily capacity. Additional city investments are being made, as well as an annual subsidy of the plant's operating budget that tops \$10 million. This article discusses the background of the project, ash handbag system, fuel processing and feed, economics, and other aspects of the subject.

Todd, Gordon (R.W. Beck & Associates). *Waste Age* v 18 n 11 Nov 1987 p 50-52, 54, 58.

**089790 ARMY LEARNS, AND LEARNS.** The U.S. Army has purchased six small-scale refuse burning facilities in the past eight years. This article discusses what can go wrong in small-scale refuse-burning facility design, construction, operations, and maintenance. It is based on studies of the problems by the Energy Systems Division of the Construction Engineering Research Laboratory (CERL) of the U.S. Army Corps of Engineers.

Salimando, Joe. *Waste Age* v 18 n 11 Nov 1987 p 70-72, 74.

**089791 REGIONAL APPROACH WORKS.** The article discusses how cooperation in building refuse-to-energy plants in the Baltimore metropolitan area has thus far averted capacity problems. It traces the background of the problem in the area and how this led the Northeast Maryland Waste Disposal Authority, the participating subdivisions, representatives of the governor's office, and the Maryland Environmental Service to negotiate the Northeast Maryland Regional Solid Waste Management Agreement (the 'Regional Agreement'). The Agreement set forth priority activities and short- and long-range goals for solid waste management in the region through 1985. These and other aspects of the subject are discussed.

Gagliardo, Michael A. (Northeast Maryland Waste Disposal Authority, Baltimore, MD, USA). *Waste Age* v 18 n 11 Nov 1987 5p between p 81 and 90.

**089792 HAULERS GET INTO REFUSE-TO-ENERGY.** This article discusses the smaller waste service company's involvement in refuse-to-energy. The small band of hauling company executives who have developed projects or are trying to do so agree that a privately held, local waste company has some advantages over a larger competitor in bringing a refuse-to-energy plant from concept to reality. Company owners interviewed say that not all hauling company owners can break into this field, but if they have certain qualities they can develop a project that will work. The article explores these qualities by presenting case history applications that discuss companies in Connecticut, South Carolina, Maine, Georgia and New York.

Spleen, Tony (Waste Age, Washington, DC, USA). *Waste Age* v 18 n 11 Nov 1987 5p between 91 and 101.

**089793 MUNICIPAL WASTE-TO-ENERGY MARKETPLACE TO EXCEED \$20 BILLION DURING NEXT TEN YEARS.** In response to a waste disposal crisis in the United States, the municipal waste-to-energy (W-T-E) marketplace has rapidly emerged during the last decade. The driving force in this marketplace is the lack of adequate landfill space throughout the country. While the future for suppliers of W-T-E technology and equipment is bright, there is little doubt that this emerging marketplace will plateau in the coming years. Through the years, design enhancements and the development of new technologies resulted in more reliable and efficient plants. Increases in tipping fees, as well as a developing marketplace for electricity and steam sales also enhanced the economics of the waste-to-energy marketplace. In response to a shortage in landfill space, economically viable incineration technologies, and increasing markets for products (e.g. electricity, steam, and recyclable materials) the United States waste-to-energy marketplace has thrived. By the end of 1991, almost 200,000 tons per day of capacity will exist in the U.S.

Jacobs, Steve (Resource Marketing Internat). *Strategic*

*Plann Energy Manage* v 7 n 4 Spring 1988 p 54-57.

**089794 WASTE-TO-ENERGY WITH A FLORIDIAN FLAIR.** The Bay County Resource Management Center is a 38 million dollars, 510-tpd waste-to-energy plant situated near Panama City, Florida. Because of a high water table in the area, local haulers deposit loads on a tipping floor, where front-end loaders push the wastes on one of two vertical conveyers. These take the wastes up and into two combustors. The facility has one of the best air emissions and performance records of the new generation of refuse-burning facilities. Since its May 1, 1987, opening, the facility has achieved near-100 percent availability. Recent tests conducted by the Florida Department of Environmental Resources on the plant's particulates indicate prove that it's a good neighbor: the plant releases only 66 percent of the particulate emissions allowed by state regulation. This article discusses the background of how the plant came to be, planning aspects, plant equipment and operators, and other aspects of the subject.

Mattheis, Ann H. *Waste Age* v 19 n 7 Jul 1988 p 113-114.

## Wastes

**089795 INCINERATOR ASH SPARKS HEATED DEBATE ON TOXICITY.** The question of ash toxicity was never fully examined by the industry or EPA until March 9, 1987, when the Environmental Defense Fund (EDF) announced the results of a study on ash from 30 resource recovery plants around the U.S. EDF noted that the levels of lead and cadmium were partially high in the ash. The group obtained its data from EPA ash tests from old and new, mass-burn and refuse-derived fuel facilities throughout the country. EPA has circulated a draft document spelling out proper sampling procedures and tests for determining ash toxicity. The design of EPA's ash sampling plan involves two components: one, to determine the average property of the waste; and, second, to determine if the wastes change over time. These and other aspects of the subject are discussed.

Darcey, Susan (World Wastes, Atlanta, GA, USA). *World Wastes* v 30 n 10 Oct 1987 p 32, 34, 36.

**089796 LEACHING OF TOXIC METALS FROM INCINERATOR ASHES.** The RCRA Extraction Procedure (EP) is a laboratory test intended to characterize the leaching of a waste codisposed in municipal, landfill waste. The purpose of this research was to fully characterize the leaching properties of some resource recovery ashes. To do this, four resource recovery ashes were leached under field conditions simulating monodisposal and codisposal practices. Monodisposal, as referred to here, is disposal of a resource recovery ash in a separate landfill, and codisposal means disposal of the ash in a landfill where untreated municipal wastes are also disposed. The leaching characteristics of the four ashes were also compared using four laboratory waste extraction tests. 14 refs.

Francis, C.W.; White, G.H. *J Water Pollut Control Fed* v 59 n 11 Nov 1987 p 979-986.

**089797 CONFUSION AND QUESTIONS ABOUT ASH.** The Environmental Defense Fund recently alleged that most ash residues from refuse-to-energy facilities will fail the U.S. EPA test which determines whether a given substance is a hazardous waste because of its characteristics. Public supporters of this technology, local officials, and the financial community have been questioning the validity of using waste-to-energy facilities as an environmentally safe disposal option for municipal solid waste (MSW). This article presents some of the known facts concerning incinerator ash, testing methodologies, and disposal options. Subjects covered include ash residue characteristics, refuse and ash testing, disposal options, and others.

Repa, Edward (Nat'l Solid Wastes Management Assoc). *Waste Age* v 18 n 9 Sep 1987 p 89-90, 92, 183.

**089798 ABSENCE OF ASBESTOS IN MUNICIPAL SEWAGE SLUDGE ASHES.** In earlier studies, asbestos

was found in sewage sludges in several cities in the United States using x-ray diffraction, high power light optical microscopy, polarized light, microscopy or electron microscopy. In a number of cities in the United States, sewage sludge is incinerated at temperatures up to 1000°C. Temperatures of 550°C or higher dehydroxylate the asbestos lattice resulting in alteration or even destruction of the mineral (EPA 1982). Since refractive index and other key parameters used to identify asbestos minerals change above 550°C it was of interest to analyze for the presence of asbestos in typically produced municipal sludge ashes. In the work reported here, sewage sludge ashes from 10 American cities were obtained and analyzed for the presence of asbestos. 5 refs.

**089799 OPTIMIZED GRAVITY MODELS FOR COMMODITY TRANSPORTATION.** This study is based on a comprehensive commodity flow survey done in Alberta in 1977, which covered the full range of commodity flows by different modes of transportation. The survey data is grouped into specific commodity categories and a set of O-D tables has been developed. The O-D tables are the basis for the development of gravity models for commodity flows. A set of gravity models, one of each commodity category, has been developed to represent the commodity flows on a province-wide basis. The gravity model for each category has been calibrated by an optimization technique that uses a power function and regression analysis. The calibrated gravity model is termed the 'optimized gravity model' to indicate the new technique of calibration. The developed models are acceptable as shown by statistical measures and commodity haul frequency diagrams. (Author abstract) 8 refs.

**089800 TRANSPORTATION ELEMENTS OF ENVIRONMENTAL IMPACT ASSESSMENTS AND REPORTS.** During 1986 ITE sponsored five seminars in various parts of the United States on the subject of Site Impact Traffic Evaluation (SITE). In conjunction with these seminars, local instructors conducted a survey of the cities and counties in each region where a seminar was conducted, and in selected other cities. ITE Committee 6Y-36 was requested to summarize the results of this survey to serve as a reference for those who are involved in creating or updating requirements for impact studies. The summary is presented. The survey addressed seven issues: The existence of guideline documentation; The enforcement of study requirements; When a study is required; The definition of scope of the study; Trip generation methodology requirements; Trip distribution and assignment technique required and Capacity analysis methodology and criteria. 1 ref.

## Communication Systems

**089801 SPATIAL DISTRIBUTION OF TELEMATICS: MODELING AND EMPIRICAL EVIDENCE.** In this paper we deal with the spatial distribution of telematics (a conflation of telecommunication and informatics) and the regional characteristics influencing it. We are interested in this topic because basically telematics could essentially alter the regional structure. Therefore, in the first section we construe a simple cost-minimizing model in order to derive factors impacting on the telematics endowment of a region. In the next section the hypotheses derived from this model are completed by

sociological determinants of the regional telematics equipment. In the second part of the paper we test our hypothesis with the aid of an economic study and of a questionnaire study. The sample is confined to two telematic tools, namely telefax and teletex, and geographically to the German state of Bavaria. (Edited author abstract) 22 refs.

## Computer Applications

**089802 TRACKING LAND SUPPLY FOR GROWTH MANAGEMENT.** Accurate land supply information often is the missing link in growth management programs. Properly designed computerized land record systems can perform a vital role by continuously tracking the changing attributes of vacant land supply. With this form of decision support, growth policies need not contribute to land and housing price inflation through overconstraining land supply. A national study of land supply monitoring systems documents their current status and emerging potential, and offers guidelines on overcoming both technical and institutional pitfalls involved in the initiation and use of such systems. (Author abstract) 33 refs.

**089805 EDUCATION FOR INTERNATIONAL DEVELOPMENT PLANNING: AN APPROPRIATE MISSION FOR WESTERN UNIVERSITIES?** There have been dramatic increases in the numbers of students from developing nations in planning and architectural programs in American universities. This trend raises serious questions about the appropriateness of such programs to the professional capabilities required for practice in developing countries. The ideal nature of academic programs designed to meet these needs is discussed in relation to existing programs both in 'the west' and in

developing nations. An experimental program at the University of Cincinnati is described as one potential solution to the problem. (Author abstract)

**089809 MULTIPURPOSE LAND INFORMATION SYSTEMS: TECHNICAL, ECONOMIC, AND INSTI-**

**TUTIONAL ISSUES.** Advances in computer, surveying, and mapping technology have had a marked impact on the economic barriers to multipurpose land information systems. This has opened the way for institutional innovations that may help to achieve the data sharing and spatial registration objectives identified in the 1980 National Research Council report on multipurpose cadastre. This paper explores the application of geographic information systems technology to build multipurpose land information systems as a means of dealing with the land records modernization problem. (Author abstract) Refs.

Ducker, Kenneth J. (Portland State Univ, Portland, OR, USA). *Photogramm Eng Remote Sens* v 53 n 10 Oct 1987 p 1361-1365.

**089810 RESULTS OF THE DANE COUNTY LAND RECORDS PROJECT.** This paper presents the results of the Dane County Land Records Project, a four-year research venture involving numerous local, state, and federal agency cooperators. The project has developed, tested, and evaluated a concept for a multipurpose land information system. Components of this concept have included reliance on individual data layers maintained by legislatively mandated agencies and a common mathematical reference system to permit integration of the layers. The project investigated means to improve data input efficiency through scanners, satellite geopositioning, and remote sensing imagery. The project also investigated means to improve interdisciplinary and interagency efforts, using cooperative agreements, weekly project meetings, and user training. (Edited author abstract) Refs.

Niemann, Bernard J. Jr. (Univ of Wisconsin-Madison, Madison, WI, USA); Sullivan, Jerome G.; Ventura, Stephen J.; Chrisman, Nicholas R.; Vonderohe, Alan P.; Mezera, David F.; Moyer, D. David. *Photogramm Eng Remote Sens* v 53 n 10 Oct 1987 p 1371-1378.

**089811 URBANIZATION AND LANDSAT MSS ALBEDO CHANGE IN THE WINDSOR-QUEBEC CORRIDOR SINCE 1972.** Quantitative determination of anthropogenic land use change from space observations has been carried out by comparing urban area expansion in the Montreal, Ottawa and Quebec regions, three representative centres of the economic heartland of the Windsor-Quebec corridor in eastern Canada. Land use monitoring using Landsat satellite data shows a marked process of utilization since 1972 (Montreal: + 70 per cent, Quebec: + 40 per cent and Ottawa: + 11 per cent). The total amount of rural and forest land converted to urban use is estimated. The induced mean ground Multispectral Scanner (MSS) albedo decrease, computed from the corrected satellite reflectance, is in the order of -0.001 to -0.005. This impact of urbanization is inferred to be similar over south-eastern Canada, using statistical data from governmental agencies. This change could be large enough to affect the regional climate since trends of past urban growth rates and extrapolation of the present rate to the end of the century are significant. (Author abstract) 30 refs.

Royer, Alain (Univ de Sherbrooke, Sherbrooke, Que, Can); Charbonneau, Lise; Bonn, Ferdinand. *Int J Remote Sens* v 9 n 3 Mar 1988 p 555-566.

**089812 LINEAR VILLAGES COULD REVIVE THE RAILWAYS.** With the relaxation of planning regulations, and a new emphasis on alternative uses for redundant agricultural land, local authorities will be under pressure to develop new criteria for allowing developments to take place. This can be done, during the necessary re-drawing of strategic planning maps, by using rural railway lines, which in some cases are suffering a decline, as a focus for the development of linear villages where no one lives more than 10 minute walk from the station, and enabling these lines to play a fuller part in providing rural public transport.

Harris, Peter. *Surveyor (Sutton Engl)* v 168 n 4967 Oct 22 1987 p 16-19.

Legislation See ROADS AND STREETS—Design.

## Public Policy

**089813 COMMUNITY ENERGY PLANNING: WINDS OF CHANGE FROM THE SAN GORGONIO PASS.** The electric power industry is changing in significant ways, but local planners have not yet clearly articulated their role in guiding the changes. This article seeks to clarify that role by reporting and interpreting what happened in Palm Springs, California, when local planners confronted intense pressure to help foster development of wind energy. Instead of guiding the change local planners impeded development. They were locked in to traditional ways of thinking and responding to the situation, which precluded them from exploring innovative alternatives. (Author abstract) 41 refs.

Recreational Facilities See Also HIGHWAY SYSTEMS—Construction.

**089814 FADD-DOMBORI UDOLTERULET. [Report-Area of Fadd-Dombori].** Between the village of Gerjen and the outlet of the Sio River two dead-channels are found on the right bank of the Danube River. They are the dead-channels of Fadd and of Tolna. The hydrographical and hydrometeorological features of the area are favourable for recreation. Especially, at the dead-channel of Fadd-with a water surface of 1 to 8 km<sup>2</sup>, and with a storage capacity of 6.6 million m<sup>3</sup> at the highest permitted water level-where a considerable vacationing area came recently into being suitable for a simultaneous recreation of several thousand people. The water supply of the area is satisfactory but canalization does not exist. The water regime of the dead-channel of Fadd is determined primarily by the position of the groundwater table, and secondly by the amount of precipitation. In the water stage time-series of the dead-channel of Fadd some characteristic fluctuations could be observed. The regime is characterized by the high-waters in spring and early summer, and by lows around the end of autumn. For the improvement of the water quality in the dead-channel of Fadd total canalization and wastewater treatment would be needed beyond temporary partial solutions. (Edited author abstract) 4 refs. In Hungarian.

Bratan, Maria (Kozep-dunantuli Vizugyi Igazgatóság, Szekesfehervar, Hung). *Vizugyi Kozl* v 29 n 2 1987 p 275-285.

**089815 HARBOR REVIVED.** In Racine Wis., a harbor rehabilitation turns a defunct commercial harbor into a money making playground. Every year, 85 different ethnic groups hold their own festivals in Racine. A site on the southwestern shore of the harbor was selected and the festival park planning began. With plans for the shoreline development underway, the redevelopment plan was soon expanded to include the harbor water itself. With the decision to turn the harbor into a recreational boaters' sanctuary, Warzyn Engineering Inc., Madison, Wis. was brought in to plan a 900-1,000 slip, full-service marina and conduct the hydrographic, topographic and geotechnical surveys necessary for the planning process.

Ryan, Larry W. *Civ Eng (New York)* v 57 n 9 Sep 1987 p 44-46.

**089816 OCCURRENCE OF ROTAVIRUSES AND ENTEROVIRUSES IN RECREATIONAL WATERS OF OAK CREEK, ARIZONA.** Recent epidemiological studies have shown a relationship between swimming in recreational waters meeting bacteriological standards and gastroenteritis with a suggested viral etiology. No previous studies have been conducted in the United States on the occurrence of human pathogenic enteric viruses in freshwater recreational areas. The presence of enteroviruses and rotaviruses was investigated in Oak Creek, Arizona, a heavily used recreational area. Water samples were filtered through positively charged filters, eluted with beef extract, and assayed for human enteroviruses and rotaviruses. Eighteen of the 41 recreational water samples

were positive for enterovirus or rotavirus. Of these, nine samples exceeded the Arizona State recommended limit of 1 PFU 40 l<sup>-1</sup> for full body contact in effluent dominated recreational waters. Several virus positive samples met the recommended fecal coliform standards (200 CFU 100 ml<sup>-1</sup>) for recreational waters indicating the inadequacy of bacterial standards for monitoring viral water quality. (Edited author abstract) 32 refs.

**089817 PECS' CASE, HUNGARY.** The Pecs' report is a team work between a Hungarian community planning researcher and a planner. Their case study report is based on work carried out within the IRC (International Researchers Cooperation) and on a seminar on Pecs. The town of Pecs, which has a population of 174,000 is the central place of the Baranya region and constitutes an integral part of the economic structure of the region. The emphasis is laid on the connection between national policy and local development, and more on the regional than on the local level. The strength of the Pecs Report lies in its description of how conditions for planning and planning policy is stagnating. The overall pattern is the same as in countries with free-market economies, that is to say it includes the centralization of decision-making and responsibility, deregulation and democratic trends in combination with declining economic resources for local agencies. 51 refs.

**089818 COMPILING DESIGN STANDARDS FOR DEVELOPMENT REVIEW.** Metropolitan area transportation plans and planning processes have been in existence in most areas for well over 20 years. Many local government agencies charged with street and road planning responsibilities do not have a comprehensive set of design standards for development review. To develop a comprehensive manual of design standards, it is recommended that the following procedures be followed: 1. Review and update all existing standards. 2. Review and include or reference ordinances and codes pertaining to development. 3. Review and include state standards where appropriate or relevant. 4. Review and include standards developed and adopted by other local agencies where appropriate. 5. Review nationally recognized publications from the American Association of State Highway and Transportation Officials, the Institute of Transportation Engineers, the Federal Highway Administration, and others. Proposed standards should conform with nationally accepted standards.

Stewart, Bret; Lalani, Nazir. *ITE J* v 58 n 1 Jan 1988 p 37-39.

**089819 INTERCITY TRANSPORTATION DEVELOPMENTS IN TAIWAN, R.O.C.: AN OVERVIEW.** Over the past three decades, Taiwan, Republic of China, as a developing country, has consistently given priority to the development of its transportation system. During the 1970s, when the government implemented the highly successful Ten Major Construction Projects, one-half of the projects were directly related to transportation development. Today the Taiwanese government is proceeding on the Fourteen Important Economic Development Projects, four of which are directly related to transportation development. This article covers intercity transportation in Taiwan. In doing so, it discusses Taiwan's economic development, describes the existing transportation system, and outlines planned development.

Chang, Chia-Juch. *ITE J* v 58 n 4 Apr 1988 p 27-32.

**089820 VANCOUVER REGIONAL TRANSIT SYSTEM.** Transit services in Vancouver are provided as a partnership between the provincial government and local municipalities in the Vancouver area. BC Transit, a provincial crown corporation, is responsible for planning and funding transit services throughout British Columbia. The Vancouver network consists of diesel and trolley bus routes, the SkyTrain rail rapid transit system, and the unique SeaBus ferry service - all of which link 16 municipalities in the Vancouver area into one fully integrated transit system. This paper describes the Vancouver regional transportation network.

Glover, Bob (BC Transit, BC, Can). *ITE J* v 58 n 5 May 1988 p 19-22.

**089821 MATERIAL NEEDS.** One of the first significant trunk road schemes of the post-war period built to eliminate a nationally known bottleneck on the A30 through the region, was that of the Honiton Bypass, a trunk road scheme of the 1960s. This project was subsequently followed by further trunk road schemes and county programmes in the 1960s and 1970s, culminating in the extension of M5 westwards from Bristol to Exeter. In the 1980s a further major programme of trunk road contracts and county schemes have been completed or remain under construction. This paper identifies the scale, timing and geographical impact of the trunk road programme of the 1980s on the provision of construction materials. The paper also considers those factors that influenced ECC Quarries in their decision on how to prepare for the impending construction programme and in particular how to source the materials and service the North Devon Link 2A Contract, Tiverton to South Molton. (Edited author abstract)

## United States

**089822 REGIONAL DEVELOPMENT, PLANNING AND HOUSING IN THE UNITED STATES: A CASE STUDY, ANDERSON TOWNSHIP, OHIO.** The terms regional development and regional planning are closely related to the strong suburban movement which is the most salient broad characteristic of housing development in the U.S. This movement, however, is the fourth major demographic phase in national growth, and has roots in the earlier three. One community, Anderson Township, is studied as a rather typical unincorporated area linked to a large city, Cincinnati. Its growth patterns, successes and failures at planning, and social and economic influences, offer insights to the dynamics of the American housing marketplace. (Author abstract)

Dorsey, Robert W. (Univ of Cincinnati, Cincinnati, OH, USA). *Int J Hous Sci Appl* v 11 n 4 1987 p 313-324.

Water Supply See Also GEOLOGY—Hydrology; WATER RESOURCES—Planning.

**089823 AUGMENTATION OF WATER SUPPLY FOR JAMNAGAR CITY.** Gujarat Water Supply and Sewerage Board (GWSSB) has been implementing water supply and sewerage projects in the Gujarat State (estimated cost, Rs. 120.62 crores). The project includes 5 urban water supply schemes, 4 sewerage schemes, 7 regional rural water supply schemes (255 villages) and 111 individual rural water supply schemes. Of the urban water supply schemes, Jamnagar Water Supply Scheme (Source: Und-Dam-I), estimated to cost Rs. 858.80 lacs will bring additional water supply of 25 mld. to the city. GWSSB is executing the project on behalf of Jamnagar Municipal Corporation (JMC).

**089824 PIPE DREAMS.** With new and improved pipes on the market and others, such as cast gray-iron, going out of style, finding the right pipe to supply city and

county residents with drinking water may become difficult and complicated. Most localities find it necessary to use a variety of water-transmission pipes for different areas due to varying soil and terrain conditions, even over a small geographic area. Different kinds of pipes include concrete-pressure, ductile-iron, PVC and welded-steel.

Darnell, Tim (American City & County, Alpharetta, GA). *Am City Cty* v 102 n 9 Sep 1987 p 56-58, 60.

**089825 BLASHFORD LAKES: SUPPLYING WATER INTO THE NEXT CENTURY.** A novel scheme by Wessex Water Authority is steadily taking shape near Ringwood in Dorset and parts of Hampshire, designed to safeguard the region's water supply into the next century. The Blashford Lakes project, which will eventually hold over 3000 megalitres of water, is made possible by an area of gravel pits just to the north of Ringwood. Gravel extraction has been taking place here since before World War II, and some pits are still being worked. As the water table is only about 2m down, gravel working below this level has resulted in the natural formation of several lakes. These lakes, plus others being created as gravel extraction continues, form the basis of an ambitious water storage and treatment complex linked to the area's distribution system, which will supply treated water as and when needed.

Buttfield, Anne. *Civ Eng (London)* Aug 1987 p 47-49.

**089826 SYNTHESSE VON FUNKTION UND GESTALTUNG: DAS WASSE WERK MOERS-GERDT.** [Synthesis Between Function and Design]. In order to secure the water supply to private households and industry in the Wesel-Krefeld-Moenchengladbach region and the adjacent territories on the left banks of the Rhine, the ground water reserves in the fields of Binsheim, Ginderich and Wardt-Moermtter will be utilised by being extended step by step. The reserves amount to approximately 140 mio m<sup>3</sup>/100 m<sup>2</sup>. The Moers-Gerdt water works built as part of the development project is an example of long-term planning and step-by-step development for drinking water supply. An expansion to six times the capacity is planned and has been taken into account during construction. The water works is an example of an excellent synthesis between operational functions with practical engineering and structural design which considers the environment and the ergonomics of the workplace. **089827 CATALYST FOR REGIONALIZATION OF RURAL WATER SYSTEMS.** A computerized hydraulic data management program (CHDMP) was developed for a case study in Nelson County, Kentucky. University professors, graduate students, and two water utilities' staffs cooperated in network analysis employing computer hardware and software. The utilities' staffs were taught the science and technology of hydraulic model preparation, simulation, and analysis for the case study distribution systems. As an integrated system, the model contained 294 pipes, 234 nodes, six pumps, and 11 tanks. Each utility's problem areas were identified and some of the individual and mutual benefits of hydraulic planning were illustrated. A dialogue resulted between the managers. **089830 INVARIANT AND CONTRACTED ACTIONS OF A PHYSICAL SYSTEM IN THE GENERAL THEORY OF RELATIVITY.** A study was made of the difference between the invariant action  $S_R$  and the contracted action  $S_G$  for the global problem: an isolated physical system as a whole. The actions are considered as functions of the upper limit; in the center-of-mass system their difference is distinct from zero (10). In an example from Newtonian mechanics this is shown to be related to the fact that the invariant Lagrangian contains second derivatives. The formulas for the energy-momentum vector as an action gradient and their quantum generalizations are valid only for the contracted action. (Author abstract) 14 refs.

**089831 RELAXATION OF METASTABLE ATOMS IN THE INTERPULSE PERIOD IN A REPETITIVE PULSE LASER ON SELF-LIMITED TRANSITIONS.** The effect of the parameters of the probing radiation on resonance-adsorption measurements of the concentrations of metastable atoms in lasers based on self-limited transitions is analyzed. It is established that the effect of transillumination of the medium by the probing radiation on the measurements can be reduced substantially by reducing time pulse duration of the sounding radiation. Analysis of the relaxation of the plasma parameters in the interpulse period in a bismuth-vapor laser established that in pulsed lasers based on self-limited transitions the behavior of the concentration of metastable atoms as a function of time is determined not only by the relaxation of the electron temperature, but also by the restoration of the concentration of atoms in the ground state. (Author abstract) 12 refs.

**Analysis** See Also SOLIDS—Stresses.

**089832 ANALYTICAL TREATMENT OF RELAXATION PROCESSES IN FREE JETS.** There are a number of important advantages in using free jets, compared to other experimental methods in physical kinetics among them the possibility of realizing the simplest one-dimensional radial steady flow; the self-modeling nature of the structure of the jet and the distribution of parameters in it; and the possibility of controlling the rates of relaxation processes. The author develops an analytical method of solving a system of relaxation equations of the detailed balance type, describing, for an appropriate choice of rate constants, rotational and vibrational relaxation, and also nonequilibrium condensation (the quasicheical model). After transforming from the population densities to smoother functions, and after a nonlinear change of variables, the system reduces to a form which is much easier to solve (both analytically and numerically). It is shown that for isentropic flow, there are several zones along the axis of the jet having different relaxation mechanisms. An iterative method of solving the system of relaxation equations is described. The method uses an optimum choice of the zeroth approximation in each of the zones. 15 refs.

**089833 THEORY OF DIFFUSIONAL RELAXATION OF THE COMPOSITION IN POLYDISPERSE POLYMER MELTS.** A general method is proposed helping to take into account the influence of polydispersity on relaxation processes in polymer melts. The relaxation of composition is considered in the melt of

two polymers far from the spinodal. Polydispersity leads to the appearance of a second relaxation time  $t_2$  considerably longer than the relaxation time  $t_1$  in a monodisperse system. For  $t \approx t_1$  relaxation of composition occurs by an exponential law, in the interval  $t_1 < t < t_2$  relaxation is of a power character again giving way to an exponential one at  $t \approx t_2$ . (Edited author abstract) 10 refs.

## Computer Aided Analysis

**089837 HADAMARD FILTERING TECHNIQUE APPLIED TO DIGITAL DISTANCE RELAYING.** This paper reports a high speed digital distance protection algorithm based on modified Hadamard filtering technique. The values of R and X of a transmission line were computed for S-L-G fault using simulated fault data. Off line digital computer results show fast operating speed, good accuracy and fast convergence of the computed values of R and X as compared to ordinary Hadamard filtering and rectangular transform technique. Because of low computer burden microprocessor implementation of the scheme may be easily achieved. (Author abstract). 6 Refs.

**089838 MICROPROCESSOR-BASED OVERFLUXING RELAY FOR A GENERATOR TRANSFORMER.** This paper describes a microprocessor-based overfluxing relay meant to protect a generator transformer under over-excitation conditions. The relay continuously monitors the system voltage and frequency and takes alarm and trip decisions on the basis of transformer iron losses computed by the microprocessor. An alarm signal is given when the total iron loss exceeds a predetermined threshold value continually for half a second and a trip signal is issued if the condition continues for 5-99 s (adjustable). The operating value of iron loss is adjustable over the range of 1.1 to 1.5 times the iron loss at rated voltage and rated frequency. A relay prototype based on an 8-bit microprocessor 8085 A has been tested successfully in the laboratory. (Author abstract) 5 refs.

**089839 FAST (1-SHIFT) ORTHOGONAL FUNCTIONS FOR EXTRACTION OF THE FUNDAMENTAL FREQUENCY COMPONENT FOR COMPUTER RELAYING.** For high speed impedance relaying, differential relaying and many other relaying functions employing a digital computer, it is necessary to extract the fundamental frequency component from a highly distorted post-fault relaying voltage or current. For this, the known methods employ either Fourier, Walsh or Harr algorithms. This paper describes a new set of odd/even orthogonal functions and compares its performance with other methods with respect to computational speed and frequency response. High computational speed is achieved by employing predetermined right-shift operations and avoiding any direct multiplications. (Author abstract) 3 refs.

## Computer Interfaces

**089842 STUDIES OF DISTANCE PROTECTION WITH A MICROPROCESSOR FOR SHORT TRANSMISSION LINES.** A type of zero-sequence-reactance relay suited to short transmission lines with a microprocessor is introduced. It has greater fault tolerance and is less sensitive to the load current,

especially in midsubstation. A new derivative-Fourier filter has been developed that can eliminate the influence of higher harmonics and restrain the damped DC component in the power system. Based on the analysis and calculation, a fault-detection scheme that operates correctly when a power swing follows a fault is presented. Power-swing blocking and fault-phase selection are discussed, and a complete, microprocessor-based protection system is discussed. 6 refs.

**089845 DEVELOPMENT OF THE DYNAMIC FAULT TREE USING MARKOVIAN PROCESS AND SUPERCOMPONENT.** In the Markovian approach for fault tree, the concept of the supercomponent is introduced in order to reduce the number of system states and the size of the transition matrix. Now, a number of basic events are considered to be one component in the Markovian process. Using the proposed dynamic fault tree analysis, a sample calculation is performed. As a result, the unavailability is much less than the value for the static fault tree analysis. Namely, the conservatism of the current analysis is excluded in this paper. The dynamic behavior of each system state and of the overall system is well analyzed. The interactions between the supercomponent tested and the supercomponent not tested are dynamically analyzed, too. (Edited author abstract) 13 refs.

**089851 IN-SERVICE RELIABILITY ESTIMATES FROM MAINTENANCE DATA.** One of the major problems in reliability engineering is the accurate feedback of reliability data when equipment has entered service. This paper describes one such case where an equipment user is interested in the reliability of equipment in service but has only limited resources to feedback reliability data. This paper describes the available raw data provided from a reporting system which records maintenance actions on each in-service equipment for work loading and spares planning purposes. The method developed to analyze this data to provide reliability estimates is discussed together with a validation exercise. Wider application of the method is considered feasible where data recording is similar to that considered in this paper. (Author abstract) 1 ref.

**089852 INTERVAL UNEFFECTIVENESS DISTRIBUTION FOR A k-OUT-OF-n MULTISTATE RELIABILITY SYSTEM WITH REPAIR.** This paper deals with a parallel load-sharing reliability system with cold standby redundancy and ample repair facilities. We have n identical parallel units, of which at most k units are operating simultaneously. If less than k units are available, the system operates at a proportionally reduced level. For this system, an approximate method is given for the calculation of the probability distribution of that proportion of the system capacity that cannot be used in a given time period. The method is based on an approximation of the k-out-of-n multistate system by a two-state single component. Validation of the approximation using Monte-Carlo simulation shows satisfactory performance. (Edited author abstract). 8 Refs.

**089853 ON CONSECUTIVE-k-OUT-OF-n: F SYSTEMS.** A brief survey of the consecutive-k-out-of-n: F system is given. Through the use of structure function and using network diagrams to represent the system, system reliability and algorithms for generating all the minimal path and cut sets are obtained. A lower bound and three upper bounds of the systems reliability are given. (Edited author abstract). 19 Refs.

**089854 ON THE FIRST FAILURE TIME OF DEPENDENT MULTICOMPONENT RELIABILITY SYSTEMS.** Multicomponent reliability systems are considered, where component failure and repair completion rates depend on the state, ages and current repair durations of the other components. This is a generalization of a model of S.M. Ross. Sufficient conditions on the sets of rates which imply stochastic ordering between first failure times of two such systems are found. Sufficient conditions on the rates which imply that the first failure time of such a system is new better than used (NBU) are given. A counterexample to an apparently stronger result of D.R. Miller is also given. (Edited author abstract). 20

**089859 APPROXIMATE METHODS FOR NON-LINEAR TIME-VARIANT RELIABILITY ANALYSIS.** Exact solution of reliability of structures under stochastic loadings is generally difficult. Various approximate methods have been developed based on an outcrossing rate analysis. Several first-order and second-order asymptotic methods are examined and compared in terms of the analytical and numerical efforts required as well as the accuracy of each method. Numerical examples are carried out, including one on the reliability of a structure with direction-sensitive resistance under the action of vector wind force to underscore the advantage and disadvantage of each method in practical applications. (Author abstract) 8 refs.

**089860 ACCELERATED FAILURE TIME MODELS FOR RELIABILITY DATA ANALYSIS.** Despite the popularity of the proportional hazards model (PHM) in analyzing many kinds of reliability data, there are situations in which it is not appropriate. The accelerated failure time model (AFT) then provides an alternative. In this paper, a unified treatment of the accelerated failure time model is outlined for the standard reliability distributions (Weibull, log-normal, inverse Gaussian, gamma). The problem of choosing between the accelerated failure time models and proportional hazard models is discussed and effects of misspecification are reported. The techniques are illustrated in the analysis of data from a fatigue crack growth experiment. (Author abstract) 18 refs.

**089861 SWITCHING-ALGEBRAIC ANALYSIS OF CIRCULAR CONSECUTIVE-K-OUT-OF-n: F SYSTEMS.** Switching-algebraic techniques are utilized in a simple and instructive derivation of the  $O(kn)$  recursive relation for a circular consecutive-k-out-of-n:F system with non-identical components. In addition, the boundary conditions associated with this recursive relation are developed. Consequently, an exact closed-form expression for system unreliability is obtained for the special case  $\{n \leq 2k\}$ . Finally, simple formulas are given for the Birnbaum importance of system components. (Author abstract) 13 refs.

**089862 RELIABILITY ANALYSIS IN DISTRIBUTED SYSTEMS.** Reliability of a distributed processing system is an important design parameter that can be described in terms of the reliability of processing elements and communication links and also of the redundancy of programs and data files. The traditional terminal-pair reliability does not capture the redundancy of programs and files in a distributed system. Two reliability measures are introduced: distributed program reliability, which describes the probability of successful execution of a program requiring cooperation of several computers, and distributed system reliability, which is the probability that all the specified distributed programs for the system are

operational. These two reliability measures can be extended to incorporate the effects of user sites on reliability. An efficient approach based on graph traversal is developed to evaluate the proposed reliability measures. 25 refs.

**089863 OVERVIEW OF COLLECTION, ANALYSIS, AND APPLICATION OF RELIABILITY DATA IN THE PROCESS INDUSTRIES.** Issues relevant to the collection, analysis, and application of reliability data are discussed. In terms of analysis, attention is given to: current common practice and its limitations; the need for feedback-to-data collection process; lack of high-quality software for reliability analysis; contribution of exploratory analysis techniques; problems of small data sets and of overinterpretations; and critical need for sensitivity analysis in reliability studies. In terms of applications, attention is given to the alternative purposes for which such reliability data can be used: safety, cost, legislation, and system availability evaluation; maintenance and replacement decisions; logistic support and spares provisioning; initial design and quality changes; and procedural and monitoring changes. 21 refs.

**089864 RELIABILITY ANALYSIS OF PUMPS FOR URANIUM SOLUTIONS.** Air-operated diaphragm pumps transfer a solution of highly enriched uranyl nitrate in nitric acid between process steps and recirculate the solution for mixing and filtration. In evaluating the data from manufacturers and performing limited testing, certain limitations have been noted on the application of the air-operated dual-diaphragm pump. In particular, the potential detrimental effects due to relatively high inlet suction pressure have led to the recommendation that an alternative pump be used on tall tanks and that precautions be taken to limit spill-potential on pumps used with shorter tanks. By manifolding the air exhaust from each pump in a manner yet to be determined, the spill potential can be substantially reduced. The high noise levels (approaching 90 dB) should be reduced.

**089869 UNCERTAINTY IN RELIABILITY EVALUATION PROCESSES AND A SIMULATION APPROACH TO TREATING IT.** The causes of uncertainty are discussed for three different situations: (a) in the process of designing new systems, when failure data are not yet available, (b) after performing reliability test and gathering failure data, and (c) in mission reliability prediction. It is concluded that, in performing reliability prediction or failure rate prediction, one should use interval estimates rather than point estimates. These intervals can be used to perform component classification and then, employing simulation, to obtain tables or scattergrams for the mean time between failures of a system or for system reliability. **089870 BAYESIAN RELIABILITY ANALYSIS OF SERIES SYSTEMS OF BINOMIAL SUBSYSTEMS AND COMPONENTS.** A Bayesian procedure is presented for estimating the reliability of a series system of independent binomial subsystems and components. The method considers either test or prior data (perhaps both or neither) at the system, subsystem, and component level. Beta prior distributions are assumed throughout. Inconsistent prior judgments are averaged within the simple-to-use procedure. The method is motivated by the following practical problem. It is required to estimate the overall reliability of a certain air-to-air heat-seeking missile system containing five major subsystems with up to nine components per subsystem. The posterior distribution of the overall missile-system reliability from which the required estimates are obtained is computed. (Author abstract) 18 refs.

**089872 APPLICATIONS OF THE HYBRID AUTOMATED RELIABILITY PREDICTOR.** The Hybrid Automated Reliability Predictor (HARP) is a software package that implements advanced reliability modeling techniques. In this paper we present an overview of some of the problems that arise in modeling highly reliable, fault tolerant systems, loosely divided into model construction and model solution problems. We then describe the HARP approach to these difficulties, which is facilitated by a technique called behavioral decomposition. The bulk of this paper presents examples of the evaluation of some typical fault tolerant systems, including a local area network, two fault tolerant computer systems (Carnegie-Mellon University multiprocessor system C.mmp, and Software Implemented Fault Tolerance (SIFT), and two examples of flight control systems. (Author abstract) 25 refs.

**089874 RELIABILITY OF A TEST PROCEDURE FOR IDENTIFYING DEFECTIVE COMPONENTS.** Fast and simple tests for detecting defects in components (or units) may be less reliable but they have obvious advantages over those that are exact but more costly and/or time-consuming. In this study, a model is proposed for predicting the reliability of a test procedure where simple and exact tests are combined so as to minimize the number of costly and time-consuming tests. The maximum likelihood method is used to estimate the necessary parameters, such as the actual number of abnormal units in a multi-unit system under test, and the

probabilities of correctly and incorrectly identifying a unit as abnormal. (Author abstract) 11 refs.

**089875 DEVELOPMENT AND UTILIZATION OF A GENERALIZED THREE-STATE MODEL.** The basic component representation used in many studies of reliability and availability in the two-state model in which the component is designated as being in the up or down state. In some cases, however, the component can reside in an in-between state, and a three-state representation is required. This representation is often used to model large generating units in power system adequacy or security evaluation. The inclusion of the third or derated state in this case can have an appreciable influence on the calculated system risk. The basic three-state model can be utilized in a wide range of applications using both limiting and time dependent state probabilities. This paper illustrates the development of a generalized three-state model and presents a basic set of equations which can be utilized in a wide range of applications. The utility of the model is illustrated by three specific applications taken from the power systems area. (Author abstract) 5 refs.

**089876 INFLUENCE OF IMPERFECT KNOWLEDGE ON THE FAILURE BEHAVIOUR OF PERIODICALLY TESTED STANDBY COMPONENTS.** A reliability model for periodically tested standby components is introduced, which takes into account hardware component failure as well as its interaction with the imperfect failure detection and recovery process. As the parameters of the model are not directly observable, they have to be calculated from properties of operational experience which are functions of the model parameters. This model can be applied to explain model uncertainties arising from the user of simpler models both qualitatively and quantitatively, especially with respect to the evaluation of operational experience on component failure behavior. (Author abstract) 4 refs.

**089877 STUDY OF A 2-UNIT SYSTEM WITH 'RANDOM BREAKDOWN' OF THE REPAIR FACILITY.** A two-unit cold standby system supported by a single repair facility is considered. The units after each repair do not behave as new and a unit can be repaired exact  $k$  ( $k < \infty$ ) times. The failure time distribution of either unit is different after each repair. The repair facility is subjected to random breakdown with exponential lifetime and exponential repair time distributions. The availability and reliability measures and the MTBF are provided for the model. (Author abstract). 3 refs.

Bhat, K. Shankar (Madras Christian Coll, Madras, India); Gururajan, M.; Nayak, Panduranga. *Microelectron Reliab* v 28 n 3 1988 p 369-371.

**089878 ONE UNIT RELIABILITY SYSTEM SUBJECT TO RANDOM SHOCKS AND PREVENTIVE MAINTENANCE.** In this paper we consider two systems each consisting of one unit. The operating unit is subject to random shocks which occur at random times. Due to the shock the following may happen: (i) the unit is not at all affected by the shock; (ii) the failure rate of the unit increases from  $\lambda_0$  to  $\lambda_1$ ; (iii) the unit fails. The failure time of the unit is exponentially distributed. The repair, shock and preventive maintenance times follow general distributions. In System 2 there is provision of preventive maintenance, whereas in System 1 there is no provision of preventive maintenance. There is one repair man available in each system. In this paper the mean time to system failure, steady state availabilities and the impact of shocks on these are studied. In System 2 the effect of the preventive maintenance on MTSF and steady-state availabilities is investigated. (Author abstract). 8 Refs.

**089879 COMPARISON OF ALGORITHMS FOR TERMINAL-PAIR RELIABILITY.** Four algorithms for the terminal-pair reliability problem are compared. Nelson, Lin, Shooman, and Dotson algorithms are used in this study. It is shown that the Dotson algorithm is the fastest among the terminal-pair reliability algorithms analyzed. The Dotson algorithm is suited not only for numerical reliability, but for obtaining symbolic expression for the terminal-pair reliability with no additional effort. By modifying the Dotson algorithm the efficiency can be further improved. The modifications to this algorithm are listed and the reliability of the modified Dotson algorithm is computed. 10 refs.

**Optimization** See Also ELECTRIC POWER SYSTEMS—Reliability; HYDRAULIC TURBINES—Impellers.

**089880 OPTIMAL RELIABILITY DEMONSTRATION FOR BINOMIAL TESTING SITUATION.** Design and reliability requirements depend upon the available technology and its state of the art design capability and requirements of the customer. A product is designed and developed based on these requirements. Reliability requirements must take into consideration costs related to testing, risks related to type I and type II errors and other cost elements related to fielded products such as maintenance burden. The purpose of this paper is to model the decision making process for determining the reliability requirements and associated optimal test strategies to demonstrate these requirements for binomial testing situation. Optimization models consider cost elements related to design and development, testing, and inherent risks involved in accepting the product based on testing. (Author abstract) 6 refs.

## Theory

**089882 COHERENT CONTINUOUS SYSTEMS AND THE GENERALIZED FUNCTIONAL EQUATION OF ASSOCIATIVITY.** A theory of coherent continuous systems is outlined. Systems are to be decomposed hierarchically into modules. For this purpose, some results on the structure of continuous functions are adapted to generalize the classic 3-Modules Theorem of binary systems. Consideration of the modular structure of coherent continuous systems leads naturally to the generalized functional equation of associativity  $G(g(u,v), w) = H(u, h(v, w))$  involving four unknown 2-place continuous functions. The functional equation is solved under some regularity conditions motivated by the properties of coherent continuous systems. The solutions obtained give rise to generalized notions of parallel and series system structures. (Author abstract) 22 refs.

**089883 CLASS OF BETTER MEAN RESIDUAL LIFE AT AGE  $T_0$ .** The conditional mean remaining life of an item of age  $t$  is called the mean residual life (MRL) at age  $t$ . In this paper we introduce a better mean residual life at  $t_0$  (BMRL- $t_0$ ) class of life distributions, where the MRL decreases initially during  $[0, t_0]$  and then for  $t \geq t_0$  the MRL at time  $t$  is not greater than the MRL at  $t_0$ . It is shown that the BMRL- $t_0$  class contains the DMRL class, but it is a proper subclass of the NBUE class. The dual class of worse mean residual life at  $t_0$  (WMRL- $t_0$ ) is defined by reversing the direction of inequality. Some characteristics of these two classes are presented. We also develop the tests of exponentiality against the BMRL- $t_0$  (WMRL- $t_0$ ) alternatives. (Author abstract) 11 refs.

**089885 CONDITION PARAMETER BASED APPROACH TO CALCULATION OF RELIABILITY CHARACTERISTICS.** The classical approach to the calculation of reliability characteristics is based on the probability distribution of time to failure. The system under consideration is accepted as a 'black box' which performs the required function until it fails. This paper presents an 'engineering' approach to the calculation of reliability characteristics which attempts to obtain the same results at the same time providing information about 'what is going on inside the box'. According to the new approach, reliability characteristics have been determined using the probability distribution of a relevant conditions parameter which fully describes the condition of the system in every instant of operating time. It is applicable to those systems whose components fail gradually. This approach offers greater potential for practical application in maintenance theory. The proposed approach can also be used as a method for accelerated testing or reliability of engineering systems and their components. (Edited author abstract) 6 refs.

**089888 METHOD FOR REDUCING THE NUMBER OF PRODUCT TERMS IN A SYMBOLIC RELIABILITY EXPRESSION.** Among methods for deriving a symbolic reliability expression between two specified vertices ( $s, t$ ) in a network, a tree-expansion method proposed herein generates an expression in summation form with fewer product terms and computes it very fast. We show by computer experiments that the modified tree-expansion method can reduce the number of product terms and its running time. (Edited author abstract) 9 refs.

**089889 ON THE ASYMPTOTIC BEHAVIOUR OF MEAN RESIDUAL LIFE FUNCTION.** The mean residual life (MRL) function is useful in defining a good decision-making criterion for replacement policies and in solving burn-in problems. It provides a more descriptive measure of the aging process than the hazard rate. A relationship between the asymptotic values of the mean residual life function and the hazard rate of a generic continuous distribution function is derived. It is also shown that the derivative of the MRL function of a positive random variable always tends to zero as  $t \rightarrow \infty$ . (Edited author abstract) 10 refs.

**089891 TWO DUPLEX UNIT STANDBY SYSTEM WITH TWO TYPES OF REPAIR.** This paper is concerned with a two duplex unit standby system involving two types of repair, i.e. cheaper and costlier. When the cheaper repairman does not repair the failed duplex unit within a tolerable time (maximum cheaper repair time) the costlier repairman is called on to do the repair. The time to failure of a duplex unit is taken to be negative exponential, while the repair time distribution is arbitrarily distributed. The system is analysed by using the supplementary variable technique to obtain various related measures. (Author abstract) 4 refs.

Singh, H.R. (Ravishankar Univ, Raipur, India); Singh, S.K.; Shukla, Sindhu. *Microelectron Reliab* v 28 n 1 1988 p 11-14.

**089892 GERT ANALYSIS OF SAMPLING PLAN FOR SYSTEM RELIABILITY.** The Graphical Evaluation and Review Technique (GERT) has been applied to modelling of an acceptance sampling plan for a two component parallel system exhibiting standby redundancy. (Edited author abstract) 10 refs.

Shankar, Gauri (Ravishankar Univ, Raipur, India). *Microelectron Reliab* v 28 n 1 1988 p 23-25.

**089893 SYSTEM RELIABILITY DESIGN WITH DETERIORATIVE COMPONENTS.** In constrained optimum system reliability problems, the reliability of each component is usually assumed to be fixed, and the optimal number of redundancies at each stage is determined. However, in the real world the component reliability decreases as component deteriorates; i.e. the component reliability is dependent on its age. This paper presents a system reliability optimization problem with deteriorative components. We formulate this problem as a parametric nonlinear integer programming problem where the objective function has a time parameter  $t$ . A solution method is proposed for solving it. We believe that this model can provide useful information for decision makers and reliability designers. (Edited author abstract) 5 refs.

**089894 ON ESTIMATING THE SHAPE PARAMETER OF THE WEIBULL DISTRIBUTION BY SHRINKAGE TOWARDS AN INTERVAL.** This paper proposes some shrunken estimators for the shape parameter of the Weibull distribution under censored sampling when some a priori or guessed interval containing the parameter  $\beta$  is available. Extensions of the work done in Pandey and Singh (1984) have been considered. Comparisons of the proposed estimators with the usual unbiased estimator, in terms of mean squared error are made. It is found that the proposed estimators are preferable to the usual estimator in some guessed interval of the parameter space of  $\beta$ . (Author abstract) 14 refs.

**089895 GO-FLOW: A NEW RELIABILITY ANALYSIS METHODOLOGY.** A new reliability analysis methodology, GO-FLOW, is presented. Detailed explanations and two examples of GO-FLOW analysis are given. The GO-FLOW is a success-oriented system analysis technique. The modeling technique produces the GO-FLOW chart, which is composed of operators and signal lines and represents a function of the system. A signal does not represent a 'change of condition' but some physical quantity or information. The intensity of a signal represents the probability of actual or potential existence of a physical quantity, the probability that some information exists, or a time interval between two successive time points. The examples of analysis show the applicability of the GO-FLOW method to a phased mission problem (a boiling water reactor emergency core cooling system) and to a time-dependent unavailability analysis (a pressurized water reactor auxiliary feedwater system). The GO-FLOW has proved to be a valuable and useful tool for system reliability analysis. (Author abstract) 11 refs.

**089896 SOME EXTREMAL PROBLEMS IN RELIABILITY THEORY.** Two extremal problems in reliability theory are examined. In one of them, exact lower estimates for the probability of failure-free operation of a system in the class of unimodal distributions with two

fixed moments are found. In the other, an  $M|G|m$  queueing system in which the renewal time is a random variable which is Khinchin-infinitesimal, is examined. It is proven that if formation of a queue for renewal is allowed in the system, one can choose the renewal time such that the probability of failure of the system in the busy interval along nonmonotonic trajectories is comparable with the probability of the same event in combination with monotonic trajectories. (Author abstract) 10 refs.

**089903 DISTRIBUTION OF MAXIMUM FLOW WITH APPLICATIONS TO MULTISTATE RELIABILITY SYSTEMS.** This paper describes an efficient Monte Carlo sampling plan for estimating the distribution of maximum flow in a directed network whose arcs have random capacities. The proposed sampling plan uses an easily computed a priori upper bound on the complementary distribution function to obtain an unbiased point estimator with smaller variance than the estimator obtained by crude Monte Carlo sampling. The paper also describes procedures for interval estimation and for assessing when the sampling experiment has achieved a specified accuracy. To facilitate sampling, we use cumulative processes to characterize deterioration, leading to the treatment of arc capacities as being multinormally distributed. (Edited author abstract) 20 refs.

**089905 RELIABILITY CONCEPTS UNDER THE THEORY OF EVIDENCE.** This paper presents an approach to reliability theory from the point of view of the theory of evidence. The basic assumption is that the time to failure (life) of an equipment is a variable characterized by means of an evidence on the real line, instead of a probability distribution (the classical model). Firstly some concepts of Dempster-Shafer's theory of evidence for a non-necessarily finite set are given. Then the fundamental concepts under the formulation of Dempster-Shafer's theory are introduced. (Author abstract) 13 refs.

**089906 RELIABILITY PREDICTION USING ALTERNATIVE METHODS.** Alternative methods may be used for predicting reliability, when approved by the Project Manager. This section outlines these methods and the conditions under which they may be applied. The alternative methods covered by this section are: crystal ball, astrological, wet finger, miscellaneous techniques (Tarot cards, ouija boards, tea leaves, etc.) and witchcraft.

Anon. *Qual Reliab Eng Int* v 4 n 1 Jan-Mar 1988 p 3.

**089907 INHERENT UNRELIABILITY OF RELIABILITY DATA.** The availability of good data is crucial to good reliability prediction. Two contrasting cases are noted: (1) when a large amount of experience with components is available but data are not collected and (2) when systems are so innovative that no reliability experience is available. The relationship of reliability to incompleteness of knowledge and the acausal nature of statistical/probabilistic models is discussed. The difficulty of assigning any absolute similarity between any one component and the members of a particular reliability set is outlined. It is concluded that engineering judgement must always play a vital role in reliability estimation. (Author abstract) 5 refs.

**089908 RELIABILITY AND MTTF EVALUATION OF A REPAIRABLE COMPLEX SYSTEM UNDER WAITING.** This paper deals with the reliability and mean time to failure (MTTF) evaluation of a complex system under waiting incorporating the concept of hardware failure and human error. Failure rates of the complex system follow exponential time distributions, whereas repair follows a general repair time distribution. Laplace transforms of various state probabilities have been evaluated and reliability is obtained by the inversion process. A formula for variance of time to failure has been developed. A particular case is also given to highlight some important results. (Edited author abstract) 1 ref.

**089911 ANALYSIS OF A SIMPLE DEBUGGING MODEL.** A system has an unknown number of faults. Each fault causes a failure of the system, and is then located and removed. The failure times are independent exponential random variables with common mean. A Bayesian analysis of this model is presented, with emphasis on the situation where vague prior knowledge is represented by limiting, improper, prior forms. This provides a test for reliability growth, estimates of the number of faults, an evaluation of current system reliability, a prediction of the time to full debugging, and a model checking procedure. Three examples are given. (Author abstract) 31 refs.

**089914 EVALUATION OF AVAILABILITY COEFFICIENT OF A COMPLEX SYSTEM OF NONHOMOGENEOUS ELEMENTS UNDER LIMITED RENEWAL.** A method for evaluating the availability coefficient of complex engineering systems with various types of structural standby under limited renewal is proposed. The method is based on joint utilization of Boolean reliability models and queueing networks. (Author abstract). 4 Refs.

Gagin, A.A. *Sov J Comput Syst Sci* v 26 n 1 Jan-Feb 1988 p 101-108.

**089915 METHOD FOR EVALUATING ALL THE MINIMAL CUTS OF A GRAPH.** A technique is introduced to determine all minimal cuts for all the sink nodes in a nonplanar network. The algorithm uses a subset method and an iterative process to achieve high efficiency. For an N-sink node network there are  $(2^N-1)$  possible combinations of nodes (nonempty subsets). These subsets are checked against several criteria to see if they can be transformed into minimal cutsets. An iterative process is used to generate these nonempty subsets efficiently so that the number of subsets to be checked is about  $(2^N-1)/2$ . Since this algorithm generates all the minimal cutsets for all nodes in one operation, it is faster than conventional methods that compute them for one sink node at a time. Tests using random graphs showed a small CPU time per minimal cutset. 5 refs.

Jasmon, G.B. (Univ of Malaya, Kuala Lumpur, Malays); Foong, K.W. *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 539-545.

**089916 RELIABILITY OF SYSTEMS WITH CONSECUTIVE MINIMAL CUTSETS.** A class of system cutsets called consecutive minimal cutsets is defined. A simple algorithm is presented for computing exactly the reliability of systems with this property. A generalized class of consecutive-k-out-of-n:F systems, called consecutively connected systems, is shown to have this property. 16 refs.

Shanthikumar, J. George (Univ of California, Berkeley, CA, USA). *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 546-550.

**089917 FAILURE PROBABILITY OF STRICT CONSECUTIVE-K-OUT-OF-N:F SYSTEMS.** A system with n components in sequence is a strict consecutive-k-out-of-n:F system if and only if it fails when at least k consecutive components have failed, but isolated strings of component failures of length less than k do not occur. The failure probability function of a strict linear consecutive-k-out-of-n:F system is given in a closed form. The calculation of the failure probability of a strict circular consecutive-k-out-of-n:F system is reduced to the linear case. 4 refs.

Kossov, Andreas (Wismar Technological Univ, West Ger); Preuss, Wolfgang. *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 551-553.

**089918 MODIFIED TECHNIQUE FOR COMPUTING NETWORK RELIABILITY.** S. H. Ahmad (1982) has published a technique to compute the reliability of a network without resorting to paths or cutsets. The technique uses a random choice of next node connected to the previous node in the construction of a tree, which can lead to a large number of terms in the reliability expression. A modified version of the Ahmad technique is presented that always produces a reliability expression with the same or fewer terms as the original technique. 7 refs.

Ahmad, S. Hasanuddin (King Abdul Aziz Univ, Jeddah, Saudi Arabia); Jamil, A.T.M. *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 554-556.

**089919 RELIABILITY MODELING AND EVALUATION FOR NETWORKS UNDER MULTIPLE AND FLUCTUATING OPERATIONAL CONDITIONS.** A simple multistate Markov process is used to model a component and a system of any configuration under several operational conditions. Using the model, a simple tie-set approach calculates availability and frequencies of system failure for various conditions; a cut-set approach calculates probabilities of the system being in a particular condition. There are two interpretations of operational conditions: (1) environmental conditions such as weather or stress, and (2) other operating conditions that occur in several sequential or fluctuating phases. As the system is assumed at any moment to be under a condition with a certain probability or weight, some relative reliability measures can be further obtained simply to identify which conditions are disastrous. 15 refs.

Yuan, John (Nat'l Tsing Hua Univ, Hsinchu, China); Lin, Chin-Hu; Chang, Say Jau; Lai, Shen-Hua. *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 557-564.

**089920 MEAN TIME TO ACHIEVE A FAILURE-FREE REQUIREMENT UNDER PROVISIONS OF SPARE AND REPAIR.** The author considers a one-unit system supported by a repair facility and a single spare. This unit is put on test. When the unit fails, the spare instantaneously takes over as the new operating unit, and the failed unit is repaired. The system fails when the unit, currently operating, fails before the repair of the latest failed unit is completed. The testing is continued until several ( $s > 0$ ) consecutive time units of failure-free operation are obtained. This is a failure-free test and  $s$  is a failure-free requirement. These tests have been proposed when a consumer wants assurance that a unit will survive failure-free for a certain period. The author obtains an expression for the mean test time to achieve a failure-free requirement under the provisions of spare and repair. 3 refs.

Ebrahimi, Nader (Northern Illinois Univ, DeKalb, IL, USA). *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 565-567.

**089921 BAYES RELIABILITY GROWTH MODEL FOR A DEVELOPMENT TESTING PROGRAM.** The problem of estimating the reliability of a system during development is considered. The development process has several stages, and at each stage binomial test data are obtained by testing a number of such systems on a success/fail basis. Marginal posterior distributions are derived under the assumption that the development process constrains the reliabilities to be nondecreasing and that the prior distribution for reliability at each stage is uniform. Simulation models are designed to facilitate testing for the validity and computation of the Bayesian model with ordered reliabilities as well as to compare results with other reliability growth models. 9 refs.

Fard, Nasser S. (Northeastern Univ, Boston, MA, USA); Dietrich, Duane L. *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 568-572.

**089922 COMPUTING MAXIMUM-LIKELIHOOD PARAMETER ESTIMATES OF THE GENERALIZED GAMMA DISTRIBUTION BY NUMERICAL ROOT ISOLATION.** The generalized gamma distribution (GGD) is important in reliability modeling and includes as special cases the Weibull, gamma, and exponential distributions. Unfortunately, the numerical difficulties associated with fitting the GGD to data have been a major impediment to its wider use. The parameter likelihood equations (LEs) can possess no solution or

several solutions, and the Newton-Raphson method is, in general, poorly behaved when applied to the LEs. An algorithm is described that uses a heuristic root isolation method to circumvent these difficulties. The algorithm can be used to determine the maximum-likelihood estimates of the parameters of the GGD or to indicate that none exists. 14 refs.

Wingo, Dallas R. (Bell Communications Research, Red Bank, NJ, USA). *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 586-590.

**089923 COMPARISON OF THE PREDICTION OF FUTURE ORDER STATISTICS FOR THE 2-PARAMETER GAMMA DISTRIBUTION.** The author considers the prediction of future order statistics based on type-II censored samples from the two-parameter gamma distribution with unknown scale parameter and semi-known shape parameter. Among the four predictors considered, the cross-validator predictor performed best in terms of guaranteed efficiency. An advantage of this estimator is that it uses only the mean values of order statistics and not the covariances, which are more difficult to compute. 18 refs.

Balasooriya, Uditha (Nat'l Univ of Singapore, Singapore). *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 591-594.

**089924 FITTING AND OPTIMAL GROUPING ON GAMMA RELIABILITY DATA.** Two statistics are presented for testing gammality on the basis of complete and incomplete random samples with unknown scale parameter. The distributions of the test statistics were approximated by using Monte Carlo simulation. The power of the statistics is investigated with respect to several alternatives. Statistical methods are presented for reliability measurement from grouped data on items from a gamma life distribution. The maximum method is used to estimate reliability, and tables are given for asymptotically optimal inspection time of the life tests which are monitored only periodically. 7 refs.

Wei, Duan (Bur of Statistics, Taipei, Taiwan); Shau, C.K. *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 595-599.

**089925 SOME OPTIMAL DESIGNS FOR GROUPED DATA IN RELIABILITY DEMONSTRATION TESTS.** Optimal demonstration test designs using grouped inspection data from logistic, log-logistic, normal/Gaussian and log-normal distributions are studied. The test statistics of the mean life and reliability for the distributions are considered. Tables for optimally spaced inspection of these distributions are obtained. 4 refs.

Wei, Duan (Bur of Statistics, Taipei, Taiwan); Bau, Jinn-Jomp. *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 600-604.

**089926 SEQUENTIAL TEST FOR THE RATIO OF TWO CONSTANT FAILURE RATES.** An exact sequential test is given for two similar types of equipment in terms of the ratio of their constant failure rates. The plans are useful for incentives in comparative life testing of equipment during its constant-failure-rate period. The theory and equations for the tables are developed and the related references are included. Three test plans are summarized. 4 refs.

**089927 SIMPLE BAYES TEST OF EQUALITY OF EXPONENTIAL MEANS.** An approximate  $\chi^2$ -test statistic tests the homogeneity of scale parameters of several

exponential distributions from a Bayes viewpoint under types I and II censoring. The quantiles of the statistic are simulated and found to be very close to the exact quantiles of a  $\chi^2$  distribution. 12 refs.

Shoukri, M.M. (Univ of Windsor, Ont, Can). *IEEE Trans Reliab* v R-36 n 5 Dec 1987, 1987 Proc - Reliab & Maint in Comput-Aided Eng Workshop, Leesburg, VA, USA, Aug 25-26 1987 p 613-616.

**089928 RELIABILITY OPTIMIZATION WITH THE LAGRANGE-MULTIPLIER AND BRANCH-AND-BOUND TECHNIQUE.** A method has been developed for constrained reliability optimization problems that incorporates the Lagrange multiplier method and the branch-and-bound technique. The Lagrange multiplier method treats the number of redundancies as real numbers. Once a real number solution is obtained, the branch-and-bound technique is used to obtain the integer solution. The optimization method is applied to the redundancy allocation problem for a four-stage series system, and to the reliability-redundancy allocation problem for a five-stage series system with three nonlinear constraints. The results show that the proposed method is better than previous methods for both problems. 16 refs.

**089930 BOUNDING NETWORK-RELIABILITY USING CONSECUTIVE MINIMAL CUTSETS.** A subset of consecutive minimal cutsets of the set of cutsets is used to develop an efficient algorithm to compute an upper bound for the reliability of a network. The reliability is the probability that a path consisting only of functioning arcs exists between the source and the sink of the network. The nodes of this network are perfect, but the arcs are independent and either function or fail with known probabilities. For the case of source-to-sink planar networks, an approach to obtain a lower bound for the reliability of the network is also presented. Examples illustrate the use of the algorithm and show that the upper bound is, in many cases, better than that obtained by A. W. Shogan (1976). 21 refs.

**089931 RELIABILITY BOUNDS FOR DEPENDENT FAILURES.** Upper and lower bounds are obtained for the reliability of a series system with statistically dependent component failures. The method can be applied to series subsystems when these are obtained by decomposing a complex system. Numerical examples illustrate the use of the method. 5 refs.

Parkinson, D.B. (Univ of Liverpool, Engl). *IEEE Trans Reliab* v 37 n 1 Apr 1988 p 54-56.

**089932 DIRECT ALGORITHM FOR COMPUTING RELIABILITY OF A CONSECUTIVE-K CYCLE.** A consecutive-k cycle is a circular system such that the system fails if and only if any  $k$  consecutive components

all fail. Reliabilities for consecutive-k cycles are usually computed by recursive equations. However, most recursive equations proposed so far for the cycle involve reliabilities for consecutive-k lines, requiring two passes where the first pass computes only the line reliabilities. A recursive equation involving cycles only is proposed that is simpler in form but much harder to understand on intuitive grounds. Another advantage is that the proposed cycle recursion has the same form as a line recursion previously proposed. Thus a uniform treatment of lines and cycles is possible. This uniform approach is used to obtain some explicit solutions of both line and cycle reliabilities for  $2 \leq k \leq 4, 6$  refs.

**089933 RELIABILITY OF AN M-OUT-OF-N SYSTEM WHEN COMPONENT FAILURE INDUCES HIGHER FAILURE RATES IN SURVIVORS.** An m-out-of-n-G system is composed of statistically independent and identically distributed components with exponential lifetimes. The reliability of such a system is obtained under the assumption that the failure of a component changes the failure rate of the surviving components. 4 refs.

Scheuer, Ernest M. (California State Univ, Northridge, CA, USA). *IEEE Trans Reliab* v 37 n 1 Apr 1988 p 73-74.

**089934 STATISTICAL SIMULATION METHODS FOR INVESTIGATING THE STRUCTURE OF RELIABILITY OPTIMIZATION.** Qualitative and quantitative techniques for reliability sampling plans are described. An example shows how to apply the techniques to detect service life and the effectiveness of reliability. The relationships between sample size, confidence limits, number of failed units during the test, and the fraction of reliable units is shown. By statistical simulation, 55 practical sampling plans were developed. The statistical simulation, with the aid of finite differences and computer analysis, provided a good solution of the authors' research problems. The distribution of the data corresponds rather accurately to the given curves, which are the inverses of the functions of the theoretical distribution based on the formalized approach. 5 refs.

## Costs

**089938 COST LIMIT REPLACEMENT POLICY UNDER IMPERFECT REPAIR.** A repair cost limit policy is studied for a system whose repair cost can be estimated by inspection. When a system fails, the repair cost is estimated and repair is undertaken if the estimated cost is less than a predetermined limit  $L$ ; otherwise, the system is replaced. After repair, the system is as good as new with  $(1-p)$  or is minimally repaired with  $p$ . The s-expected cost rate is used as a criterion for optimization. The existence and uniqueness of optimum  $L$  are studied for the case of Weibull time-to-failure distribution and negative exponential repair cost distribution. (Author abstract) 14 refs.

## Estimation

**089939 MODIFIED SHRINKAGE TECHNIQUE FOR ESTIMATION OF THE EXPONENTIAL SCALE PARAMETER.** A method of minimizing the mean square error (MSE) of the modified shrunken estimator of the scale parameter of the exponential population is considered. The method used is modified shrinkage of the minimum variance unbiased linear estimator (MVULE) towards a prior in the parameter space. The modified shrunken estimator is: (i) independent of prior  $\theta_0$ ; (ii) better than the MVULE given by Epstein and Sobel; (iii) better than the shrunken estimator given by Thompson, in the sense of having a smaller MSE. (Author abstract) 5 refs.

**089941 SHRINKAGE TESTIMATOR FOR SCALE PARAMETER OF AN EXPONENTIAL DISTRIBUTION.** A shrinkage estimator, based on a test of hypothesis when an initial estimate of the scale parameter is available, has been proposed. The salient feature of the proposed estimator is that, being dependent on the test statistic, it removes arbitrariness in the choice of the shrinkage factor of a given level of significance. Expressions for bias, mean square error and relative efficiency with respect to the conventional estimator have been

derived. It has been shown that by taking the square of the shrinkage factor the relative efficiency of the estimator can be increased. (Edited author abstract) 4 refs.

**Mathematical Models** See Also PROBABILITY—Mathematical Models; RELIABILITY.

**089943 USE OF SPARE TIME IN SINGLE-SERVER SYSTEMS WITH TWO TYPES OF FAILURE.** One distinguishes between two types of failure in engineering systems, depending on the outcome of the loss of operability. If a failure does not lead to the destruction (loss of value) of the results of preceding operation, but causes only a delay in performing the task for the duration of the restoration of operability, then it is called a nondestructive (or nondepreciating) failure of the first type. Semi-Markov reliability models of an element are considered, and explicit expressions for the probability of task completion for exponential distributions are found. Here we present a generalization of earlier results to the case of a system of arbitrary structure in the class of semi-Markov models of operation. 5 refs.

**089948 COMPARISON OF POSITION AND RATE CONTROL FOR TELEMANNIPULATIONS WITH CONSIDERATION OF MANIPULATOR SYSTEM DYNAMICS.** Position and rate control are the two common manual control modes in teleoperations. Human operator performance using the two modes is evaluated and compared. Simulated three-axis pick-and-place operations are used as the primary task for operation. First, ideal position and rate control are compared by considering several factors, such as joystick gain, joystick type, display mode, task, and manipulator work space size. Then the effects of the manipulator system dynamics are investigated by varying the natural frequency and speed limit. Experimental results show that ideal position control is superior to ideal rate control, regardless of joystick type or display mode, when the manipulation work space is small or comparable to the human operator's control space. Results also show that when the manipulator system is slow, the superiority of position control disappears. Position control is recommended for small-work-space telemanipulation tasks, while rate control is recommended for slow wide-work-space telemanipulation tasks. 23 refs.

**089950 STATISTICAL OPTICAL MODEL FOR LIGHT REFLECTION AND PENETRATION THROUGH SAND.** The aggregate soil reflectance is an important parameter in remote sensing. It was found that soil reflectance initially decreases with an increase in moisture content and subsequently increases with higher moisture content. The present work embodies an attempt to analyze this effect and explain its physics. A new concept of cut-off thickness is evolved to interpret optical characteristics of sand as a multi-layer process. A statistical phenomenological model is developed to account for the observed dependence of the aggregate reflectance of sand and the cut-off thickness of various fractions of sand. The presence of moisture is found to affect the optical characteristics in two different ways. (Edited author abstract) 2 refs.

**089951 REMOTE SENSING METHODOLOGIES AND GEOGRAPHY.** Remote sensing is a technique used in scientific and technological approaches to geographical research. In the scientific approaches the motivation is curiosity, the goal is knowledge and the methodology is often induction to derive theory and then deduction to verify theory. In the technological approaches the motivation is human need, the goal is the application of knowledge and the methodology is design. This review discusses both approaches, concentrating on the problems of taking a scientific approach and the unwillingness of geographers to accept an often more suitable technological approach. It is argued throughout that both types of approach can be valid, both can be useful and both are suitable methodologies for remote sensing in geography. (Edited author abstract) 140 refs.

**089955 SATELLITE-DERIVED COLOR - TEMPERATURE RELATIONSHIP IN THE ALBORAN SEA.** Improved understanding of biooptical responses to physical and chemical processes in the ocean can be obtained through the analyses of ocean color - temperature relationships using satellite data. These data can be used to trace the mixing of water masses along the frontal zones and to suggest patterns of subsurface and horizontal advection. To illustrate this concept, the ocean color and sea surface temperature relationships in the Alboran Sea are derived from the Coastal Zone Color Scanner (CZCS) (color) and the Advanced Very High Resolution Radiometer (AVHRR) (sea surface temperature) satellite data. Near-coincident (2.5 h) images from these satellite systems are registered and converted into quantitative estimates of biooptical properties and sea surface temperature. Water masses are classified based on unsupervised clustering analyses of these satellite-derived parameters. (Edited author abstract) Refs.

**089956 CANOPY REFLECTANCE MODEL BASED ON AN ANALYTICAL SOLUTION TO THE MULTIPLE SCATTERING EQUATION.** An approximation to the radiative transfer equation for solar radiation in relatively full, homogeneous plant canopies is presented and solved analytically for solar zenith angles less than 60°. The model predicts reflectance at any depth in the canopy and in any direction and may be inverted with bidirectional reflectance measurements. It may be analytically integrated over the hemisphere at any depth, which makes it useful for energy balance studies, in particular for calculating albedo and intercepted photosynthetically active radiation. The fact that it may be calibrated with directional reflectance measurements and the exact nature of the solution may make it an improvement over the two-stream approximation as applied to canopy scattering problems. (Edited author abstract) Refs.

Camillo, Peter (NASA, Greenbelt, MD, USA). *Remote Sens Environ* v 23 n 3 Dec 1987 p 453-477.

**089957 EXTRACTION OF SPECTRAL HEMI-SPHERICAL REFLECTANCE (ALBEDO) OF SURFACES FROM NADIR AND DIRECTIONAL REFLECTANCE DATA.** A radiative transfer model was used to explore how the error in inferring spectral hemispherical reflectance ( $\rho_\lambda$ ) from nadir reflectance values varies as a function of wavelength, solar zenith

angle, leaf area index and leaf orientation distribution. Secondly, a technique using multiple spectral nadir reflectance values to infer  $\rho_\lambda$  for a single wavelength was tested using field data. In addition, several techniques that use multiple off-nadir view angles taken in azimuth planes were tested using field data. These latter techniques were very accurate and are ideally suited to present and future sensor systems that scan in a known azimuth plane and other scanning radiometers or view fore and aft in a known azimuth plane (e.g., Advanced Solid-State Array Sensor (ASAS), Moderate Resolution Imaging Spectrometer (MODIS), High Resolution Imaging Spectrometer (HIRIS)). (Edited author abstract) 26 refs.

**089958 MAXIMUM LIKELIHOOD CLASSIFICATION, OPTIMAL OR PROBLEMATIC? A COMPARISON WITH THE NEAREST NEIGHBOUR CLASSIFICATION.** The maximum likelihood and the nearest neighbor classification algorithms are reviewed, particularly from the point of view of user/analyst requirements. The two algorithms were put to use for the classification of Landsat TM data of agricultural scenes and accuracy with respect to 'ground truth' was evaluated using different parametric settings. Results show that within the maximum likelihood classification, accuracies and errors can vary to a considerable degree depending on the formation of the statistical classes from the training data. More interestingly, it was found that the nearest neighbor algorithm produced higher accuracies and was judged to be more robust, but it has computer implementation problems with high data dimensionality. (Author abstract) 8 refs.

**089959 ATMOSPHERIC CORRECTION OF THERMAL INFRARED DATA USING MULTI-HEIGHT DATA ACQUISITION.** Information acquired using a Daedalus AADS 1230 thermal infrared scanner flown at three different altitudes has been analyzed with a view to determining whether these data could be used to determine path transmittance and radiance with subsequent correction of the remotely-sensed radiant temperatures for atmospheric effects. The results are given and it is demonstrated that under conditions of the type described the variation of surface temperature with time for a variety of surface types proved to be greater than the correction necessitated by path effects. It is concluded that this method of atmospheric correction is unsuitable whenever changes of surface temperature of the order of 1 deg K or more take place within the time span of the data acquisition. (Edited author abstract) 8 refs.

**089960 EVALUATION OF THE STEREOSCOPIC ACCURACY OF THE SPOT SATELLITE.** The SPOT-1 in-flight assessment period for restitution of terrain relief took place from March to November 1986 under the direction of the French Institut Geographique National (IGN). For this purpose, two test regions in the south of France were chosen, and ground control points and check points were selected in these regions before launch of the SPOT satellite. The following process was used: plotting of ground control points, and modeling of SPOT viewing geometry; plotting of check points, and calculation of their restituted positions; and calculation of deviations from the real positions. These operations were performed on a TRASTER/MATRA analytical stereo-plotter using SPOT software compiled by the IGN. The analysis of the results shows that the specifications have been reasonably well met, with restitution accuracies always under 10 meters in planimetry and 7 meters in elevation. (Edited author abstract) 3 refs.

217-221.

**089961 GONIOMETRIC MEASUREMENTS OF A SPRAY-PAINTED BARIUM SULFATE REFERENCE PANEL.** Goniometric measurements of a spray-painted barium sulfate reference panel were made to determine its Lambertian characteristics in the visible and near-infrared (400-1100 nm) range for zenith angles from 0° to 80°. Errors in Lambertian response varied with zenith angle and wavelength and ranged from 0 to 52% in the visible and .03 to 30% in the near-infrared. The non-Lambertian Behavior of a reference panel can cause considerable error when its radiance data is used in the calculation of reflectance factors or in the characterization of irradiance conditions. A technique to correct calculated reflectance factors of field targets collected under clear sky conditions for the non-Lambertian response of a spray-painted barium sulfate reference panel is described. (Author abstract) 8 refs.

**089963 SATELLITE DETECTION OF BLOOM AND PIGMENT DISTRIBUTIONS IN ESTUARIES.** Using a form of vector analysis of satellite spectral data, it is possible to distinguish variations in water color and pigment concentrations from changes in turbidity. In turbid water (reflectance >0.01), the orientation of a spectral vector depends predominantly on organic pigment absorption. Turbidity controls the total reflectance. A reflectance model is developed. The bias and pixel errors combined produce an error of about  $\pm 60\%$ , although bloom composition may produce some additional error. The results indicate that this method can identify blooms in estuaries where the reflectance is between 0.01 and 0.07 and, with some calibration, may provide estimates of chlorophyll for concentrations greater than 5  $\mu\text{g/L}$ . (Edited author abstract) 27 refs.

**089968 DEPENDENCE OF IMAGE GREY VALUES ON TOPOGRAPHY IN SIR-B IMAGES.** This paper focuses on the use of a high resolution digital elevation model (DEM) to aid in rectifying and enhancing synthetic aperture radar images. Using a synthetic backscatter image, the SIR-B images are manually rectified and resampled to remove geometric distortions caused by topography. In a second step, an improved reflectance function of incidence angle is derived from the DEM and the rectified image and this function is used to reduce radiometric effects of topography yielding an albedo image which clearly shows the thematic, as opposed to topographic, content of the image. (Edited author abstract) 8 refs.

**089969 DEMONSTRATION OF STEREOPHOTOGRAMMETRY WITH COMBINED SIR-B AND LANDSAT TM IMAGES.** Shuttle Imaging Radar-B (SIR-B) and Landsat Thematic Mapper (TM) images can be viewed stereoscopically if the illumination geometries

are compatible. To create the stereoscopic effect points must be coregistered. Simplified stereophotogrammetric equations permit the height of an object above a reference plane to be crudely calculated from the target offset toward the SIR-B radar antenna with reference to its position on a TM image. Precision is limited by pixel resolution and target correlation. Future spaceborne imaging radar missions will offer the potential for topographic mapping in many areas where TM coverage is available. (Author abstract) 12 refs.

**089970 EFFECT OF COHERENT SCATTERING IN SPACEBORNE AND AIRBORNE SAR IMAGES.** Radar imagery obtained by the Shuttle Imaging Radar-B (SIR-B) is compared to high resolution aircraft imagery of the same urban and agricultural areas close to the city of Montreal, Canada. It is clear that the SIR-B radar is more sensitive than the aircraft radar to reflections from extended, along-track radar targets. The effect is evident for both urban and agricultural areas in which the street or field orientation is near parallel to the radar azimuth direction. It is likely that such reflectivity enhancement is due to coherent combination of the scattered field from appropriate scattering centers. The paper considers the observed phenomena and probes potential scattering models to explain the results. (Author abstract) 10 refs.

**089971 USE OF VARIOGRAMS IN REMOTE SENSING: I. SCENE MODELS AND SIMULATED IMAGES.** Variograms are the tool used to link models of ground scenes to spatial variation in images. Explicit variograms are calculated for simple models of ground scenes consisting of randomly located discs on a continuous background. By incorporating the effect of the IFOV of the sensor through a process called regularization, explicit variograms for images of these scene models are derived. Verification of the explicit variograms is accomplished by simulating images that match the assumed scene model and sensor parameters and calculating empirical variograms for these images. (Edited author abstract) 27 refs.

**089972 USE OF VARIOGRAMS IN REMOTE SENSING: II. REAL DIGITAL IMAGES.** An improved understanding of the nature and causes of spatial variation in images would provide a basis for the development of new image analysis techniques that use spatial data in more logical ways. Empirically calculated variograms from real digital images demonstrate many of the findings of previous theoretical research using a disc model of scenes and simulated images including: (1) the heights of variograms are related to the density, or proportion of an area covered by objects, (2) the range of influence of a variogram is related to the size of the objects in the scene, and (3) the shape of the variogram becomes more rounded as the variance in the distribution of the sizes of objects increases. In addition, empirically calculated variograms show the periodicity in ground scenes and reveal anisotropy. (Edited author abstract) 6 refs.

**089973 PRESPECTIVE IMAGE FROM THE SPOT-1 HRV SENSOR.** It is now possible to co-register multispectral digital imagery at high spatial resolution with geographical reference data such as DEMs (Digital Elevation Model). These co-registered data sources can therefore be used to generate perspective terrain images. The multispectral imagery often contains information more representative of our visual perception of the ground

surface and therefore has great potential for modeling topography for applications such as landscape assessment and land use planning. An image was generated by registering a SPOT-1 HRV multispectral image to a DEM at a scale of 1:25000. The viewpoint was chosen in order to view vegetational trends along contours and to provide a cross-section across an area of varied relief. The I<sup>2</sup>S System 600 software includes a function which takes a single-band elevation image and a three-band color file, plots a perspective view of an elevation model and colors it. Suitable color inputs might be a multispectral image, topographic or thematic data. The user is able to specify the co-ordinates of the viewpoint (altitude, azimuth and distance), the focus of viewing and the degree of vertical exaggeration. 4 Refs.

**089974 SPOT IMAGE QUALITY. TWENTY MONTHS OF EXPERIENCE.** Since SPOT is an operational and commercial remote sensing system, the quality of the data must be guaranteed during the whole satellite lifetime. Just after launch, during the so-called in-flight assessment period, the raw data quality was analyzed and the parameters for the preprocessing ground-based system were determined. Then, the quality of the preprocessed image was controlled. During the operational period, the quality of the images is periodically analyzed. The evolution of both radiometric and geometric image quality parameters since the SPOT launch is presented and discussed. (Edited author abstract) 7 Refs.

Begni, Gerard (Cent Natl d'Etudes Spatiales, Toulouse, Fr). *Int J Remote Sens* v 9 n 9 Sep 1988 p 1409-1414.

**089975 ESTIMATION OF MULTIPLE REFLECTION AND LOWEST ORDER ADJACENCY EFFECTS ON REMOTELY-SENSED DATA.** The aims of this paper are (i) to investigate the lowest-order adjacency effect and the effect of multiple reflections between the ground and the atmosphere on the Advanced Very High Resolution Radiometer (AVHRR) channel 1 and channel 2 reflectances and on the normalized difference vegetation index (NDVI) and (ii) to make a comparison between global irradiances calculated from two empirical relations, one theoretical and the other experimental. The effect of multiple reflection on each channel reflectance is about 1.2 per cent so that the NDVI is not affected by including a multiple reflection term in the atmospheric correction algorithm. The lowest-order adjacency effect in channel 1 is about 7 per cent and in channel 2 is about 5 per cent and the NDVI changes by about 0.5 per cent which is negligible. These results show that the multiple-reflection and lowest-order adjacency effects can be ignored if one is interested in the NDVI. (Edited author abstract) 11 Refs.

**089976 SPECULAR, DIFFUSE, AND POLARIZED IMAGERY OF AN OAT CANOPY.** Light, polarized by specular reflection, has been found to be an important part of the light scattered by several measured plant canopies. The authors investigate for one canopy the relative importance of specularly reflected sunlight, specularly reflected light from other sources including skylight, and diffusely upwelling light. Polarization images are used to gain increased understanding of the radiation transfer process in a plant canopy. Analysis of the results suggests that properly analyzed polarized remotely sensed data, acquired under specific atmospheric conditions by a specially designed sensor, potentially provide measures of physiological and morphological states of plants in a canopy. 30 refs.

**089977 APPLICATIONS OF MICROWAVES TO REMOTE SENSING.** Extensive theoretical studies as well as laboratory and field measurements of rough-surface scattering and emission from agricultural soil and sea surface and of volume scattering and emission from snow and vegetation yield a considerable comprehension of the interaction of microwaves with the molecular properties and the geometrical features of these media. Hence algorithms have been derived which allow the interpretation of air- and space-borne radiometer- and radar-data in terms of natural parameters. The absorption lines of atmospheric constituents in the millimeter wave range can be utilized to measure with radiometers various trace gases and other parameters, like temperature, throughout the strato- and mesosphere. Knowledge of spectroscopic parameters of the considered molecules, high spectral resolution of the measured lines and special inversion algorithms of the radiation transfer allow the determination of the height distribution of constituents and temperature with a resolution of less than 10 km. (Author abstract) 41 refs.

## Africa

**089978 REMOTE SENSING AND AFRICAN DEVELOPMENT PROGRAMMES.** The objective of this study is to determine the role which remote sensing can play in providing inputs into the solution of the national and regional problems which have affected the African economies the past fifteen years. Limited application of science and the low level of technology have been given among the root causes of Africa's economic problems. Lack of information and data on African member States' natural endowments continue to impede the rate of development of resources. Remote Sensing as a tool to provide the information required for rational planning and development, and control of the environment is discussed. References are made to sub-regional and regional technical co-operation ventures aimed at paving the way for provision of adequate, timely and reliable data for planning. (Edited author abstract). 3 Refs.

**089979 ANALYTICAL FRAMEWORK FOR EXTRAPOLATING EVAPORATION MEASUREMENTS BY REMOTE SENSING SURFACE TEMPERATURE.** By relating horizontal changes in evaporation to horizontal changes in surface temperature an analytical framework is formalized, by which a point measurement of evaporation can be extrapolated from a single area of uniform vegetation to a wider area of mixed vegetation. The assumptions and simplifications implicit in this technique are examined and it is shown that the relationship between the horizontal variation in evaporation and the horizontal variation in surface temperature depends strongly on the aerodynamic transfer resistance and the horizontal variation in air temperature. (Author abstract) 8 refs.

**089980 CANOPY REFLECTANCE OF SEVEN RANGELAND PLANT SPECIES WITH VARIABLE LEAF PUBESCENCE.** Spectroradiometric canopy light reflectance measurements of seven rangeland weed species with variable leaf pubescence characteristics were made at six wavelengths: 0.45, 0.55, 0.65, 0.85, 1.65, and 2.20  $\mu\text{m}$ . The weeds consisted of three species with dense leaf pubescence, two species with sparse pubescence, and two nonpubescent species. Field (biological) measurements were related to spectral measurements of the plant species. Discriminant and factor analysis results showed that

increased reflectance in the visible (0.45-, 0.55-, and 0.65- $\mu\text{m}$ ) wavelengths distinguished dense from sparse and nonpubescent species. (Edited author abstract) 24 refs.

**089981 WHITETAIL DEER FOOD AVAILABILITY MAPS FROM THEMATIC MAPPER DATA.** A map indicating potential food availability for whitetail deer was prepared from 4 Thematic Mapper (TM) data. Land-cover information was derived from the TM data using an unsupervised classification technique, compared with digitized ground truth, and input to a Geographic Information System (GIS) the GIS delineated regions around land covers classified as escape cover, producing a 'distance map.' Relative for values assigned to the classified forage categories when combined with the 'distance map' produced the food availability map. (Edited author abstract) 16 refs.

**089982 INTEGRATING SPHERE TRANSMISSOMETER FOR FIELD MEASUREMENT OF LEAF TRANSMITTANCE.** A simple field-rated transmissometer is described for rapidly determining the normal hemispherical transmittance ( $T(0, 2\pi)$ ) of leaves measured in situ in the four Landsat wavelength bands. The transmissometer requires direct solar illumination of the leaf sample. It collects the transmitted light with an integrating sphere and measures the collected light using a commercially available radiometer. The transmittances determined by the transmissometer are comparable with those measured by a laboratory spectrophotometer with an integrating sphere attachment. (Author abstract) 12 refs.

**089983 CALCULATION OF CANOPY BIDIRECTIONAL REFLECTANCE USING THE MONTE CARLO METHOD.** For a calculation of the plant canopy bidirectional reflectance distribution function (BRDF) the Monte Carlo method is used. The plant architecture is given by a rather universal mathematical model which allows to consider such structural parameters as canopy density and height, the number of leaves per plant, distance between leaves dimensions and orientations of leaves and stems, etc., and their influence on the shape of the BRDF as a function of solar and view directions. To quantify these effects, a series of numerical experiments has been carried out. The information content of the BRDF about canopy architecture is the largest, if it is determined in the principal plane. (Edited author abstract) 22 refs.

**089984 ESTIMATION OF WHEAT CANOPY RESISTANCE USING COMBINED REMOTELY SENSED SPECTRAL REFLECTANCE AND THERMAL OBSERVATIONS.** A procedure is developed for determining actual canopy resistance ( $r_c$ ) from the combined use of remotely sensed spectral reflectance and thermal observations. The procedure entails three basic steps. Attention is focused on establishing a relationship between the resistance and temperature ratios for a wheat canopy by using models to simulate canopy reflectance,  $r_{cm}$ ,  $T_p$ , and  $T_{sm}$ . The modeled relationship is found to be stable for a range of leaf area index values, meteorological conditions, and times of data acquisition and compares favorably with an empirical relationship developed using field data collected over wheat. **089985 SIR-B EXPERIMENTS IN JAPAN. IV. EXPERIMENTAL RESULTS. 2. RICE CROP EXPERIMENT.** Remote sensing of rice fields in Japan was executed using a microwave imaging radar in the SIR-B experiments. Imaging data taken over the Ohgata-mura test site were analyzed to study the microwave backscattering characteristics of rice plants and crop classification. There was a difference in image intensity between the rice fields and the surrounding area. However, we found out no meaningful difference in the image intensity of the rice fields before and after harvest. Also, the correlation between the image intensity and the rice plant conditions was not clear. The investigation of crop classification also gave no significant results. The present results may be mainly attributed to the delay of the experimental term from August to October. (Edited author abstract) 6 refs.

**089986 CANOPY REFLECTANCE OF SOYBEAN AS AFFECTED BY CHRONIC DOSES OF OZONE IN OPEN-TOP FIELD CHAMBERS.** The relationship between canopy reflectance and ozone ( $O_3$ ) treatment was investigated in a field experiment with soybean growing in 3-m diameter, 2.4-m high open-top exposure chambers. The objectives were to develop an understanding of the pattern of reflectance changes induced by this air pollutant and to investigate how these changes might ultimately be related to yield. Correlations were obtained between the reflectance data and visual estimates of non-green leaf area, a widely-used technique for rating pollutant injury. Correlations between the reflectance data and visual estimates of non-green leaf area were high, indicating that rates of senescence could be estimated by either means. (Edited author abstract) 20 refs.

**089987 RADIATIVE SURFACE TEMPERATURES OF THE BURNED AND UNBURNED AREAS IN A TALLGRASS PRAIRIE.** This study was conducted in a natural tallgrass prairie area in the Flint Hills of Kansas. Our objective was to evaluate the surface radiative temperatures of burned and unburned treatments of the grassland as a means of delineating the areas covered by each treatment. Burning is used to remove the senescent vegetation resulting from the previous year's growth. Surface temperatures were obtained in situ and by an airborne scanner. Burned and unburned grass canopies had distinctly different diurnal surface radiative temperatures. Measurements of surface energy balance components revealed a difference in partitioning of the available energy between the two canopies, which resulted in the difference in their measured surface temperatures. The magnitude of this difference is dependent on the time of measurements and topographic conditions. (author abstract) 17 refs.

**089989 MODELLING PLANTING CONFIGURATION AND CANOPY ARCHITECTURE EFFECTS ON DIURNAL LIGHT ABSORPTION CHANGES IN COTTON.** A simplified model that accounts for diurnal solar zenith and azimuth angle illumination changes and plant geometry effects on photosynthetically active radiation (PAR) was developed. Plant growth measurements estimated by the model were significantly correlated with observed measurements during crop development. Model-estimated heliographic leaf elevation trends agreed with published results for cotton canopies. APAR, relative to incident PAR, was generally lower for east-west rows than for north-south rows during crop development. (Edited author abstract) 35 refs.

**089990 ASSESSMENT AND MONITORING OF SPARSELY VEGETATED RANGELANDS USING CALIBRATED LANDSAT DATA.** Measurements of the cover of vegetation were made at a network of 58 permanent 30 ha sites within a semi-arid shrub rangeland from 1981 to 1984. These vegetation data were used to calibrate Landsat data to produce images of 'COVER', a composite variable comprising all the percentage cover of living (shrubs, grass, etc.) and non-living (litter) plant material. The complementary variable was 'BARE' soil (100 - COVER). The regression equations included only Multispectral Scanner band 5 (MSS5) and were used to generate images of COVER for the years 1981, 1982 and 1984 for each of the five major rangeland types within the 25,000 km<sup>2</sup> test area. These COVER images were incorporated into a Geographical Information System (GIS) and used to assess and monitor the behavior of individual rangeland types and pastoral properties over the 1981-1984 period which included a severe drought in 1982-3. (Edited author abstract). 24 Refs.

**089991 CONTINENTAL SCALE VARIABILITY IN VEGETATION REFLECTANCE AND ITS RELATIONSHIP TO CANOPY MORPHOLOGY.** We have measured the spectral canopy reflectance, biomass and projected leaf area index (LAI) of widely-dispersed plots of a North American coastal plant (salt marsh cord grass) in an attempt to identify potential impacts of continental-scale environmental variability on the assumptions underlying remote vegetation analysis. We found that important systematic changes in the canopy geometry and resultant near-infrared reflectance of this plant occurred within its 17° latitudinal range. Continental assessment of biomass using spectral indices would be severely affected by the observed differences. Use of spectral indices to assess more fundamental radiative transfer properties of the canopy, such as projected LAI, is not subject to the observed latitudinal changes, suggesting that large area studies can more reliably address canopy parameters such as adsorbed photosynthetically active radiation. The observed canopy changes also have potential functional consequences for the plant which would be of considerable ecological interest, particularly if similar trends are found for other plants and regions. (Edited author abstract). 33 Refs.

**089992 EVALUATION OF SINGLE-BAND-VIDEO AND VIDEO-BAND-BASED INDICES FOR GRASS-**

**LAND PHYTOMASS ASSESSMENT.** Single-band-video and video-band-based vegetation indices (composite images) were evaluated for their potential to assess phytomass production within grass plots that were fertilized with five rates of nitrogen. Eleven single-band images were acquired by equipping four black-and-white video cameras [three of them visible (0.40 to 0.70  $\mu$ m) and one visible/infrared (IR) (0.40 to 1.1  $\mu$ m) sensitive] with visible and IR narrowband filters. Thirteen vegetation indices were produced on an image processor from the various single-band (composites) images: green/red, IR/blue, IR/green, IR/yellow-green, IR/yellow, IR/orange, IR/orange-red, IR/dark orange-red, IR/red, IR/dark red, IR/deep dark red, normalized difference vegetation index (NDVI), and transformed vegetation index (TVI). Digital data were obtained from the 24 images and regressed on amounts of phytomass. (Edited author abstract). 25 Refs.

**089993 CHARACTERIZATION OF VEGETATION WITH COMBINED THEMATIC MAPPER (TM) AND SHUTTLE IMAGING RADAR (SIR-B) IMAGE DATA.** Based on TM and SIR-B image data for Fresno County, California, in October 1984, we found that the sensors provided quantitative information on the amounts of herbaceous and woody vegetation in a given field. Optical reflectance spectra responded primarily to green, foliar biomass, and L-band (23-cm) backscattering coefficients related primarily to standing, woody biomass. A simple progressive transformation of the concatenated spectra produced three continuous measures of biophysical condition, F<sub>1</sub>, F<sub>2</sub>, and F<sub>4</sub>. These indicated the percent ground cover, the green leaf-area index (or standing green biomass per unit area), and the woody biomass per unit area, respectively. (Author abstract). 12 Refs.

**089994 THE DERIVATION OF GLOBAL ESTIMATES FROM A CONFUSION MATRIX.** This letter suggests a way in which a confusion matrix can be used to correct image classification results to provide estimates of area statistics under different cover types. The matrix is commonly used in three ways. First, it is used to estimate the overall accuracy (or consistency with ground data) of the classification technique. Second, it is used to identify the specific errors affecting individual categories. Third, it is used to measure the extent to which the interpretation technique over- or underestimates a particular category and may therefore be used to adjust values obtained by the classification method to yield global estimates for an image. This letter proposes an alternative approach to this third use. The method has been conceived in the context of agricultural land cover categories classified on satellite sensor data but has a much wider potential relevance to many other cover mapping and estimating problems in remote sensing. (Edited author abstract). 4 Refs.

**089996 EFFECTS OF SOIL MOISTURE, SURFACE ROUGHNESS, AND VEGETATION ON L-BAND EMISSION AND BACKSCATTER.** Measurements with Shuttle Imaging Radar B (SIR-B) at 1.28 GHz and an airborne multiple-beam push-broom radiometer at 1.4 GHz were made over a number of agricultural fields near Fresno, California during October 7-10, 1984. These measurements provided a unique data set for studies of microwave emission and backscatter from surfaces of various characteristics. The effects of surface roughness and vegetation (alfalfa and lettuce) were analyzed with respect to the responses of microwave emission and backscatter to soil-moisture variations. A theoretical model (Kirchhoff approximation) was used to assess these effects. It was found that for microwave emission, the effect of surface roughness is less significant compared to that of vegetation. However, the surface roughness was shown to play a dominant role compared to the vegetation cover in the microwave backscatter. The two roughness parameters in the theoretical model calculations were the surface correlation length and the standard deviation of surface height. These parameters were found to be affected strongly by the soil-texture effect in the emissivity calculations. A disagreement was found between the calculated and the observed scattering coefficients if the measured surface correlation length and standard deviation of surface height were input to the model. 27 refs.

**089997 DETECTION AND IDENTIFICATION OF ARCTIC LANDFORMS: AN ASSESSMENT OF REMOTELY SENSED DATA.** The capabilities of remote sensing data to detect landforms on the Arctic Coastal Plain of northern Alaska were investigated. The detection and identification of thaw lakes, drained lake basins, polygonal ground patterns, pingos, eolian dunes, and drainages were assessed with both airborne and satellite-acquired data. The data included Landsat Multispectral Scanner (MSS), Thematic Mapper Simulated (TMS), NS001 (similar to multispectral SPOT), Seasat, and airborne radar. The remote sensing data were digitally enhanced and compared to baseline geomorphic maps derived from aerial photography. Generally, more landforms were detected and recognized from analysis of the multispectral images than radar images because of the sensitivity of visible and infrared wavelengths to differences in vegetation and soil moisture. (Edited author abstract) 11 refs.

## Australia

**089999 SIR-B STEREO-RADARGRAMMETRY OF AUSTRALIA.** We report on further results of an ongoing program of radargrammetric experimentation with Space Shuttle Imaging Radar (SIR-B) data. Six stereo models of orbits over Australia were processed in an analytical stereo plotter. Height accuracies were up to  $\pm 25$  m or 1.8 times the range resolution. This is better than in previous SIR-B stereo work, probably due to better image quality. Some inconsistencies were encountered between look angle geometries and height measurement accuracies. While general observations about earlier SIR-B stereo results were confirmed, inconsistencies with theoretical expectations could not be fully explained. (Edited author abstract) 10 refs.

**090000 SIMULATIONS OF DATA COMPRESSION OF SATELLITE GEOPHYSICAL DATA.** Data compression techniques are frequently discussed for data which are in the form of images. Some forms of geophysical data can be considered as matrices, similar to images. Results are shown of the effectiveness of several compression techniques on data from the plasma wave experiments flown on three scientific satellites. The use of actual data shows that an average telemetry bandwidth saving of a factor of two or three can be achieved without serious degradation. This saving can be used to increase the data quality, usually by way of improved resolution (either spectral or spatial), when regions of scientific interest are encountered. **090001 EXPERT SYSTEMS AND SPATIAL DATA MODELS FOR EFFICIENT GEOGRAPHIC DATA HANDLING.** Existing geographic information systems need to be more flexible and efficient to effectively handle large quantities of spatial data acquired by remote sensing systems and from conventional map sources. Partial solutions to this problem may come from the implementation of improved spatial data models in expert systems. It is suggested that expert systems offer possibilities for making geographic information systems more efficient and user-friendly. Improved spatial data models for expert geographic information systems include hierarchical tessellation models. Research is suggested to determine the most appropriate spatial data model. **090003 REMOTE SENSING AND GEOGRAPHIC INFORMATION SYSTEM TECHNIQUES FOR AQUATIC RESOURCE EVALUATION.** The spread of aquatic plants in Lake Marion, South Carolina, necessitated an assessment of the trends in vegetation growth and water quality. Aquatic vegetation maps at 1:10,000 and 1:24,000 scale were produced by photogrammetric techniques from color infrared aerial photographs recorded on six dates between 1972 and 1985. These and other vector map products depicting bathymetry and herbicide applications were converted to raster format (25-m grid cells) to form a cartographic database for the 170 km<sup>2</sup> study area. Statistical data on nutrients, dissolved oxygen, biological oxygen demand, and turbidity obtained from South Carolina Department of Health and Environmental Control and U.S. Environmental Protection Agency records were also input to the database. A PC-based GIS was then used to relate macrophyte distributions to environmental factors influencing aquatic plant growth. (Edited author abstract) 15 refs.

**090004 REMOTE SENSING: THE UNHERALDED COMPONENT OF GEOGRAPHIC INFORMATION SYSTEMS.** The integration of descriptive and statistical data into computer based management information systems (MIS), and the subsequent planning model development utilizing operations research techniques, set the stage and provided the rationale for the establishment and maintenance of natural resource information systems as an integral part of the management function. Generally considered a product before its time, digital image processing languished as an operational tool while the supporting technologies of digital mapping and database management combined with MISs already in place to form the basis of computer-aided geographic information systems (GIS). The introduction of SPOT satellite data in the mid-80s with resolutions and capabilities more compatible with on-going GISs, and the explosive development of microcomputer technology, has provided a unique opportunity to reintroduce digital imagery. **090006 DERIVATION OF VEGETATION INDICES FROM AVHRR DATA.** The reliability of a 1-week composited normalized difference vegetation index has been evaluated by using a cloud-screening algorithm applied to the visible and near-infrared data from the Advanced Very High Resolution Radiometer on NOAA-9. It is found that in some areas of the U.S. Great Plains this satellite sensor product may not be reliable due

to the high frequency of cloud occurrence. Using the example of day-to-day variation in the observed clear-sky radiances for one target, the vegetation index is shown to have maxima at high off-nadir and low solar zenith angles; this behavior has been examined in detail. Some recommendations to improve the compositing technique are given. (Author abstract) 17 refs.

**090007 GEOBOTANICAL INVESTIGATION BASED ON LINEAR DISCRIMINANT AND PROFILE ANALYSES OF AIRBORNE THEMATIC MAPPER SIMULATOR DATA.** This paper discusses the application of linear discriminant and profile analyses to detailed investigation of an airborne Thematic Mapper Simulator (TMS) image collected over a geobotanical test site. This investigation was specifically concerned with the exploitation of premature leaf senescence as an indicator of geobotanical stress. Senescence is a natural and normal aging process which occurs in leaf tissue prior to abscission from the plant. It is found that changes in canopy reflectance and thermal emittance of the deciduous flora overlying geochemically anomalous areas are consistent with the biophysical changes which are known or presumed to occur as a result of injury induced in metal-stressed vegetation. 24 refs.

**090008 FRESNEL FIELD INTERACTION APPLIED TO SCATTERING FROM A VEGETATION LAYER.** Models for scattering from a vegetation layer treated as a collection of discrete scatterers usually assume far field interaction among scatterers. In a real vegetation medium such as a deciduous forest or a soybean field it is not always true that each leaf is in the far field of other leaves. This paper examines the additional effect when scatterers are permitted to be in the Fresnel zone of one another. Both disc-shaped and needle-shaped leaves are considered. It is found that in general this causes the backscattering coefficient to be lower for the disc-shaped leaves and may be higher or lower for the needle-shaped leaves depending upon polarization, incidence angle, and frequency than those computed under the assumption of conventional far field interaction. (Author abstract) 12 refs.

**090009 EVALUATION OF SATELLITE DERIVED LAND COVER CHARACTERISTICS FOR GLOBAL CLIMATE MODELLING.** A preliminary evaluation of the suitability of a currently operational satellite data archive, namely the NOAA global vegetation index (GVI) product, as a basis for providing information on land cover characteristics for global climate modelling has been undertaken by comparing it to several existing data bases of soil and vegetation cover. It is found that temporal composites of GVI values often continue to change beyond the accepted compositing period of three or four weeks. In extreme cases the addition of another week to the compositing period changes over 90% of the pixels. Selection of GVI class boundaries is found to be rather hard and is probably a strong function of the classification technique employed. The resulting GVI classes are generally explicable by reference to other archival material although this study identifies some specific cases of locational divergence from 'consensus' classification. Additional aspects of the subject are discussed. (Edited author abstract) 53 refs.

**090010 RELATIVE SENSITIVITY OF NORMALIZED DIFFERENCE VEGETATION INDEX (NDVI) AND MICROWAVE POLARIZATION DIFFERENCE INDEX (MPDI) FOR VEGETATION AND DESERTIFICATION MONITORING.** Assuming a simple form for the relationship, a simple equation relating MPDI (Microwave Polarization Difference Index) and NDVI (Normalized Difference Vegetation Index) was derived. Comparing with actual data from Nimbus 7/SMMR at 37 GHz and NOAA/AVHRR, Channels 1 and 2, the proposed formula represents correctly the general tendency of data. It is then shown that there exists a limit characteristic of a particular type of cover which has to be analyzed, given by  $NDVI = 0.13 \pm 0.02$ , for which both indices are equally sensitive to the variation of vegetation, and below which MPDI is more efficient than NDVI. The scatter of the data around the theoretical curve obtained is briefly analyzed. It is suggested that, despite the dispersion due to the processing itself, this spreading could give some insight into the relationship between water content and chlorophyll absorption at pixel size scales. **090011 ESTIMATING SURFACE SOIL MOISTURE FROM SATELLITE MICROWAVE MEASUREMENTS AND A SATELLITE DERIVED VEGETATION INDEX.** Normalized 18 GHz microwave brightness temperatures ( $T_B$ ) and a vegetation index were calculated from satellite radiometer data, and subsequently used in conjunction with climatically modeled surface moisture estimates to calibrate a simple physically based soil moisture model. Test sites within the U.S. Southern Great Plains were chosen for their range of climatic conditions from east to west. Normalized  $T_B$  values correlated well with soil moisture when the data were segregated by vegetation index range, but less so when all data were combined. With the introduction of a vegetation index parameter, the model accounted for approximately 70% of the variability in modeled surface soil moisture. (Edited author abstract) 33 refs.

**090012 MICROWAVE VEGETATION INDEX: A NEW LONG-TERM GLOBAL DATA SET FOR BIOSPHERIC STUDIES.** The feasibility of monitoring regional and global vegetation using visible and near-infrared reflectance observations by AVHRR on board NOAA satellites has been demonstrated. The difference of vertically and horizontally polarized brightness temperatures ( $\Delta T$ ) at 37 GHz frequency (wavelength about 8 mm) of the scanning multichannel microwave radiometer (SMMR) on board the Nimbus-7 satellite has been processed as monthly composites of global observations from January 1979 to December 1985. The major factor determining the magnitude of  $\Delta T$  are scattering and absorption of microwave radiation by the vegetation, but one could also see the effects of surface roughness, open water (lakes and rivers) and snow cover on the observations. The  $\Delta T$  data have been found to be highly correlated with the normalized difference vegetation index derived from AVHRR, rainfall and drought over the Sahel, seasonal variation of atmospheric  $CO_2$  concentration at Mauna Loa, land surface evaporation and primary productivity over hot arid and semi-arid regions of Africa and Australia. 3 refs.

Choudhury, Bhaskar J. *Int J Remote Sens* v 9 n 2 Feb 1988 p 185-186.

**090013 SIMULATION OF SOLAR ZENITH ANGLE EFFECT ON GLOBAL VEGETATION INDEX (GVI) DATA.** The aim of this paper is to investigate the effect of solar zenith angle on the normalized difference vegetation index (NDVI) derived from the Advanced Very High Resolution Radiometer (AVHRR) channel 1 (red) and channel 2 (near-infrared) data. The NDVI as a function of solar zenith angle are simulated for a

nadir-looking sensor. Simulation is essentially the inverse of atmospheric correction of remotely-sensed data. Calculations are made for the four surface cover types, namely, the high, moderate and low green-leaf vegetation densities and bare soils. The results show that the NDVI for bare soil remains constant for solar zenith angles up to about 60°, then decreases for solar zenith angles above this. (Edited author abstract) 10 refs.

**090014 RADIOMETRIC LEAF AREA INDEX.** The aim of this study was to develop a practical measure of vegetation amount that was sensitive to canopy geometry. This measure was termed the radiometric leaf area index (RLAI) and comprised measurements of leaf area index (LAI), leaf inclination or curvature and the area of the canopy visible to the sensor. RLAI, evaluated on simulated and laboratory-derived data, was sensitive to canopy geometry but, like LAI, suffered from a high measurement error. (Edited author abstract) 55 refs.

**090015 EFFECT OF MEASUREMENT ERROR AND CONFUSION FROM VEGETATION ON PASSIVE MICROWAVE ESTIMATES OF SOIL MOISTURE.** When using passive microwave sensors to estimate soil moisture it is important to understand the sensitivity of the estimate to (1) the effects of confusion due to surface roughness and vegetation and (2) the effect of measurement error due to noise. The sensitivity of error in soil moisture estimates to passive microwave measurement error as a function of vegetation is presented using a simple model and measurements. Roughness confusion is not considered. The direct problem is defined as investigating the sensor response as the dependent variable to the parameter of interest while the inverse problem uses the parameter of interest as the dependent variable. The inverse method must be used for operational remote sensing applications. (Edited author abstract) 10 refs.

**090017 DIFFERENCES IN VISIBLE AND NEAR-IR RESPONSES, AND DERIVED VEGETATION INDICES, FOR THE NOAA-9 AND NOAA-10 AVHRRs: A CASE STUDY.** This study evaluates the differences in the visible and near-IR responses of the Advanced Very High Resolution Radiometers (AVHRR) of the National Oceanic and Atmospheric Administration (NOAA)-9 and -10 satellites for coincident sample locations. The study also evaluates the differences in vegetation indices computed from those data. The data were calibrated to reflectance values with coefficients supplied by NOAA. The visible and near-IR reflectance values and the derived vegetation index values of the NOAA-9 AVHRR were usually greater than those of the NOAA-10. Visible and near-IR reflectance values exhibited trends that appeared to be related to the satellite scan angles at the examined sample locations. Linear relationships were developed between the vegetation indices of the two systems. The vegetation index values for the NOAA-9

and NOAA-10 AVHRR displayed nearly constant differences for a variety of surface features. The results suggest that, with appropriate gain and offset, the vegetation indices of the two sensor systems may be interchangeable for assessment of land surfaces. (Edited author abstract) 26 refs.

**090018 REFLECTANCE SPECTRA OF SUBARCTIC LICHENS.** Lichens constitute a major portion of the ground cover of high latitude environments, but little has been reported concerning their in situ solar spectral reflectance properties. Knowledge of these properties is important for the interpretation of remotely sensed observations from high latitude regions, as well as in studies of high latitude ecology and energy balance climatology. The spectral reflectance of common boreal vascular plants is similar to that of vascular plants of the midlatitudes. The dominant lichens, in contrast, display variable reflectance patterns in visible wavelengths. The relative reflectance peak at 0.55  $\mu m$ , common to green vegetation, is absent or indistinct in spectra of pervasive boreal forest and tundra lichens, despite the presence of chlorophyll in the inner algal cells. (Edited author abstract) 26 refs.

**090019 USE OF DIGITAL TERRAIN DATA IN THE INTERPRETATION OF SPOT-1 HRV MULTISPECTRAL IMAGERY.** This paper describes the complementary use of digital terrain information and SPOT-1 HRV multispectral imagery for the study and mapping of semi-natural upland vegetation. A digital terrain model was derived for a 10 by 10 km study area in southern Snowdonia, Wales, and was used to generate slope and aspect images. A model was developed as a first-order approximation of changes in radiance with local topography, assuming Lambertian behavior of vegetation canopies. The model was implemented for the study area to assess its use in suppressing the effects of relief on scene radiance. Subsequently the model was refined to describe non-Lambertian reflectance. (Author abstract) 14 refs.

**090020 SATELLITE DATA AND GEOGRAPHIC INFORMATION SYSTEM FOR LAND USE CLASSIFICATION.** Landsat Multispectral Scanner System (MSS) data in conjunction with the unsupervised classification technique of Earth Resources Laboratory Application Software (ELAS) were used to determine land use/land cover classifications. The Landsat computer compatible tapes (CCT) for February 9, 1976 were analyzed to spectrally classify unique land use/land cover conditions within the Econlockhatchee (Econ) River basin, Florida. The results showed that the scatter diagrams of Band 4 (0.5-0.6  $\mu m$ )-Band 7 (0.8-1.1  $\mu m$ ) and Band 4-Band 6 (0.7-0.8  $\mu m$ ) can be utilized as well as the traditional Band 5 (0.6-0.7  $\mu m$ )-Band 7 scatter diagram approach for classifying land use/land cover. Both the zoom transfer scope and the geographic information system have been demonstrated to be very useful tools for land use/land cover classification of Landsat data. **090021 ESTIMATING SOIL WETNESS USING SATELLITE DATA.** Improved estimates of soil wetness were obtained using observations from both the NIMBUS-7 Scanning Multichannel Microwave Radiometer (SMMR) and the NOAA-7 Advanced Very High Resolution Radiometer (AVHRR). SMMR 6.6 GHz frequency, horizontal polarization, brightness temperature ( $T_{BH}$ )

was first correlated with soil wetness, as computed using an Antecedent Precipitation Index (API) model, for a number of SMMR ground resolution areas involving a fairly wide range of vegetation densities. Linear regression results were used to develop a diagnostic model for soil wetness using SMMR and AVHRR data only. The model was found to be useful in describing four levels of soil wetness as compared to three levels when vegetation was not considered. (Edited author abstract). 4 Refs.

**090022 THEORETICAL ESTIMATE OF TROPOSPHERIC WATER VAPOUR ATTENUATION AT 94GHz FROM RADIOSONDE DATA.** The attenuation of millimetre wave bands at the atmospheric window at 94 GHz originates mainly from water vapor, while the oxygen attenuation exhibits a minimum at this window. A theoretical estimate of the water vapor attenuation has been made from the radiosonde data during the MONEX (Monsoon Experiment) period by the India Meteorological Department. A monomer model is assumed here and the theoretical spectral line equation given by Croom, for water vapor, has been utilized to estimate the contribution of two adjacent water vapor lines (at 22.235 and 183.311 GHz) to the 94 GHz attenuation by an extrapolation technique. The results are discussed in the light of current knowledge of water vapor attenuation at millimetre wave bands. (Author abstract). 15 Refs.

**090023 CLOUD COVER DISTRIBUTION IN INDONESIA.** Indonesian spatio-temporal cloud cover distribution was quantified to allow planners to forecast probabilities for remote sensing data acquisition. The original data consisted of four randomly chosen Geostationary Meteorological Satellite displays per month from 1981 to 1985, which were analyzed with a microcomputer after a 1° 15' pixel size digitization. Iterative interactive factorial analyses combined with a parallelepiped classifier clustered data by grouping pixels with similar profiles. For all classes, pixel profiles were linearly combined to provide a small number of classes with high pixel-class correlations. A 0.7 correlation threshold led to 18 classes for all land areas. Statistics of Landsat and SPOT images, grouped by class, were used to verify, calibrate and improve class profiles. This led to quantified temporal profiles of probability of acquiring remotely-sensed data with a given cloud cover percentage for any Indonesian land and marine area. (Author abstract). 5 Refs.

Gastellu-Etchegorry, J.P. (Gadjah Mada Univ, Yogyakarta, Indonesia). *Int J Remote Sens* v 9 n 7 Jul 1988 p 1267-1276.

**090024 PREDICTIVE MODELS FOR REMOTELY-SENSED DATA ACQUISITION IN INDONESIA.** Indonesian spatio-temporal cloud cover distribution was quantified with the aid of Geostationary Meteorological Satellite (GMS) and Landsat data. For all land areas iterative interactive factorial analyses grouped GMS-derived pixels with similar cloud cover profiles into 18 classes. Statistics of Landsat and SPOT images, grouped by class, were used to quantify temporal profiles of probability of acquiring remotely-sensed data with 10 per cent, 20 per cent and 30 per cent cloud cover for any Indonesian land area. Analysis of the spatio-temporal characteristics of local climatic conditions permitted one to explain these profiles and to verify the validity of their seasonal variations for long periods. These profiles were fitted with a seventh-order polynomial for use in computer simulation of predictive models of remotely-sensed data acquisition. (Author abstract). 10 Refs.

Gastellu-Etchegorry, J.P. (Gadjah Mada Univ, Yogyakarta, Indonesia). *Int J Remote Sens* v 9 n 7 Jul 1988 p 1277-1294.

**090025 AIRBORNE LASER PROFILE DATA FOR MEASURING EPHEMERAL GULLY EROSION.** The feasibility of using airborne laser measurements of surface heights as a method for providing information on ephemeral gully erosion was investigated. Laser profile data were obtained over control fields with both artificial and natural gullies and recorded at 4000 pulses per second at a nominal aircraft speed of 25 meters per second and altitudes of 50 and 100 meters. A moving average filter was used to remove random noise and surface microroughness effects. Analysis of the data from the artificial and natural gully fields clearly indicated the location and cross section of gullies as small as 50 cm wide and 15 cm deep. These results demonstrated the feasibility of the approach because the tested conditions were what would be considered very small gullies. (Edited author abstract). 10 Refs.

**090026 COMPOSITE L-B AND HH RADAR BACKSCATTERING MODEL FOR CONIFEROUS FOREST STANDS.** The radar backscattering model developed by J.A. Richards et al. (1987) has been improved and further tested in this research. The trunk term may now be calculated from the exact solution to the electromagnetic wave equations instead of the corner reflector equation. Rough surface models have been introduced into the radar model, so that the forward reflectance and the backscattering from the ground surface are now calculated from the same model and, thus, are consistent. The simulated results show that the match of backscattering coefficients for eight forest stands between SIR-B image data and the simulated results are satisfying, and that the trunk term now seems to be convincingly established as the dominant term in the L-band HH radar return from coniferous forest stands. (Edited author abstract). 15 Refs.

**090027 APPLICABILITIES OF IMAGING RADAR FOR CLASSIFICATION OF FOREST VEGETATION.** This paper reviews woodland and agricultural aspects of land use, based on the author's experience with SEASAT-SAR, SAR-580 and SIR-B imagery. It presents potential applications as well as the limitations of the microwave remote sensing sensor for operational tasks of land-use inventory. The exclusive use of radar in woodland applications is only conceivable in cases where immediate information might be essential (e.g. forest fires, floods). Present potential use of microwave remote sensing for practical purposes is characterized by a close cooperation between radar as a 'first look instrument' and other inventory procedures (e.g. aerial photography), which work in a more detailed way. The advantage of microwave sensing is its independence of weather and illumination. (Edited author abstract). 16 Refs.

Kessler, Ralf (Univ of Freiburg, Freiburg, West Ger). *Photogrammetria* v 41 n 4 Sep 1987 p 221-232.

**090028 TRANSPORTABLE HEMISPHERICAL ILLUMINATION SYSTEM FOR MAKING REFLECTANCE FACTOR MEASUREMENTS.** An artificial source of stable, hemispherical illumination has been developed to facilitate the collection of reflectance factor measurements of targets of interest in a laboratory environment. The light source consists of a 76 cm (30 in.) aluminum hemisphere which has been coated internally with barium sulfate paint. Illumination is provided by two banks of lamps, each consisting of eight 62-W quartz halogen bulbs which have tungsten filaments. An internal baffle precludes the viewing of any direct beam of light. A

simple metal structure has been developed to hold the hemisphere and all peripheral equipment, such as spectrometers, radiometers, and cameras, in place during data collection. The entire set up can be easily disassembled and packed in airline approved shipping cases to facilitate transportation to remote laboratory facilities. (Edited author abstract). 10 Refs.

**090029 POTENTIAL APPLICATIONS OF DIGITAL IMAGE ANALYSIS SYSTEMS FOR DISPLAYING SATELLITE ALTIMETRY DATA.** DIPIX ARLES II and a Perceptron EASI/PACE digital image analysis systems were used for displaying geoidal and sea-surface heights. These data sets were transferred to image files for display. Black-and-white and color density slicing, and enhanced color display techniques were employed to better visualize these surfaces. An analytical relief shading program was developed to make the small local undulations in height visible. The shape and orientation of the various surfaces were compared by a differencing program specifically written for this purpose. The processing and display techniques employed offered additional capabilities in examining and interpreting the displayed surfaces. (Edited author abstract). 10 Refs.

Yazdani, Rostam (Univ of New Brunswick, Fredericton, NB, Can); Christou, Nikolaos; Derenyi, Eugene. *Photogramm Eng Remote Sens* v 53 n 11 Nov 1987 p 1545-1548.

**090030 MEASUREMENTS OF THE BACKSCATTER AND ATTENUATION PROPERTIES OF FOREST STANDS AT X-, C- AND L-BAND.** The new airborne multiband scatterometer (DUTSCAT) promises to be a useful tool for research in the field of active microwave remote sensing. An evaluation of the use of this system for research in forestry is given. Besides accurate  $\sigma^0$  values, the system can acquire information on the vertical distribution of backscattering. Through inversion of the multilevel model,  $\sigma^0$  can be divided in contributions from a number of layers (three or four). An experiment with large corner reflectors placed on the forest floor was conducted in an effort to gain more insight into the attenuating properties of the forest canopy. The measurements of attenuation properties together with the division of  $\sigma^0$  in contributions from several layers simplifies the model-construction effort considerably. (Author abstract). 8 Refs.

**090031 EXPLORATION OF CRUSTAL/MANTLE MATERIAL FOR THE EARTH AND MOON USING REFLECTANCE SPECTROSCOPY.** Near-infrared reflectance spectra have been acquired (a) for Moses Rock diatreme in SE Utah using an airborne imaging spectrometer (AIS) and (b) for small areas in and around the large lunar impact crater Copernicus using spectrometer on earth-based telescopes. The high spectral resolution and precision of these data allow several mineral components of surface material to be identified and analyzed in a spatial context. The derived mineralogical information is used to address specific geological problems. For the terrestrial study, the distribution of the measured abundance of mantle-derived ultramafic microbreccia across Moses Rock dike indicates that flow stabilized into a few channels during the violent eruption. (Edited author abstract). 52 Refs.

Pieters, Carle M. (Brown Univ, Providence, RI, USA); Mustard, John F. *Remote Sens Environ* v 24 n 1 Feb 1988 p 151-178.

**090032 AIS RADIOMETRY AND THE PROBLEM OF CONTAMINATION FROM MIXED SPECTRAL ORDERS.** Airborne Imaging Spectrometer data from Mono Lake, CA, are studied in order to establish the spectral radiance of test areas under solar illumination. The objective is to provide a method of atmospheric correction for major absorbers from the spectrometer data themselves. Crucial to the analysis is radiometric calibration of the instrument. Good agreement is found between calculated and measured radiances for uniform surface targets (beaches), but simulations of atmospheric properties with LOWTRAN 6 lead to unreasonably low values of atmospheric precipitable water. Absorptions from carbon dioxide are not detected in the AIS data, but are strongly present in the LOWTRAN 6 model. The apparent low contrast of all atmospheric absorption bands leads to a study of contamination from overlapping spectral orders in the AIS data. (Edited author abstract) 18 refs.

**090033 SELECTING THE SPATIAL RESOLUTION OF SATELLITE SENSORS REQUIRED FOR GLOBAL MONITORING OF LAND TRANSFORMATIONS.** The spatial resolutions of the next generation of sensors for the global monitoring of vegetation is assessed with particular reference to the proposed Moderate Resolution Imaging Spectrometer (MODIS). The main innovative use of such instruments will lie in their ability to monitor land transformations at global and continental scales. Reliable monitoring is shown to rely on the success with which the changes in the phenomena being analyzed can be separated from other temporal changes. Depending on the type of spatial change being monitored, sensor properties such as accuracy of registration, resolution and radiometric sensitivity are shown to have greatest importance. (Edited author abstract) 46 refs.

**090034 INTEGRATED CAMERA AND RADIOMETER FOR AERIAL MONITORING OF VEGETATION.** The design requirements for a broad-band red and near infrared radiometer for monitoring vegetation from a light aircraft are discussed and an instrument which incorporates these characteristics, called an integrated camera and radiometer (ICAR), is described. It consists of two downward-looking, spectral radiometers and a solar radiometer coupled with a 35 mm camera and a data-logger in a convenient payload for mounting in a light aircraft. The distinctive features of the ICAR are the synchronization of the camera and radiometers, the equivalence and acts as a programmable data-logger. (Edited author abstract) 24 refs.

**090035 TWO ADAPTIVE FILTERS FOR SPECKLE REDUCTION IN SAR IMAGES BY USING THE VARIANCE RATIO.** This paper presents some experimental results on the properties of image speckle along with two adaptive filters that are useful for speckle reduction. An investigation of available SIR-B digital image data over Australia shows that speckle is non-white Gaussian noise and fits a multiplicative noise model in which the noise, uncorrelated with signal, has a mean of 1 and a constant standard deviation. The non-uniform spectrum can be represented by an empirical formula. Based on these results, two adaptive filters have been designed, a moving average filter and a combined moving median filter. (Edited author abstract) 28 refs.

**090036 DETERMINATION OF THE VERTICAL PATTERN OF THE SIR-B ANTENNA.** Determination of the antenna pattern is important for a spaceborne

Synthetic Aperture Radar such as Shuttle Imaging Radar-B (SIR-B). For SIR-B the antenna was so large that apart from one section, no complete pattern could be measured on the ground. Attempts were made to measure the pattern while the shuttle was in space by using ground receivers and active radar calibrators. The method used and described is a supplement to these measurements. The vertical pattern of an antenna can be extracted from radar signals returned from regions whose scattering coefficients versus incidence angle characteristics are suitably flat and uniform. The method used here shows that the main vertical lobe of the SIR-B antenna is slightly wider than previously reported. (Edited author abstract) 7 refs.

**090037 RADIOMETRIC CALIBRATION ANALYSIS OF SIR-B IMAGERY.** The second flight of the NASA Spaceborne Imaging Radar (SIR-B) collected nearly 8 hours of digital synthetic-aperture radar (SAR) data of the Earth's surface. This paper analyzes the performance of the SAR to determine the accuracy of the relative radiometric calibration of these data. Procedures are presented for deriving accuracy estimates as well as limitations under which these estimates are valid. The impact on calibration of an RF breakdown in the primary antenna feed system cable is evaluated. An analysis of the platform stability based on the SAR echo data is also presented in conjunction with its resultant effect on the calibration accuracy. Finally, numerical error bounds are derived with guidelines on their utilization. (Author abstract) 24 refs.

**090038 COMPARATIVE EVALUATION OF THE LARGE FORMAT CAMERA, METRIC CAMERA, AND SHUTTLE IMAGING RADAR-A DATA CONTENT.** Large Format Camera (LFC) photography, Metric Camera (MC) photography, and Shuttle Imaging Radar-A (SIR-A) data were evaluated on their thematic contents in satisfying the requirements for topographic mapping at 1:100,000 scale. The study area of Mobile, Alabama-Pensacola, Florida was selected because of the availability of these three types of images. It was found that the LFC photography, while suffering from geometric inaccuracy due to its use of forward motion compensation and a 23 by 46-cm format, provided nearly complete areal features and a sufficient amount of linear features for topographic mapping. (Edited author abstract) 12 refs.

**090039 PROCEDURES FOR USING SIGNALS FROM ONE SENSOR AS SUBSTITUTES FOR SIGNALS OF ANOTHER.** Long-term monitoring of surface conditions may require a transfer from using data from one satellite sensor to data from a different sensor having different spectral characteristics. Two general procedures for spectral signal substitution are described in this paper, a principal-components procedure and a complete multivariate regression procedure. They are evaluated through a simulation study of five satellite sensors (MSS, TM, AVHRR, CZCS, and HRV). For illustration, they are compared to another recently described procedure for relating AVHRR and MSS signals. The multivariate regression procedure is shown to be best. TM can accurately emulate the other sensors, but they, on the other hand, have difficulty in accurately emulating its shortwave infrared bands (TM5 and TM7). (Author abstract) 6 Refs.

**090040 NAVIGATION OF AVHRR IMAGERY.** The NOAA series of satellites are launched in almost circular, Sun-synchronous polar orbits at an altitude of about 850

km above Earth. One of the most important instruments on board these satellites is the Advanced Very High Resolution Radiometer (AVHRR) whose data is transmitted to ground along with much other data using the spacecraft's High Resolution Picture Transmission Link. The method described is designed to work at any time after data reception, i.e. it can be used to navigate imagery which has been achieved. It can be used with sectorized images and essentially the technique described provides an overlay which under program control merges with the image to produce an accurately gridded product on a photo-facsimile machine. 7 Refs.

**090042 VERY ACCURATE C-BAND NOISE SCATTEROMETER/RADIOMETER SYSTEM.** A combined noise scatterometer/radiometer operating in the C-band is described. The radiometer is of the noise-injection type, achieving a high degree of accuracy and stability (better than 0.5 deg K). The noise scatterometer is based on design techniques normally only found in the realm of radiometers, and, through this, extraordinary stability is ensured (better than 0.03 dB). The instrument is intended for precise comparison of brightness temperatures and backscatter coefficients. (Author abstract) 5 refs.

**090043 SINGLE-SOURCE THREE-DIMENSIONAL IMAGING SYSTEM FOR REMOTE SENSING.** A recent development in three-dimensional imaging is the application of VISIDEP technology to surveillance and reconnaissance. The results of efforts to develop a single-source system using a moving platform are reported. These tests demonstrate the feasibility of such a system. Although film was used to achieve the present results, electronic imaging can be used to generate near-real-time three-dimensional video images with delays of less than 3 s. With the continued development of high density video and digital imaging, improved image resolution is achievable. The theoretical basis, testing results, and projections for future development are presented. Potential applications and expectations are discussed. (Edited author abstract) 21 refs.

**090044 APPLICATION OF PERCEPTUAL COLOR SPACES TO THE DISPLAY OF REMOTELY SENSED IMAGERY.** An attempt is made to show how perceptually uniform color spaces can improve significantly the interpretability of displays and remotely sensed geoscientific imagery. A computational framework encompassing the mapping of data into perceptually uniform color spaces is presented, and practical application of this framework to various types of geophysical data is described. Applications include the depiction of informative data variables in specified lightness and saturation

ranges, the effective utilization of chromatic contrast in multispectral data displays, and representations of more complex integrated data sets. 32 refs.

**090045 OBJECT-ORIENTED FEATURE EXTRACTION METHOD FOR IMAGE DATA COMPACTION.** A novel, online, unsupervised feature-extraction method for high-dimensional remotely sensed image data compaction is proposed. This method is directed at the reduction of data redundancy in the scene representation of satellite-borne, high-resolution multispectral sensor data. The algorithm partitions the observation space into an exhaustive set of disjoint objects, and pixels belonging to each object are characterized by an object feature. The set of object features, rather than the pixel features, is used for data transmission and classification. Illustrative examples of high-dimensional image data compaction are presented, and the feature representation performance is investigated. Example results show an average compaction coefficient of more than 25 to 1 when this method is used; the classification performance is improved slightly by using object features rather than the original data, and the CPU time required for classification is reduced by a factor of more than 25 as well. The feature extraction CPU time is less than 15% of CPU time for original data classification. 10 refs.

**090046 SOME USEFUL OBSERVATIONS IN THE ANALYSIS OF BRIGHTNESS TEMPERATURE DATA ACQUIRED BY THE BHASKARA-II SATELLITE MICROWAVE RADIOMETER (SAMIR) SYSTEM.** The second Indian remote sensing satellite Bhaskara-II has three microwave radiometers operating at 19.35, 22.235 and 31.4 GHz. Brightness temperature ( $T_B$ ) data have been acquired by these radiometers during the period from December 1981 to July 1983 comprising 325 passes. The ground resolution of these radiometers is about 125 km circular diameter. These data have the highest potentiality for the use in sea, land- and snow-/ice-based studies. A considerable amount of work has been carried out by the Indian scientists using these data and a lot more will follow. In view of this, an attempt is made in this paper to summarize some of the useful observations regarding the reliability and nature of the data. These observations can be useful guidelines in the interpretation of  $T_B$  data. (Author abstract) 16 refs.

**090047 PRINCIPLES OF FIELD SPECTROSCOPY.** Field spectroscopy involves the study of the interrelationships between the spectral characteristics of objects and their biophysical attributes in the field environment. In this article the principles of the subjects are explained and its historical development reviewed with reference to the instruments and methods adopted. Field spectroscopy has a role to play in at least three areas of remote sensing. Firstly, it acts as a bridge between laboratory measurements of spectral reflectance and the field situation and is thus useful in the calibration of airborne and satellite sensors. Secondly, it is useful in predicting the optimum spectral bands, viewing configuration and time to perform a particular remote sensing task. Thirdly, it provides a tool for the development, refinement and testing of models relating biophysical attributes to remotely-sensed data. (Edited author abstract) 117 refs.

**090048 MICROLIGHT AIRCRAFT FOR RADIO-METRIC SURVEYING APPLIED TO LAND RESOURCES ASSESSMENT AND MONITORING IN MALI (WEST AFRICA).** A microlight aircraft has been used to obtain and record concurrent, near-continuous, spectral responses in the MSS and SPOT bands over various ground features. The experiment was performed in Mali, along the Niger River, during November, 1985. The airborne instrumentation, developed as a prototype for this experiment, also included flying-height measurements by a laser range-finder and a color video-camera. Spectral data and flying height (5 to 80 m) were scanned over 0.1 s and recorded on the audio channel of a videotape, after multiplexing and analog to digital conversion (8 channels). It is concluded that the measuring and recording system, although light and simple, proved to be very efficient for automatic survey in a tropical environment; spectral reflectance profiles are feasible in a very short time over a wide range of objects; and microlight aircraft are proving to be highly suitable as platforms for low-cost aerial survey including large-scale photography and complementary to conventional methods. (Edited author abstract). 6 Refs.

## Mathematical Models

**090050 SIMPLE MODEL TO ESTIMATE THE DAILY VALUE OF THE REGIONAL MAXIMUM EVAPOTRANSPIRATION FROM SATELLITE TEMPERATURE AND ALBEDO IMAGES.** We have tried an adaptation of the radiation model proposed by FAO, applicable in any area, for the estimation of the regional maximum evapotranspiration, ET, from temperature and albedo images obtained from a satellite. This model is based on the relationships derived. By applying this model to the Valentian Region (Spain) we have obtained an estimation of the maximum daily evapotranspiration to an accuracy of 20 percent. (Edited author abstract) 44 refs.

**090051 APPLICABILITY OF PHYSICAL OPTICS THIN PLATE SCATTERING FORMULAS FOR REMOTE SENSING.** The authors evaluate the applicability of simple formulas for scattering from flat plates that were developed using an extended physical optics (PO) procedure. These formulas take on especially simple forms (denoted here as TPO) when the plates are electrically very thin. The authors consider circular plates (disks) and show that when the radius-to-thickness ratio ( $a/t$ ) is large, the TPO formulas give accurate backscatter cross sections for all incidence angles. The PO formulas are not usable for angles of incidence near or at edge-on to the flat surfaces of the disk. On the other hand, complex polarization rate information is lost with TPO. It has been argued elsewhere that TPO should hold even for electrically small disks provided  $a/t$  is large. The authors show here that TPO gives results accurate (with some exceptions) to approximately 4% when  $a/t$  approximately 200 for Rayleigh disks. These results are obtained primarily by comparing TPO computational results with an exact numerical procedure. 12 refs.

**090052 MODELING THE GAP PROBABILITY OF A DISCONTINUOUS VEGETATION CANOPY.** A model is presented for the gap probability of a discontinuous vegetation canopy, such as forest, savanna, or shrubland. The case in which the distribution of individual canopy sizes and shapes is known and individual canopies are randomly distributed but do not overlap, and the case in which the canopies do intersect and/or overlap such that foliage density remains constant within the overlap area are both considered, although an exact solution is provided only for the latter. A comparison of modeled gap probabilities with observed gap probabilities for a Maryland (US) pine stand (as taken from the literature) shows good agreement for zenith angles of illumination up to about 45°. Above 45°, the fit worsens, presumably because the horizontal branch structure of the pine canopy is less attenuating as the illumination angle approaches the horizon. Two simple indexes that are functions of leaf area index, leaf angle distribution, and count density (number per square unit of area) and size (base radius and height) of plant canopies (assumed to be spherical or ellipsoidal) are also derived. These are used to determine which conditions are to be considered. 20 refs.

**090054 SCATTERING MODEL FOR PERFECTLY CONDUCTING RANDOM SURFACES: I. MODEL DEVELOPMENT.** The standard integral equation for the surface current is solved iteratively to obtain an estimate of the surface current on a perfectly conducting randomly rough surface. The far-zone scattered fields and the backscattering coefficients for vertical, horizontal and cross-polarizations are then computed using this current estimate. The polarized backscattering coefficients are explicit functions of the surface parameters and reduce to the Kirchhoff solution in the high-frequency region and to the first-order perturbation solution in the low-frequency region. (Edited author abstract) 29 refs.

**090055 SCATTERING MODEL FOR PERFECTLY CONDUCTING RANDOM SURFACES: II. RANGE OF VALIDITY.** By following an approach similar to that of C. Efthimiou, a condition for the validity of the approximate surface current density has been found. The condi-

tion indicates that the surface current is accurate in both the high- and the low-frequency regions and also in the intermediate-frequency region. Although the condition was derived from a particular correlation function, it should be indicative of the general case because all realistic correlation functions are monotonically decreasing and the rate of descent is controlled by the correlation parameter. 8 refs.

**090056 APPROXIMATE MODEL FOR THE MICROWAVE BRIGHTNESS TEMPERATURE OF THE SEA.** A modified two-scale model is proposed for scattering and emissivity calculations for certain classes of random rough surfaces. It is based on an approach by M.L. Burrows and by G.S. Brown, but it has been extended to bistatic scattering by lossy dielectric surfaces, and it incorporates modified Fresnel reflection coefficients and a simple correction for multiple-scattering effects. The method is shown to be applicable to the ocean surface for light and moderate winds. A contracted form of the radiative-transfer equation is proposed and the included Wentz correction for surface scattering is discussed. This could lead to a method that could be both simple and accurate enough for real-time inversion algorithms in microwave remote sensing. (Author abstract) 30 refs.

Guissard, A. (Univ Catholique de Louvain, Louvain-la-Neuve, Belg); Sobieski, P. *Int J Remote Sens* v 8 n 11 Nov 1987, Int Symp on Microwave Signatures in Remote Sensing, Goteborg, Swed, Jan 19-22 1987 p 1607-1627.

**090057 REMOTE SENSING OF WAVE PATTERNS WITH OCEANOGRAPHIC IMPLICATIONS.** First, a general review is presented of wave-current interaction processes (for horizontal shears) and their effect on radar backscatter and radar imagery (SAR/RAR). Then numerical results on the refraction of wave energy trajectories by complex bottom topography (finite depth) and a linear shear current are presented. For deep water, the wave-energy trajectories are given for mesoscale currents (e.g. eddies and double-vortex configurations). The focusing of wave energy by variable currents should have important influence on the spatial scale of wind stress over the ocean, and on optical and acoustic properties of the upper layer of the ocean. (Author abstract) 22 refs.

**090058 MODELLING OF RADAR BACKSCATTERING FROM LOW-SALINITY ICE WITH ICE RIDGES.** Radar backscattering from a snow-free ice surface characterized by an exponential correlation function is studied for conditions typical in the Baltic Sea. The C-band backscattering coefficient from first-year ice is normally found to be characterized primarily by the air-ice surface roughness. However, if the salinity and temperature are low, as in the Baltic Sea, both volume scattering and ice-water surface scattering might contribute. Even more important than scattering from the level ice is scattering from the ice ridges, and a simple approach is taken to characterize the properties of ice ridges and the corresponding scattering. (Author abstract) 12 refs.

**090059 EMISSIVITIES OF QUARTZ AND SAHARA DUST POWDERS IN THE INFRARED REGION (7-17  $\mu$ m).** Emissivities of quartz and Sahara dust

powders are computed in the infrared wavelength region (7-17  $\mu$ m) by the doubling method, together with those of a plane surface. The effect of particle size on emissivities is evaluated. A cloudy atmosphere model is used for radiative transfer in condensed powders, where a size distribution of powders is given. Particle sizes are enlarged 2, 20, and 200 times for a comparison purpose. Sahara dust powders show rather small emissivity change with particle size in comparison with that of quartz powders. These results may be used for the further development of remote sensing techniques applied to surface emissivity measurements. (Edited author abstract) 14 refs.

**090060 DIRECTIONAL REFLECTANCE FACTOR DISTRIBUTIONS FOR TWO FOREST CANOPIES.** Directional reflectance factor distributions were measured over one pine (*Pinus silvestris*) and one spruce stand (*Picea abies*), with sun elevations in the range 30-50°. Measurements were made from a helicopter at 200 m altitude, using a handheld radiometer with wavelength bands centered at 0.68, 0.85, and 1.6  $\mu$ m. Assuming bilateral symmetry, only one half of the hemisphere was measured, with 45° azimuthal and 15° zenithal increments, up to 60° off-nadir. Both stands showed a highly anisotropic reflectance especially in the red band and less pronounced differences in the 0.85  $\mu$ m band. It was found that at 27° off-nadir in a WNW direction the reflectance increased by a factor of up to 1.6, as compared to nadir measurement. (Edited author abstract) 12 refs.

**Millimeter Waves**

**090061 MILLIMETERWAVE NETWORK ANALYZER BASED SCATTEROMETER.** The Millimeterwave Polarimeter (MMP) is a network-analyzer-based scatterometer and reflectometer system that has been developed in support of a program to characterize radar clutter at 35, 94, and 140 GHz. A Hewlett-Packard 8510A network analyzer is used in the MMP system as a signal conditioner and processor to facilitate real-time data reduction, to reduce the short time-delay leakage noise inherent in traditional FM/CW radar, and to further enhance the signal-to-noise ratio of the system through signal processing techniques. Operation of the system at millimeter wavelengths is achieved with upconversion and harmonic downconversion. The use of harmonic downconverters permits low-frequency signal connections between components of the system and allows easy reconfiguration in either scatterometer, bistatic, or reflection/transmission modes. 3 refs.

**090062 USING LANDSAT MULTISPECTRAL SCANNER DATA TO ESTIMATE SUSPENDED SEDIMENTS IN MOON LAKE, MISSISSIPPI.** Suspended sediments are a major factor affecting water quality in many aquatic ecosystems. Research was undertaken to determine the application of digital spectral data collected by the multispectral scanner (MSS) on the Landsat satellite for estimating suspended sediments in aquatic ecosystems where mean annual concentrations of

suspended sediments are greater than 50 mgL<sup>-1</sup>. This study showed that digital spectral data from the Landsat satellites can be used to locate and monitor surface-suspended sediments in aquatic ecosystems. With such a digital computer technique, entire regions can be surveyed quickly to locate aquatic ecosystems with suspended sediment problems. (Edited author abstract) 46 refs.

Ritchie, Jerry C. (USDA, Beltsville, MD, USA); Cooper, Charles M.; Jiang, Yongqing. *Remote Sens Environ* v 23 n 1 Oct 1987 p 65-81.

**090063 COMPARISON OF LANDSAT MSS PIXEL ARRAY SIZES FOR ESTIMATING WATER QUALITY.** A problem in the analyses of Landsat Multispectral Scanner (MSS) data is sampling pixels representative of the area being used for calibration. This study reports the analyses of different size pixel arrays for estimating water quality variables. Nested arrays of pixels with sizes of 5 by 5, 3 by 3, and 2 by 2, and the single center pixel of the 5 by 5 array were sampled at five different locations in the lake where water quality variables had been measured. Fourteen Landsat scenes for the period between January 1983 and June 1985 were analyzed. Analysis of variance (ANOVA) found no significant differences in mean pixel values due to the size of the pixel arrays. (Edited author abstract) 20 refs.

**090064 AIRCRAFT MSS DATA REGISTRATION AND VEGETATION CLASSIFICATION FOR WETLAND CHANGE DETECTION.** Portions of the Savannah River floodplain swamp were evaluated for vegetation change using high resolution aircraft multispectral scanner (MSS) data. Image distortion from aircraft movement prevented precise image-to-image registration in some areas. However, when small scenes were used, a first-order linear transformation provided registration accuracies of less than or equal to one pixel. A larger area was registered using a piecewise linear method. Five major wetland classes were identified and evaluated for change. Phenological differences and the variable distribution of vegetation limited wetland type discrimination. Using unsupervised methods and ground-collected vegetation data, overall classification accuracies ranged from 84 per cent to 87 per cent for each scene. Results suggest that high-resolution aircraft MSS data can be precisely registered, if small areas are used, and that wetland vegetation change can be accurately detected and monitored. **090065 FORECASTING PATTERNS OF SOIL EROSION IN ARID LANDS FROM LANDSAT MSS DATA.** The model is based on the erosion cell mosaic approach and exploits the high degree of temporal and spatial autocorrelation in the erosion process on flat alluvial plains. The model used for forecasting change is a first-order simultaneous autoregressive (s.a. r.) process which can reproduce changes in mean, variance and spatial autocorrelation. This model expresses each pixel value as a function of those of its neighbors plus a noise term. The forecasting procedure involves fitting a s.a. model to an area, obtaining the values of the underlying pattern (noise) series by inverse filtering and then obtaining a forecast by filtering the underlying pattern series using a prototype s.a. model for a more (or less) degraded state. (Edited author abstract) 16 refs.

**090066 AUSTRALIAN LANDSAT STATION AT X-BAND.** The ALS/CSIRO Signal Processing Experiment was devised to gain experience in the acquisition and processing of high-quality-image data from the thematic

mapper on the Landsat V satellite. These data are relayed to earth on an 8212.5 MHz radio link at a rate of 85 Mb s<sup>-1</sup>. The ALS 9.14-m-diameter antenna at Alice Springs is currently being modified by CSIRO to allow collection of these data on an experimental basis. The changes necessary and the expected system performance of the modified antenna are outlined. The aim was to obtain design and fabrication experience with a minimum of cost and with no impact on the normal MSS operations of ALS. Design was based on a two-year lifetime and is far from an operational system. (Author abstract) 20 refs.

**090067 INTERANNUAL LANDSAT-MSS REFLECTANCE VARIATION IN AN URBANIZED TEMPERATE ZONE.** The focus of this work is to assess the possibility of using Landsat satellite data for the quantitative parametrization of land-surface properties and to track the temporal variability of these same parameters over the past 10 years. The results show that, for the Montreal study area, the yearly mean albedo underwent a significant decreasing trend (-0.05) since 1972 due to processes of urbanization, deforestation, and decreasing farmland. The effects of these respective land-surface alterations are discussed. For the whole data base, the year-to-year NVI fluctuations correlate with the cumulative amount of summer precipitation which in turn is related to the mean summer evapotranspiration and global solar radiation. **090068 IMPROVED DARK-OBJECT SUBTRACTION TECHNIQUE FOR ATMOSPHERIC SCATTERING CORRECTION OF MULTISPECTRAL DATA.** An improved dark-object subtraction technique is demonstrated that allows the user to select a relative atmospheric scattering model to predict the haze values for all the spectral bands from a selected starting band haze value. The improved method normalizes the predicted haze values for the different gain and offset parameters used by the imaging system. Examples of haze value differences between the old and improved methods for Thematic Mapper Bands 1, 2, 3, 4, 5, and 7 are 40.0, 13.0, 12.0, 8.0, 5.0, and 2.0 vs. 40.0, 13.2, 8.9, 4.9, 16.7, and 3.3, respectively, using a relative scattering model of a clear atmosphere. In one Landsat multispectral scanner image the haze value differences for Bands 4, 5, 6, and 7 were 30.0, 50.0, 50.0, and 40.0 for the old method vs. 30.0, 34.4, 43.6, and 6.4 for the new method using a relative scattering model of a hazy atmosphere. (Edited author abstract) 20 refs.

**090069 SPECTRAL-TEMPORAL INDICES FOR DISCRIMINATION.** Multi-temporal data from a spacecraft typically involve a number of spectral bands recorded at a number of overpasses or times. Canonical variates for discrimination between a number of groups are derived when the same discriminant coefficients for bands (i.e. spectral indices) are assumed to hold for all times. The calculations reduce to simultaneous between-groups to within-groups analyses of a linear combination of bands and a linear combination of times. The approach is discussed in the context of a study of crop discrimination using Landsat MSS data. (Author abstract) 7 refs.

**090070 DIRECTED BAND RATIOING FOR THE RETENTION OF PERCEPTUALLY-INDEPENDENT TOPOGRAPHIC EXPRESSION IN CHROMATICITY-ENHANCED IMAGERY.** Enhancements

of multispectral imagery, intended for visual interpretation of geological information, are typically designed to increase the discriminability of band-variant surface reflectance features. Band ratioing has been commonly used for this purpose with various degrees of success. A disadvantage of band ratioing has been the loss of topographic expression and surface albedo information or, in some cases, the perceptual convolution of both topographic expression and albedo information with band-variant reflectance information. **090071 NON-PARAMETRIC TEST OF OVERLAP IN MULTISPECTRAL CLASSIFICATION.** Difficulties are encountered when a pixel may be assigned to more than one class according to the information gleaned from training sets. The following question arises: Is there real overlap or are the training sets spectrally discrete? A general algorithm is presented which quantifies the degree of overlap of classes defined by training sets drawn from an image. Test results show that age classes within a forest plantation are spectrally discrete, even though poor classification accuracies were obtained using conventional classifiers. **090074 LOW-LEVEL SEGMENTATION OF MULTISPECTRAL IMAGES VIA AGGLOMERATIVE CLUSTERING OF UNIFORM NEIGHBOURHOODS.** A segmentation approach based on the concept of unsupervised classification of pixels is presented. Mean feature vectors of the classes are obtained from agglomerative-type clustering of the feature values computed over uniform neighbourhoods. Two assumptions are made in this development. The first is that at least one uniform neighbourhood can be found for each of the different categories present in the image. The second is that feature vectors of neighbourhoods representative of a particular category are similar to each other, but different from those of neighbourhoods belonging to other categories. The scheme has been applied to the segmentation of a

three-band multispectral image of a terrain with satisfactory results. The method is computationally efficient, and requires minimal memory; hence it can be used in real time. (Author abstract). 14 Refs.

**090076 BATHYMETRY STUDIES ON THE COASTAL WATERS (RED SEA) OF JEDDAH, SAUDI ARABIA, USING SHUTTLE MOMS-01 DATA.** MOMS (Modular, Optoelectronic Multispectral Scanner) data recorded from the Space Shuttle flight STS-7 have been used to investigate water depths in the Red Sea in the vicinity of Jeddah, Saudi Arabia. An exponential relationship between pixel intensity (digital number) and water depth was observed. However, the r.m.s. deviation of the fit of the data to control points from the hydrographic charts for the area was about 3.7 m which is much too large for operational bathymetric work. The reason for this is the low sensitivity of the instrument and the non-suitability of the spectral bands. (Edited author abstract). 4 Refs.

**090077 DETECTION OF FOREST CHANGE IN THE GREEN MOUNTAINS OF VERMONT USING MULTISPECTRAL SCANNER DATA.** This study evaluates the potential of Landsat Multispectral Scanner (MSS) data to monitor long term changes in high-elevation coniferous forests. August 1973 and 1984 MSS data from the Green Mountains of Vermont were used. Following co-registration and standardization of data sets, color density slices of 0.75 µm and 0.95 µm band difference images were produced. False color composites using either (a) the 1973 0.65 µm and 0.75 µm band in conjunction with the 0.75 µm band difference data set or (b) the 1973 0.65 µm and 0.95 µm band in conjunction with the 0.95 µm band difference data set, were also produced. It is believed that the reflectance decreases noted for the high-elevation coniferous forests are related to the forest decline process and are associated with reduction in green leaf biomass and/or the increased levels of mortality and higher amounts of dead branches accompanying this reduction in biomass. (Edited author abstract). 25 Refs.

**090078 SELECTING A SPATIAL RESOLUTION FOR ESTIMATION OF PER-FIELD GREEN LEAF AREA INDEX.** For any application of multispectral scanner (MSS) data, a user is faced with a number of choices concerning the characteristics of the data; one of these is their spatial resolution. A pilot study was undertaken to determine the spatial resolution that would be optimal for the per-field estimation of green leaf area index (GLAI) in grassland. By reference to empirically-derived data from three areas of grassland, the suitable spatial resolution was hypothesized to lie in the lower portion of a 2-18 m range. To estimate per-field GLAI, airborne MSS data were collected at spatial resolutions of 2 m, 5 m and 10 m. The highest accuracies of per-field

GLAI estimation were achieved using MSS data with spatial resolutions of 2 m and 5 m. (Author abstract). 16 Refs.

**090079 HIGH RESOLUTION OF COLOR COMPOSITE IMAGE FROM SPOT AND LANDSAT DATA.** The Landsat/TM (thematic mapper) has 7 bands. It can make 7 images with 7 TM bands and do multispectral imaging. The resolution of the Landsat/TM is 30 m. The resolution of the Spot/HRV (High Resolution Visible Imaging System)/P mode is 10 m and that image is very clear. But the Spot/HRV P mode has only 1 band and it cannot make color images. The authors succeeded in creating new multispectral color images with a resolution of 10 m from Landsat/TM and Spot/HRV. The requirements for the color image composition are (1) spectral patterns of images of Landsat and Spot are the same, or (2) the two spectral patterns are not the same but the distribution of the space patterns is the same. (Edited author abstract). 2 Refs. In Japanese.

**090081 EFFECTIVE RESOLUTION ELEMENT OF LANDSAT THEMATIC MAPPER.** As part of the U.K.'s contribution to NASA's Landsat Image Data Quality Analysis (LIDQA) program the system performance of the Thematic Mapper (TM) scanner has been studied by the determination of the Effective Resolution element (ERE), a measure of its spatial resolution. In this paper, an estimate of the ERE has been determined from a simulation of the spatial responses of the Primary Focal Plane (PFP) detectors, bands 1-4, of both Landsat-4 and Landsat-5 and from image-derived values using a band 4 Landsat-5 TM scene of the U.K. A value derived by spatial response simulation of the Landsat-4 MSS near-infrared (NIR) detectors, band 4, was also determined for comparative purposes, but as yet no values have been produced for either TM scanner to cover the detectors on the Cold Focal Plane (CFP), bands 5-7. **090082 EFFECT DE LE RESOLUTION SPATIALE SUR DES PROPRIETES STATISTIQUES DES IMAGES SATELLITES: UNE ETUDE DE CAS.** [Effect of Spatial Resolution on the Statistical Properties of Satellite Images: A Case Study.]. The AVHRR instrument on board the NOAA satellites has a very high repetitivity but a very low spatial resolution. In our research we proposed to monitor the normalized vegetation index with this low-resolution instrument. It is therefore of interest to examine the relations between high- and low-resolution images for using the AVHRR data as a means of interpolation between two MSS images. This problem is addressed here using satellite images of an important agricultural region in France. The effect on the higher-order statistical properties is studied through the transformation of the images' textures by progressively degrading the MSS images. It is shown that a threshold, which depends on the scene, exists on the resolution below which all statistical information disappears. (Edited au-

thor abstract). 10 Refs. In French.

**090083 SEGMENTATION OF REMOTELY-SENSED IMAGES BY A SPLIT-AND-MERGE PROCESS.** A system for the segmentation and region-based classification of remotely-sensed imagery has been developed and tested. The segmentation process involves a split-and-merge algorithm and a quadtree data structure. Both the segmenter and the classifier utilize texture information. Experimental classification results show that the method can lead to an improvement in average performance (AP), and a corresponding reduction in average confusion (AC). The segmentation requires substantial computation and the setting of the segmentation parameters is also fairly tedious (though some means of automating this should be possible). However, for many applications the increase in classification accuracy achievable may make these limitations acceptable. 16 Refs.

**090084 MODEL-BASED REMOTELY-SENSED IMAGERY INTERPRETATION.** We present a model-based remotely-sensed image interpretation expert system embedded in a knowledge-based geographic information system (KBIS). The KBIS consists of four sub-systems: a pictorial data base system, an image interpretation expert system, a computer-aided planning system, and a computer-aided cartographic system. The image interpretation expert system represents ecological knowledge and other expert knowledge by frames. Its reasoning process consists of a forward reasoning based on the Bayes classification of Landsat imagery, a backward reasoning using frame knowledge and reasoning using a spatial consistency model. A forest inventory study was conducted in Shaxian county, in the southern part of China, using this expert system. The results have shown a significant improvement. Building image interpretation expert systems within knowledge-based pictorial systems is very convenient and efficient because there are well-organized data, knowledge and procedures available. **090085 ALGORITHM FOR AUTOMATIC ATMOSPHERIC CORRECTIONS TO VISIBLE AND NEAR-IR SATELLITE IMAGERY.** An algorithm is developed for automatic atmospheric correction of satellite imagery of the Earth's surface. The algorithm is based solely on the satellite image being corrected and on climatology of the area. It is applicable to low resolution (1 km field of view) and high resolution (10-80 m field of view) imagery of land areas for the solar spectrum. The algorithm requires that some pixels in the image will correspond to dense dark vegetation as the surface cover. Once the presence of such pixels is established, the algorithm automatically chooses these pixels, derives the atmospheric optical thickness (a measure of the amount of haze) and corrects the image. The correction algorithm was applied to clear and hazy Landsat Multispectral Scanner images of the same area in the Washington D.C. and the Chesapeake Bay region. The algorithm, in its present form, can be applied to satellite imagery that includes at least two channels in the visible part of the spectrum, preferably blue and red. **090086 DETECTION OF CIRCULAR GEOLOGICAL FEATURES USING THE HOUGH TRANSFORM.** The Hough transform is a technique commonly used in the field of computer vision for detecting lines and shapes in digital imagery. The application of this method

to the detection of circular geological structures in Landsat Multispectral Scanner imagery is described. The method was successful in identifying most of these features apparent to the human analyst, in addition to a number of errors of commission. It is proposed that the error rate is tolerable for this particular application. (Author abstract). 6 Refs.

**090087 SOME RESULTS OF A MOS - 1 AIRBORNE VERIFICATION EXPERIMENT - MULTISPECTRAL ELECTRONIC SELF - SCANNING RADIOMETER (MESSR).** The Marine Observation Satellite-1 (MOS-1) was launched on February 19, 1987. In order to develop the distortion correction methods for MOS-1 data and the evaluation methods for the MOS-1 earth observation system, the National Space Development Agency of Japan (NASDA) conducted a MOS-1 airborne verification experiment in Kanto and Hokkaido, Japan in 1984 and 1985 by using three airborne sensors equivalent in performance to MOS-1 sensors in collaboration with many related agencies. The airborne MESSR is a multispectral electronic self-scanning radiometer developed by modifying an engineering model of the MOS-1 MESSR, which is capable of observing in visible and near-infrared wavelengths with CCD detector elements. Some results from the airborne MESSR are presented. 5 refs.

**090088 TRANSFORMATION FOR ORDERING MULTISPECTRAL DATA IN TERMS OF IMAGE QUALITY WITH IMPLICATIONS FOR NOISE REMOVAL.** A transformation known as the maximum noise fraction (MNF) transformation, which always produces new components ordered by image quality, is presented. It can be shown that this transformation is equivalent to principal components transformations when the noise variance is the same in all bands and that it reduces to a multiple linear regression when noise is in one band only. Noise can be effectively removed from multispectral data by transforming to the MNF space, smoothing or rejecting the most noisy components, and then retransforming to the original space. In this way, more intense smoothing can be applied to the MNF components with high noise and low signal content than could be applied to each band of the original data. The MNF transformation requires knowledge of both the signal and noise covariance matrices. Except when the noise is in one band only, the noise covariance matrix needs to be estimated. One procedure for doing this is discussed and examples of cleaned images are presented. 6 refs.

**090089 ATMOSPHERIC EFFECT ON SPECTRAL SIGNATURE - MEASUREMENTS AND CORRECTIONS.** Measurements of the atmospheric effect on the spectral signature of surface cover were conducted during hazy conditions over the Chesapeake Bay and its eastern shore. In the experiment the upward radiance was measured by an airborne scanning radiometer in nine spectral bands between 465 and 773 nm, above and below the haze layer. Simultaneous measurements of the aerosol optical thickness and its vertical distribution were conducted. The results of the measurements are used to study the spectral dependence of the atmospheric effect on remote sensing of water bodies and vegetated fields (forest, corn field, and pasture), and to verify theoretical predictions. It is suggested that the radiances over dark areas (e.g., water in the near IR and forest in the visible) can be used to derive the aerosol optical thickness as is

done over oceans with the CZCS satellite images. Combined with climatological information, the derived optical thickness can be used to perform corrections of the atmospheric effect. Examples of the derivation of the aerosol optical thickness and correction of the upward radiances are given. 28 refs.

## Noise, Spurious Signal

**090090 NOISE REMOVAL FOR SPOT HRV IMAGERY.** SPOT HRV imagery acquired in 'double' mode displays near vertical striping occurring every seven or eight pixels in the down-track scan direction. Six digital image restoration procedures have been examined for suppressing or removing this noise. Image restoration by filtering in the spatial frequency domain was found to be the most effective procedure. However, although less effective at noise removal, a simple median filtering procedure could be used with greatly reduced computational cost. (Author abstract) 9 refs.

## Norway

**090091 FJORD TEST - NAVSTAR GPS.** Parts of Norway have very narrow fjords and sounds with high, steep sides. In such places the NAVSTAR-GPS signals periodically will enter the mountain shadow in relation to vessels in the fjord. When the signal is thus occluded there is a theoretical possibility that the GPS receiver may pick up a reflection of the signal from the opposite mountain wall and use it in its navigational calculations. This presents a hazard, especially at times of poor visibility. It is therefore important to determine whether this problem is merely a theoretical possibility or whether it must be taken into account when navigating by GPS. This article presents a test to investigate this problem. (Author abstract) In Norwegian.

## Research

**090092 NUMERICAL DERIVATION OF A HYDRODYNAMIC SURFACE FLOW FIELD FROM TIME SEQUENTIAL REMOTELY SENSED DATA.** This paper reports research findings involving the development and initial testing of a unique methodology which combines numerical fluid dynamics modeling and remote sensing techniques to derive surface flow information for a hydrodynamic region. The methodology is unique in that it involves an inverse model of hydrodynamic tracer conservation which utilizes tracer information derived from remote sensing and subsequent image processing to generate a surface flow field. The flow field is generated in a Eulerian framework—that is, the flow is described at fixed points in space over the entire field. A numerical model based on a two-dimensional tracer conservation equation is developed and tested with simulation maps of time varying tracer distributions. The model derives a solution of the stream function (i.e., flow) field by solving a finite difference version of a partial differential conservation equation. (Edited author abstract) 28 refs.

**090094 SEMIVARIOGRAM IN REMOTE SENSING: AN INTRODUCTION.** The Earth's surface and remotely sensed imagery contain spatial information that, if quantified, could be used to optimize many sampling procedures in remote sensing. Until recently a suitable and simple technique for the spatial characterization of surfaces was not readily available. Due to the development of regionalized variable theory there is a near-ideal tool, the semivariogram. The semivariogram is a function that relates semivariance to sampling lag. This function can be estimated using remotely sensed data or ground data and represented as a plot that gives a picture of the spatial dependence of each point on its neighbor. This paper provides an introduction to the semivariogram and indicates how it could be employed in remote sensing research. (Edited author abstract) Refs.

## Scandinavia

**090095 SCANDINAVIAN ACTIVITIES IN THE LIS/GIS AREA.** Before a Land or Geographic Information System (LIS/GIS) can be fully utilized for planning and decision making, an integrated database must be developed. The Scandinavian countries are currently building geocoded record keeping systems concerning population, property, topography, and tax records. As these national computerized databases near completion, their immediate and potential usefulness is quickly becoming apparent at all levels of government and industry. Sizable investment, however, are required in order to implement and operate a large LIS/GIS. In addition, datasets are often duplicated for use in different systems or are simply incompatible. Major cost reduction benefits, therefore, can only be realized by standardizing database content and format and by encouraging cooperation and exchange of data between the agencies concerned with their maintenance and use. (Author abstract) 9 refs.

## Sensors

**090096 SIR-B EXPERIMENTS IN JAPAN. II. SURFACE ACTIVITY. 1. SENSOR CALIBRATION EXPERIMENT. a. DISUSED AKITA AIRPORT TEST SITE.** A sensor calibration experiment was proposed as part of SIR-B experiments in Japan, together with the rice crop experiment and the ocean oil-pollution detection experiment. This sensor calibration experiment was intended (1) to establish a transfer function from image data to radar backscattering characteristics, (2) to evaluate 3-dB resolutions, (3) to verify the ability to resolve two closely-spaced targets, and (4) to clarify sidelobe structures due to range and azimuth compressions. The disused Akita Airport was chosen as the main test site for the calibration experiment on the first three objectives. This paper describes the test site, the design of the corner reflectors, and briefly predicts the results. (Author abstract) 10 refs.

**090098 SIR-B EXPERIMENTS IN JAPAN. II. SURFACE ACTIVITY. 1. SENSOR CALIBRATION EXPERIMENT. c. YAMAGAWA TEST SITE.** In the SIR-B calibration experiment to establish the SIR-B transfer function, to evaluate the 3-dB resolutions, and to check the SIR-B ability to resolve two closely-spaced targets, two test sites were chosen in addition to the main test site at the disused Akita Airport. The other two sites were chosen to evaluate the influence of background clutter on the apparent imaging characteristics of SIR-B. These two test sites were Sarobetsu wild land in Hokkaido, and Yamagawa Port and Yamagawa Radiowave Observatory, Radio Research Laboratory in Kagoshima. This paper describes the ground activity at the Yamagawa test site. Conditions at the test site are described as well as the arrangement and setting of square trihedral corner reflectors. Anticipated results for the SIR-B imaging are also discussed. (Author abstract) 4 refs.

**090099 SIR-B EXPERIMENTS IN JAPAN. II. SURFACE ACTIVITY. 1. SENSOR CALIBRATION EXPERIMENT. d. KASHIMA TEST SITE.** The SIR-B calibration experiment had two major objectives: to clarify the imaging characteristics of SIR-B, and to evaluate the sidelobe structure of SIR-B. This paper describes the ground activity for the evaluation of the sidelobe structure. Large diameter antennas in Kashima Space Research Center, Radio Research Laboratory, were chosen as targets with very large radar cross sections, so that the SIR-B sidelobe responses due to the targets stand out over the background clutter. The radar cross section of the antennas was intended to be controlled by placing a metal plate or a wave absorber on the primary feed horns. Three 1.1-m corner reflectors were deployed as standard radar targets in reclaimed land near Kashima Space Research Center. (Edited author abstract)

**090100 SIR-B EXPERIMENTS IN JAPAN. IV. EXPERIMENTAL RESULT. 1. SENSOR CALIBRATION EXPERIMENT.** Among the test sites for the SIR-B calibration experiment, the Sarobetsu test site was successfully imaged twice on ascending and descending orbits. The SIR-B image data taken over the test site are analyzed to calibrate the image and to estimate the 3-dB resolution. Square trihedral corner reflectors with different radar cross sections (RCS) are used to relate the image data number to RCS. The RCS of the background surface is estimated and its effect is also included in these relations. The 3-dB resolutions are estimated by two independent techniques. The results of these two techniques agree with each other; however, the estimated

resolutions are larger than those predicted by the Jet Propulsion Laboratory. (Edited author abstract) 11 refs.

## South America

**090101 CHARACTERIZATION AND CLASSIFICATION OF SOUTH AMERICAN LAND COVER TYPES USING SATELLITE DATA.** Various methods are compared for carrying out land cover classifications of South America using multitemporal Advanced Very High Resolution Radiometer data. Fifty-two images of the normalized difference vegetation index (NDVI) from a 1-year period are used to generate multitemporal data sets. Three main approaches to land cover classification are considered, namely the use of the principal components' transformed images, the use of a characteristic curves procedure based on NDVI values plotted against time, and finally application of the maximum likelihood rule to multitemporal data sets. Comparison of results from training sites indicates that the last approach yields the most accurate results. (Edited author abstract) 30 refs.

## Sudan

**090102 COMPARATIVE ANALYSIS OF DYKE LINEAMENTS MAPPED FROM SHUTTLE IMAGING RADAR AND LARGE FORMAT CAMERA PHOTOGRAPHY IN HYPERARID AREAS OF THE EASTERN DESERT, EGYPT, AND RED SEA HILLS, SUDAN.** The Red Sea Hills (Sudan) and Eastern Desert (Egypt) have been selected, as areas with hyperarid climate, for a comparative study of SIR-B radar imagery and Large Format Camera (LFC) spaceborne photography. Some areas with extensive sand sheets in which dikes and dike swarms were partially outcropping were studied in detail and a dike lineament analysis was made using the different remote sensing data sets. Particularly from the LFC photos much detail could be obtained through stereo analysis. It appeared that the radar images revealed some information on the dike rocks covered by a shallow sand layer, otherwise invisible on Landsat and LFC images. (Edited author abstract) 8 refs.

## Technology Transfer

**090103 MANAGING REMOTE SENSING TECHNOLOGY TRANSFER TO DEVELOPING COUNTRIES: A SURVEY OF EXPERTS IN THE FIELD.** The transfer of Landsat-related remote sensing technology from the United States to developing countries was examined in this research. A survey of experts in the field of remote sensing technology was conducted to determine what they perceived as the major obstacles to remote sensing technology transfer (RSTT). Usable questionnaire responses were received from 666 professionals in 66 countries. Responses of participants representing developed countries, developing countries, and international organizations were compared in order to identify similarities and differences in their perceptions of the RSTT obstacles. In addition to examination of individual questionnaire items, the data were analyzed further to reveal underlying issues that must be recognized and addressed if remote sensing technology is to be successfully applied to development activities. (Author abstract) 5 Refs.

## Temperature Measurement

**090104 IMPACT OF SPECTRAL EMISSIVITY ON THE MEASUREMENT OF LAND SURFACE TEMPERATURE FROM A SATELLITE.** The split-window method for measuring surface temperature is applied to land surface. In order to relate land surface temperature to the two brightness temperatures measured from space in the two channels of interest (namely, AVHRR 4 and AVHRR 5), several formulae are derived and their accuracies are discussed. It is shown that in order to infer land surface temperature from space, it is therefore necessary to know the surface spectral emissivity to good accuracy. Possible methods to determine it are then proposed and discussed. (Edited author abstract) 24 refs.

**090105 ESTABLISHING AND USING A VLSI LABORATORY.** Establishing a CAD laboratory is one of the first steps in promoting high tech design through the student body. This kind of program will help as a tool in the educational instruction as well as promote much closer working relationships with the appropriate industry. This paper describes in detail the approach used by Temple University in establishing and utilizing VLSI workstations for more automated integrated circuits design. The workstations are utilized for undergraduates as well as graduate interactions. However, a number of the undergraduate and graduate students would be involved in the practical research and development of the VLSI designs. (Edited author abstract) 4 Refs.

## Climate Control

**090107 THERMAL STORAGE WITH EMS CONTROL.** An in-house application of ice thermal storage controlled by a centralized energy management system is described in detail. The combined system is installed and operating in the newly remodeled Trane Technology Center in La Crosse, Wisconsin, near the east bank of the Mississippi River. This northern location has an average of 7,540 heating degree days and 683 cooling degree days. For this region, the design dry-bulb cooling temperature is 91 F and wet-bulb is 75 F. An energy management system (EMS) equipped with equation processing is used to control and monitor the thermal storage system components. Equation processing is a user definable control program within the software of the EMS. The routines are written in a language similar to elementary Fortran statements.

**090109 PLANNING FOR LABORATORY COMPUTING AND COMMUNICATIONS.** Alcoa Laboratories replaced earlier ad hoc efforts with an ongoing computing resource planning activity operating on an annual cycle based on the schedule for capital and operating budgets. The activity has the following characteristics: management support; integration with and support of the laboratory budgeting process; broad participation of all laboratory divisions/departments; leadership from outside the central Computing Section; involvement of computing specialists and generalists; short-term plans flow from long-range goals; plans based on needs of laboratory people. The success of this approach to planning for laboratory communication and computing resources has been established. 15 Refs.

## Concrete

**090110 SANDWICH-TYPE CONSTRUCTION PROJECT IS CAST-IN-PLACE.** This paper describes the design and construction of new facilities for a major pharmaceutical company in New Jersey. The cast-in-place structural concrete project consists of a chemical research building, a medical development building, and a scientific information center that includes a library and small auditorium. It was decided to use a prestressed concrete structural system with sandwich-type roofs and walls. This type of concrete building has a relatively large thermal mass, which is required for heat balance. To further reduce heat loss, double-glazed lightly tinted open windows were used for all buildings. To reduce noise propagation from floor to floor, neoprene interfaces were introduced at the joints between columns, walls, and beams. (Edited author abstract)

**090112 GM's HEALTHY PAIN.** This paper discusses the job functions of those involved in research and development with particular emphasis on the role played by a laboratory in a company's business objectives. General Motors recently arrived at a method by which to estimate the minimum profitability of the research laboratories. The method involves agreeing with the operating division on a value to be placed on the dozen or so most profitable items developed by the research division. The method depends on the fact that every year, a few extremely valuable items are developed and put to use. These items more than pay for the research part of the organization.

**Modernization**

**090115 CAD IN AN UNCOMMON ROLE.** A London based multi disciplinary practice is claiming that its development of the use of CAD systems for design co-ordination, presentation and tightening up the design process, has provided a basis for the successful extension of these techniques into the forbidden territory of refurbishment. In May last year the YRM Partnership was

presented with a design brief to update the Courtauld Institute of Biochemistry for the Ludwig Institute of Cancer Research and University College London. The £3.5 million scheme centres on the upgrading of an existing 1920s building to incorporate modern laboratory and office facilities and was to be carried out on a relatively small budget and on a tight schedule. Some 15 months later the laboratory is ready for occupation, completed on time and within budget and the YRM Partnership and its newly established structures division is toasting its first refurbishment project carried out using a CAD System.

**090116 MEASURING AND IMPROVING LABORATORY PRODUCTIVITY/PRODUCTION.** The article examines a typical quality program for a 3M manufacturing unit. The conclusion was that manufacturing's quality program is based on: meeting product specifications; meeting customer requirements; doing-it-right the first time; and just-in-time processing. The expected productivity results are: less inventory, less labor, less capital, and less process time. The article also examines inventory in a laboratory and just-in-time processing.

Krogh, Lester C. (3M Co). *Res Manage* v 30 n 6 Nov-Dec 1987 p 22-24.

**090117 ENVIRONMENTAL INFLUENCES ON MANAGING RESEARCH ORGANISATIONS.** Research productivity might well be defined in terms of a wider range of indicators than numbers of papers published or patents awarded. Industrial policy in America is quite fragmented in comparison with that in Europe or Japan, and the uncertainty this creates may contribute to malfunctions in research endeavors. Politicization seems to be intensifying in all of America's larger organizations, but the injection of political intrigue into research organizations can have consequences more disastrous than might be expected.

**Quality Control** See Also MANAGEMENT—Research and Development Application; PRODUCT DESIGN; PRODUCT DESIGN—Planning; PRODUCT DESIGN—Reliability.

**090118 MEETING THE NEW QUALITY CHALLENGE.** The new quality challenge is to transform the research and development organization into a Total Quality Company culture. This starts with an educational process, of every person on the staff, in the philosophy, principles and tools of the modern quality management process. Everyone throughout the organization must be involved. This transformation will not be quick or easy, and will require well-thought-out plans and strategies. And most important of all, success in this quality transformation demands high prioritization and active management leadership.

Murray, Thomas J. (Eastman Kodak Co). *Res Manage* v 30 n 6 Nov-Dec 1987 p 25-30.

**090119 BETTER THAN TAGUCHI ORTHOGONAL TABLES.** There has been a great amount of publicity about Taguchi orthogonal tables. This paper will evaluate the pros and cons of that approach. In addition an American approach, having the same initial goals of the Taguchi approach, will be presented in detail, representing a significant improvement in meeting those goals without confounding interactions with any main effect or with other interactions. In addition, this constructive alternative generally requires a much smaller number of tests. (Author abstract) 6 refs.

**Safety Codes**

**090120 MATRIX MANAGEMENT: A WORKABLE APPROACH TO SAFETY.** The Lawrence Livermore National Laboratory conducts a variety of research programs that have state-of-the-art safety problems to control. The personal growth and development of safety professionals at the Laboratory in solving program safety issues has led to national leadership by LLNL in a number of technical safety areas. A matrix management approach to safety ensures effective, timely support for research projects. It provides a 'systems' look at complex research projects and reduces the potential for errors and omissions through joint and multiple safety reviews. This approach is now being adapted to varying degrees at other facilities requiring high ratios of safety support. A similar structure may well be suitable for companies that, like LLNL, have multiple facilities - a safety team located at each facility tied to a corporate department. 4 refs.

**090121 RESERVOIR BOTTOM CONDITIONS AND HYDRODYNAMIC PRESSURES ON STRUCTURES.** In this paper, boundary conditions of a general, absorptive reservoir bottom are derived, and a method for analyzing hydrodynamic pressures on rigid structures with the general conditions is presented. In the studies, the reservoir bottom is idealized as laminated elastic media; and the water, as a compressible but non-viscous liquid. The point collocation method is used to investigate water pressures on dams due to horizontal harmonic ground motion. Based on the results from typical examples, some important characteristics of water pressures and water loads on rigid dams with general absorptive reservoir bottoms are illustrated. (Edited author abstract) In Chinese. 5 refs.

**090122 50 m<sup>3</sup> FERROCEMENT WATER RESERVOIR IN CANAR, ECUADOR.** The 50 m<sup>3</sup> domed ferrocement tank for water storage, the first in Ecuador, was constructed in San Rafael, Canar Province. The detailed construction procedure is described and each construction step is illustrated with photographs. Considerable savings in material cost (66%) and construction time (about 50%) were realized by employing ferrocement instead of reinforced concrete. Based on the procedure outlined here, 25 ferrocement reservoirs of various capacities have been built in Ecuador. (Author abstract) 2 refs.

McPeak, M. (TECOGEN Inc, Waltham, MA, USA). *J Ferrocem* v 17 n 3 Jul 1987 p 223-229.

**090123 PUMPING STATIONS AT PLOVER COVE RESERVOIR AND TOLO CHANNEL AQUEDUCT, HONG KONG.** The rapidly increasing demand for water in Hong Kong has been met by importing substantially

more raw water from China. These recent increases have required major additional works at Plover Cove reservoir including two large pumping stations. Operational requirements that the reservoir remain in use throughout construction and the location of the works in a scenic area have imposed special design considerations. The new stations have deeper draw-offs than the existing pumping station and economic studies resulted in totally different solutions for each station. Tai Mei Tuk B is a wet-well station of 1390 million liters per day (ML/day) capacity sited in the reservoir and connected to the shore by a 300 m long bridge, all supported on deep piled foundations. The pumps will deliver water through siphon pipes laid over the bridge. A major factor in the design and contract documentation was the need to leave scope for ingenuity to overcome the unusual construction conditions. The Paper describes the development of the designs for permanent works and indicates how provision was made for flexibility of construction method. (Edited author abstract) 4 refs.

McMeekan, J.F. (Binnie & Partners, Hong Kong); Yue, K.P. *Proc Inst Civ Eng (London)* v 82 Dec 1987 p 1089-1119.

**090124 TEMPORARY WORKS FOR THE PUMP-ING STATIONS AT PLOVER COVE RESERVOIR, HONG KONG.** The Paper describes the design and construction of the three most interesting temporary works schemes at Plover Cove. Two structures were built in the reservoir whose operating level could vary by as much as 18 m during construction. One, the Tai Mei Tuk B pumping station, was cast above water and lowered by an 8500 t capacity jacking system. The other, Harbour Island intake tower, was built in a gravity cofferdam of unusual design capable of providing dry working conditions 29 m below reservoir level. Also described for this Paper is the deep vertical excavation in decomposed sandstone for the Harbor Island pumping station. (Author abstract) 2 refs.

**090125 RUNOFF IMPOUNDMENT FOR SUPPLEMENTAL IRRIGATION IN TEXAS.** Large amounts of runoff occur in the eastern part of Texas that could be collected in small impoundments and utilized for crop production. Farmers in water-surplus basins or subbasins can apply for a permit to divert surface water into small on-farm impoundments to be used for supplemental irrigation. The costs for runoff collection and two supplemental irrigations, which amount to a total of 4 in./yr., are estimated to be approximately \$60/acre/year. Depending upon the crop produced, the estimated increase in gross income from supplemental irrigation ranges from about \$80 to more than \$100 per acre annually. (Author abstract) 15 refs.

Krishna, J.H. (Texas Agricultural Experiment Station, Temple, TX, USA); Arkin, G.F.; Martin, J.R. *Water Resour Bull* v 23 n 6 Dec 1987 p 1057-1061.

**090126 NUTRIENT BUDGET FOR A HYPERTROPHIC RESERVOIR.** A nutrient budget for the shallow, hypertrophic Ardleigh Reservoir, a pumped storage scheme in eastern England, is described for the period 1979-1982. Algal succession in the reservoir was typical of eutrophic waters, with maximum chlorophyll-a of 98 mg m<sup>-3</sup>. Although the reservoir did not stratify thermally, the concentrations of Soluble reactive phosphorus (SRP), Mn and Fe increased in bottom waters during summer. The weight ratio of inorganic N to inorganic P ranged from 720 to 5. On average, SRP represented 72% of the total P content of the reservoir. Some 44% of water input was of pumped river water, 48% being of direct catchment flow. The specific loading of SRP was 5.014 g m<sup>-2</sup> yr<sup>-1</sup>. Strategies of P control are discussed in relation to loading models. (Edited author abstract) 22 refs.

**090127 EINFLUSS DER STANDZEIT IN WASSERBEHAELTERN AUF DIE WASSERQUALITÄT: BERICHT UEBER EIN F + E-VORHABEN.** [Influence of Residence Time in Water Reservoirs with Regard to Water Quality]. For reservoirs with the function of long-term storage of drinking water there are no guide values available up to now about the change of water quality during residence time. In 5 reservoirs with different types of water, wall surface, methods of water treatment and reservoir cleaning 11 long-term storage tests of 17 to 126 days duration were carried out. The result was that storage of 5 to 7 days in reservoirs with cement lining surfaces does not affect the water quality. The bacterial growth-stimulating influence of chlorinated rubber coating and of chemical cleaners was shown. Accompanying laboratory tests proved that measurement of bacterial growth rate allows us to predict the long-term reaction for each water type. (Author abstract) 5 refs. In German.

**090128 AVANTAGES ET INCONVENIENTS DES BASSINS DE STOCKAGE A L'AMONT DES PRISES D'EAU.** [Advantages and Inconveniences of Storage Basins Upstream of Intakes]. Despite some advantages of reservoirs upstream of intakes, such as self-purification and decantation of water, regulation of river beds, homogenization of water, there are certain inconveniences, in particular the development of the algae, the risk of anaerobiosis with the presence of dissolved metals such as iron, and manganese during the periods of stratification. In Servile, Spain an upstream reservoir has been satisfactorily used in recent years during drought periods. A study of this case is presented. In French.

Gonzalez Rull, Juan Antonio (EMASESA, Seville, Spain). *Water Supply* v 5 n 3/4 1987, Uniting the World of Water, Rome, Italy, Nov 3-7 1986 p SS6.10-SS6.12.

## Algae

**090129 PREDICTION OF NUISANCE BLUE-GREEN ALGAL GROWTH IN NORTH CAROLINA WATERS.** A study was made of the possibility of application of the author's recently developed set of empirical models predicting the summer mean biomass of blue-green algae (mm<sup>3</sup> m<sup>-3</sup>), and models predicting the relative biomass of blue-greens in the phytoplankton as tools to help manage North Carolina water resources experiencing nuisance blue-green algal growth. Statistical analysis of data from 34 reservoirs suggested that none of the above models for blue-green algae were applicable to North Carolina reservoirs. The reasons for the lack of fit are not yet clear, but may include effects of non-algal turbidity, hydraulic flushing, and inorganic carbon availability. (Edited author abstract) 50 refs.

Smith, Val H. (Univ of North Carolina, Chapel Hill, NC, USA). *Rep Water Resour Res Inst Univ NC* n 233 May 1987 34p.

**090130 APPLICATION OF PYROLYSIS-GAS CHROMATOGRAPHY-MASS SPECTROMETRY TO THE CHARACTERIZATION OF HUMIC SUBSTANCES RESULTING FROM DECAY OF AQUATIC PLANTS IN SEDIMENTS AND WATERS.** Pyrolysis-GC-MS, elemental analysis and i.r. spectroscopy reveal major differences between humic substances from aquatic plants (algae and aquatic phanerogams) and lagoonal, marine and lacustrine deposits. Algae are enriched in proteins and their pyrolysis yields numerous nitrogenous by-products (alkylpyroles, nitriles and alkylpyridines) along with aromatic compounds which are thought to reflect the decomposition of individual amino-acids (styrene, toluene, phenol and p-cresol). These compounds are less abundant in the pyrolysis products of humic substances from phanerogams with increasing amounts of methoxyphenols, characteristics of lignins. In the deposits of the Kerguelen Islands and of a 'blue lake' in Greenland, the importance of algal populations is emphasized by pyrolysis products corresponding to nitrogenous and carbohydrate derivatives. (Edited

author abstract) 35 refs.

Gadel, F. (Univ de Perpignan, Le Pecoq, Fr); Bruchet, A. *Water Res* v 21 n 10 Oct 1987 p 1195-1206.

**090131 IMPACT OF ROTIFER GRAZING ON POPULATION DYNAMICS OF GREEN MICROALGAE IN HIGH-RATE PONDS.** In high-rate algal ponds, the grazing activity of rotifers such as *Brachionus rubens* or *B. calyciflorus* often leads to a replacement of *Scenedesmus* species by *Microcystis* *pusillum*. In contrast to many other green microalgae including *Scenedesmus*, *Microcystis* *pusillum* with fully developed spines (setae) cannot be eaten by *Brachionus*. Ecological conditions for population shifts between *Scenedesmus* and *Microcystis* are, therefore, interpreted as a response of the rotifers rather than being due to physiological properties of the algae. Another effect of rotifer grazing on the microbial flora of high-rate ponds is the development of large stable flocs consisting of bacteria and microalgae. (Author abstract) 19 refs.

Schlueter, Manfred (Kernforschungsanlage Juelich GmbH, Juelich, West Ger); Groeneweg, Joost; Soeder, Carl J. *Water Res* v 21 n 10 Oct 1987 p 1293-1297.

**090132 EFFECT OF TOXICANTS ON ALGAL SINKING RATES.** A fluorometric technique was used to measure sinking rates of *Scenedesmus acuminatus* following exposure to Cl and Cu. Observed rates became larger in proportion to chemical dosage. The maximum values were 6.4×ambient at 7.5 g m<sup>-3</sup> chlorine and 7.0×ambient at 40 g m<sup>-3</sup> Cu. In comparison, a maximum increase in sinking rate of 5.4×ambient was achieved with 49 g m<sup>-3</sup> alum. Microscopic observations indicated that cell lysis and flocculation resulted from exposure of algal cells to toxicants. (Author abstract) 27 refs.

**090133 COAGULATION AND REMOVAL OF ALGAE, RESULTING FROM WATER STORAGE UPSTREAM OF RAW WATER INTAKES.** Different treatment configurations on both industrial and pilot plant scale have been evaluated in their ability to cope with high algae loads in reservoir water to be treated. The following unit operations were investigated and compared as to their operational performance: sedimentation/filtration, flotation/filtration, preoxidation/direct filtration. Coagulants used were ferric chloride, alum and polyaluminumchloride. Quantitative and qualitative plankton counts were carried out by microscopy. By means of particle counting within the range of 1 to 200 microns, the efficiency of different solid-liquid separation processes was assessed. Preoxidation and/or three-layer bed filtration may be possible process improvements to deal with algae in a more effective way, 3 refs.

Janssens, J.G. (Antwerp Water Works, Antwerp, Belg); Meheus, J. *Water Supply* v 5 n 3/4 1987, Uniting the World of Water, Rome, Italy, Nov 3-7 1986 p SS6.6 - SS6.7.

**090134 ADVANTAGES AND DISADVANTAGES OF WATER STORAGE UPSTREAM OF INTAKES.** Pre-treatment storage reservoirs are constructed for reserve use or to overcome possible pollution. They may have some positive effects on the quality of the water such as, for example, the mixing and homogenizing of the water supply, the self-purification and decanting of suspended solids or, on the other hand, they may provoke the deterioration of qualitative characteristics because of eutrophication phenomena. The Municipal Water and Gas Board of Genoa, manages three aqueducts, one of which is directly fed by a river, whilst the others are fed by two artificial reservoirs. The experience acquired in the management of the two basins, in particular of the Brugnato Reservoir, which presents clear symptoms of eutrophy, and is always carefully checked for this reason, is discussed. Various solutions which tend to check the

growth of algae are described. The best solution is the elimination of the causes which make eutrophication possible.

## Analysis

**090135 DEVELOPMENT OF A SURROGATE PARAMETER TO DETERMINE THE TRIHALOMETHANE FORMATION POTENTIAL OF TWO RESERVOIRS.** Two reservoirs supplying the drinking water to the greater New Haven area were analyzed for various parameters that may influence the formation of trihalomethanes (THMs). Of special interest was the development of a surrogate parameter by which the potential of these waters to form THMs could be accurately predicted. It was found that ultraviolet (UV) absorbance at 254 nanometers is an excellent predictor of the maximum THM formation in these reservoirs. Differences in the nature and quantity of organic matter between reservoirs were noted to cause slight differences in maximum THM formation potential. The low correlation between extinction coefficients and THM formation potential suggests that molecular size and weight of the organic matter is not a primary determinant in the formation of THMs. (Author abstract) 47 refs.

## California

**090136 HYDROGEN ION CONCENTRATION AND ALKALINITY OF RESERVOIR WATER IN THE SIERRA NEVADA, CALIFORNIA, AND CORRELATIONS WITH AIR POLLUTANTS.** Pardee reservoir supplies water for the east San Francisco Bay Area from a large forested drainage basin located in the Sierra Nevada foothills, extending east to the crest of the mountain range. Analyses of weekly data of reservoir discharge water indicate that  $[H^+]$  has been increasing (1954-1985 data) and alkalinity decreasing (1944-1985 data). Hydrogen ion concentration and alkalinity of reservoir water are correlated with  $NO_x$  (and  $SO_2$  to a lesser extent) emissions from the San Francisco Bay Area. Emissions of  $NO_x$  are about four times greater than those of  $SO_2$ . A lag-time of 3 to 4 yr improves the correlations, especially those of  $SO_2$ . Greatest increases in  $[H^+]$  occur in spring when the snowpack is melting. In the 1950s, spring melt had a dilution effect on  $[H^+]$ , but now  $[H^+]$  increases during spring melt. The paper discusses an explanation for the seasonal variations observed. (Edited author abstract) 10 Refs.

## Design

**090137 OPTIMIZATION OF THE PARAMETERS FOR CASCADE STATIONS WITH INTERBASIN COMPENSATING REGULATION.** On the basis of existing mathematical models of choosing reservoir parameters, this paper for the first time suggests the use of nonlinear programming (NLP) model. When the construction sequence of cascade development is determined, NLP will be used under the constrained conditions of reservoir storages, current discharges, installed capacities and annual power energy. With interbasin compensating regulation of some reservoirs and joint operations of some thermal plants in an electric system, by using NLP, it is possible at the same time to optimize the reservoir parameters under the objective function of minimizing the total cost of electric system. The model is capable of handling 1720 independent variables and 8660 linear and nonlinear constrained conditions. A case study of optimization of the cascade development projects on the Lan-

cang River is discussed. (Author abstract) In Chinese. 7 refs.

Shi, Xican (Tsinghua Univ, China); Wang, Hao. *Shuili Xuebao* n 9 1986 p 1-7.

**090138 JOINT RESERVOIR AND AQUEDUCT DESIGN AND OPERATION.** Numerical quadrature methods are used to solve the integral equations for steady-state reservoir-storage density functions. The resulting approximations are used in a variety of problems with particular emphasis on the joint optimization of the design and operation of reservoirs and water delivery systems. Basic examples, to illustrate the use of the methods, expose several interesting economic tradeoffs present in reservoir operation, and factors affecting these tradeoffs are characterized and categorized. More involved examples show the interdependence of target deliveries, delivery capacities, and the probabilistic nature of the water supplies in joint optimization problems. (Edited author abstract) 21 refs.

**090139 SEISMICITY AROUND BRAZILIAN DAM RESERVOIRS.** A mechanism of earthquake generation by reservoir impounding is proposed here with particular application to the Brazilian cases and to areas subject to low confining stress conditions in stable regions. Six artificial lakes are described and the associated earthquake sources are discussed in terms of natural or induced seismicity. Cases reported here have shown an alteration of the original seismic stability in dam sites, after reservoir loading, as observed by the inhabitants or records from Brasilia's seismological station. All cases appear to be related to an increase in pore pressure in permeable rocks or fracture zones which are confined between impermeable rock slabs of more competent rock. (Edited author abstract) 9 refs.

Coelho, P.E.F.P. (Univ of Western Ontario, London, Ont, Can). *Environ Geol Water Sci* v 10 n 3 1987 p 149-158.

**090140 RESERVOIR INDUCED SEISMICITY - A NEW MODEL.** Deficiencies of different existing models on 'Reservoir Induced Seismicity' have been discussed and a new mathematical model, which enhances a better understanding of triggering mechanism in terms of changes in effective stresses, in situ stresses and water level variations, has been discussed in this paper. In the model fractured rock is simulated by a fluid-filled elastic material subject to Mohr-Coulomb failure criterion. The model has been found to be capable of responding effectively to site specific attributes. It can recognize and explain the phenomenon of time lag observed in several actual cases. It is also capable of simulating stabilization of rock-reservoir system after a period of activities that follow the initial stage of filling. One dimensional and two dimensional, isotropic and anisotropic cases have been analyzed and the model predictions have been found to agree qualitatively with the field observations. ## Hydrodynamics

**090141 OUTLINE OF AN EARTH SLOPE IN THE WATERLINE PART OF LARGE CANALS AND RESERVOIRS.** The cross-sectional outline of large unlined earth canals in the waterline zone can be determined by means of a scheme of the interaction of the channel flow with the soil composing the banks. Authors

consider that a freely standing vertical bank forms on the canal bank as a result of the removal of soil particles by water during wave motion into the channel flow. Any method of calculating slope stability should be used for calculating the most dangerous surface of failure of a vertical bank. Using the variational method, authors examined what curves of sliding are most dangerous in the case of a vertical slope composed of homogeneous soil. In solving this problem authors used the two most prevalent methods of assigning the distribution of stresses on the sliding surface according to the assumptions of Terzaghi and Mozhevitinov. The factor of safety against sliding when determining stresses by Terzaghi's model was determined. 6 refs.

## Ion Exchange

**090142 ASUPRA PASTRARIL ECHILIBRULUI IONIC IN INJECTAREA APELOR IN ZACAMINT.** [On the Maintenance of the Ionic Balance in the Reservoir Water Injection]. The paper presents the laboratory simulation, in conditions reproducing the reservoir, of the formation water filtration, which water has lost its carbon dioxide when reaching the surface. This test shows the lowering of the receptivity index. This is a consequence of the strong ionic exchange, which is outlined by the X-ray-structural and chemico-spectral analyses and by the filtrated water characteristics variation. Based upon the laws of the ionic exchange in reservoir conditions, the receptivity of the petroliferous collectors can only be maintained if the ionic balance of the original conditions is preserved at reservoir opening. (Author abstract) In Romanian. 26 refs.

## Japan

**090143 AVANTAGES ET INCONVENIENTS DU STORAGE EN AMONT DE PRISES D'EAU.** [Advantages and Disadvantages of Water Storage Upstream of Intakes]. The Tokyo upstream water storage system is described and their advantages and disadvantages are noted. In Japan, the construction of storage reservoirs is inevitable in order to develop new water resources. The greatest advantage of constructing them upstream of intakes is that it is possible to increase available water quantity by regulating the river flow. However, the storage reservoirs cause many problems such as deterioration of water quality unless they are well-managed. Especially, it is necessary to pay attention to eutrophication of the reservoirs. The construction of storage reservoirs greatly influences the living of dwellers or the nearby natural environment. Japan is a mountainous country and has many steep sided rivers. Much mud and sand may flow into the storage reservoirs unless sufficient measures are taken against washout of the surface of the mountains. Actually, several of the storage reservoirs in Japan are suffering from the accumulation of mud and sand. In English, French.

## Leak Detection

**090144 GROUTING AND DRAINAGE OF THE PATEA DIVERSION TUNNELS.** The reservoir for the Patea Hydro-Electric Scheme is in part contained by a natural ridge of Tertiary sandstones. During construction of the scheme, the river was diverted beneath this ridge through twin concrete lined diversion tunnels. The tunnels were subsequently plugged, and the contact between the tunnel lining and parent rock was grouted with both curtain and contact grouting. Drains were provided to

reduce the ground water pressures surrounding the tunnels downstream of the plugs. Some time after reservoir filling, a flow of lake water developed into one of the tunnels through the relief drains. This paper describes the search work involved in determining the flow path, the techniques used in grouting, and the design philosophy adopted in the drainage installation. (Edited author abstract).

## Management

**090145 COMPARISON OF RESERVOIR LINEAR OPERATION RULES USING LINEAR AND DYNAMIC PROGRAMMING.** Optimal monthly release policies are derived for Hoover Reservoir, located in Central Ohio, using chance-constrained linear programming and dynamic programming-regression methodologies. Important characteristics of the former approach are derived, discussed, and graphically illustrated using Hoover Reservoir as a case example. Results indicate that, for the mean detention time and the corresponding safe yield target water supply release under existing design of Hoover Reservoir, the dynamic programming policies produce lower average annual losses while achieving at least as high reliability levels when compared to policies derived under the chance-constrained linear programming method. (Edited author abstract) 10 refs.

Bhaskar, Nageshwar Rao (Univ of Louisville, Louisville, KY, USA); Whittlatch, E. Earl. *Water Resour Bull* v 23 n 6 Dec 1987 p 1027-1036.

**090146 MANAGEMENT OF A CASCADE OF RESERVOIRS UNDER SURPLUS INFLOW CONDITIONS.** The problem of managing the operating regimes of cascades of reservoirs is investigated. Functioning of the cascade is subject to a set of requirements - sanitary, transport, municipal, fishery, power, irrigation, etc. As usual, the problem is raised of satisfying these requirements given in the form of inequalities for the largest possible number of years in the investigated time interval. The solution of this main problem (problem 1) was given previously in a class of dispatcher's rules of management by means of an algorithm for finding so-called lower critical volumes, which single out zones of firm releases in the set of states of the cascade. In the previous solution nonreturnable withdrawals for irrigation were assigned in the form of fixed, although time-dependent, quantities, which made it possible to regard them as a component (as a rule, with a 'minus' sign) of the local inflow. A new problem is examined in this paper, which is aimed at finding the rules of withdrawal. 3 refs.

**090147 LA MODELISATION DE LA SEDIMENTATION ET SON IMPORTANCE EN GESTION DE RESERVOIRS.** [Sedimentation Modeling and Its Importance for Reservoir Management]. A hydropower system is often managed to achieve maximum performance. In a watershed where the silting phenomena are significant, this type of operation may cause a high rate of reservoir silting. This paper describes a mathematical model which uses a transport equation of the solid phase (suspension and bed load) to study the progressive silting of two reservoirs Daesti and Rm. Vilcea on the Olt river cascade development in Rumania. Various regimes of operation were simulated as well as their influence on reducing silting during the flood. (Edited author abstract) 9 refs. In French.

## Mathematical Models

**090149 DIFFUSION THEORY FOR STOCHASTIC STORAGE ANALYSIS.** In this study, a new analytical method based on the theory of continuous Markov diffusion processes is presented for approximating the equilibrium cumulative distribution function of storage in a finite reservoir. Storage can reside on the reservoir boundaries or at any level between these barriers. The storage distribution function, then, is expected to have discrete mass concentrations on both boundaries and a continuous probability density between the reservoir boundaries. Accordingly, the proposed method of analysis entails a two part procedure. The first step finds the equilibrium form of the continuous storage density function between the reservoir barriers while the second step evaluates the boundary mass concentrations corresponding to the equilibrium probability that the reservoir is empty or full. The analytic procedure is developed on the premise that away from the boundaries of a finite reservoir, the time evolution of the storage probability density function behaves as a one-dimensional diffusion process and therefore may be described with the Fokker-Planck equation. 143 refs.

## Optimization

**090150 IMPROVED ALGORITHMS FOR RESERVOIR CAPACITY CALCULATION INCORPORATING STORAGE-DEPENDENT LOSSES AND RELIABILITY NORM.** Two algorithms that improve upon the sequent-peak procedure for reservoir capacity calculation are presented. The first incorporates storage-dependent losses (like evaporation losses) exactly as the standard linear programming formulation does. The second extends the first so as to enable designing with less than maximum reliability even when allowable shortfall in any failure year is also specified. Together, the algorithms provide a more accurate, flexible and yet fast method of calculating the storage capacity requirement in preliminary screening and optimization models. (Author abstract) 7 refs.

Lele, Sharad M. (Indian Inst of Science, Bangalore, India). *Water Resour Res* v 23 n 10 Oct 1987 p 1819-1823.

**090151 MODELLING AND OPTIMIZATION OF PARALLEL RESERVOIRS HAVING NONLINEAR STORAGE CURVES UNDER CRITICAL WATER CONDITIONS FOR LONG-TERM REGULATION.** This paper deals with the problem of parallel reservoirs having nonlinear storage-elevation curves (quadratic functions) for long-term regulation under critical water conditions using the minimum norm formulation. To overcome these nonlinearities, we introduce a set of pseudo-state variables. A set of optimizing equations is obtained. The proposed method is efficient in computing time and in calculating the expected benefits of generation from the system during the critical period. Numerical results are reported for a real system in operation consisting of two rivers; each river has two reservoirs in series. The results are relevant to multireservoir hydroelectric power systems. (Edited author abstract) 9 refs.

Christensen, G.S. (Univ of Alberta, Edmonton, Alberta, Can); Soliman, S.A. *J Optim Theory Appl* v 55 n 3 Dec 1987 p 359-376.

**090152 IMPLICIT STOCHASTIC MODEL FOR RESERVOIR YIELD OPTIMIZATION.** The implicit stochastic model is aimed at solving the specific problem of the optimal reservoir yield when the demand is not known. A three-level algorithm is proposed for the reservoir yield computation. At the first level, the simulation is used for computing the value of objective function. At the second level, computation of the seasonal reservoir operating rules is presented. The approach used for deriving the reservoir operating rules is based on the nonlinear unconstrained multivariable search of M.J.D. Powell. The third level is used for estimating the single multipurpose reservoir yield. The Fibonacci search procedure is used for the optimization of the reservoir at this level. The model is used in reservoir analysis for the water resources master plan of the Republic of Serbia, Yugoslavia. In this case, 49 reservoirs were analyzed. (Edited author abstract) 20 refs.

Simonovic, Slobodan (Univ of Manitoba, Winnipeg, Manit, Can). *Water Resour Res* v 23 n 12 Dec 1987 p 2159-2165.

**090153 DERIVING THE NONLINEAR RISK-BENEFIT ALGORITHM FOR RESERVOIRS.** The Nonlinear Risk-Benefit (NRB) Algorithm includes risk as one of the objectives in a multiple-objective optimization problem. The NRB Algorithm is derived by extending the Surrogate Worth Trade-Off method to quadratic programming. This category of problem is common in water resources planning and design, especially multipurpose reservoir systems. Consequently, an example is given using the algorithm for optimally operating a multipurpose reservoir. (Author abstract) 31 refs.

## Planning See Also FLOOD CONTROL—USSR.

**090154 WROCLAW KORYNEKI TARZOK ES ELLENORZO VIZSGALATAIK.** [Reservoirs Around Wroclaw and Their Supervision]. The characteristics in the construction, usage and operation of dams located in south-west Poland are similar to those available in Hungary. Therefore, their planning, construction and the structural checks are comparable to each other, in the two countries. The authors deal in this paper with the geological, hydrological and constructional problems of the dams of Mietkow and of Dobromierz. These earth-dams fulfill multiobjective tasks such as, water supply, flood protection, industrial water production, navigation, recreation and sports. The methods of observation and measurement are quite similar in the two countries and the Polish instrument-industry is well-prepared to produce modern tools for different technical purposes. (Edited author abstract) 6 refs. In Hungarian.

Gresz, Istvan (Vizgazdalkodasi Tudomanyos Kutatkozpont, Budapest, Hung); Nagy, Istvan Miklos. *Vizugyi Kozl* v 69 n 2 1987 p 264-273.

**090155 PREDICTION OF WATER QUALITY IN PLANNED RESERVOIRS IN THE TROPICAL ZONE.** The hydrochemical regime of reservoirs during the first months after their filling is formed under the effect of a number of factors, the main one being the effect of the flooded soils of the reservoir bed and vegetation. The flooded soils and rocks and the remains of trees, shrubs, and meadow vegetation release into the water diverse organic and biogenic materials influencing the hydrochemical and oxygen regimes of reservoirs and their sanitary state. A prediction of water quality in a planned reservoir makes it possible to estimate possible concentrations of pollutants and their dynamics in the first months and years of existence of the reservoir and the volume of necessary works on clearing and preparing the bed of the future reservoir. By using appropriate transformation coefficients and the appropriate method of predicting water quality in planned reservoirs it is possible to predict with greater reliability the changes in the water quality

during the first months and years of existence of practically all reservoirs of Southwestern Asia which will be created in regions of ferrallitic and ferrallitic-margallitic soils with vegetation characteristic for the tropical zone. 6 refs.

**090156 TEMPERATURE ANALYSIS HOWARD A. HANSON RESERVOIR, WASHINGTON; MATHEMATICAL MODEL INVESTIGATION.** The US Army Engineer District, Seattle, is presently evaluating the impacts of proposed additional water storage at Howard A. Hanson Reservoir in Washington State. The impacts of raising the conservation pool on the reservoir thermal profiles and release temperatures for several study years are investigated. A mathematical model examined impacts of raising the pool with and without structural modification to the existing outlet works. Optimization procedures were used to provide optimum number of and elevations for the additional ports. Significant improvement in release temperatures for the raised pool could be achieved with a multilevel outlet structure as compared to the existing outlet works. The method for calculating the reliability index is given in Appendix A. Appendix B lists monthly temperature release statistics for existing conditions, and Appendix C lists the calculated average release temperature for the reservoir. (Edited author abstract). 12 Refs.

## Recreational Facilities

**090157 RECREATION RESOURCE ALLOCATION MODEL FOR PUBLIC DRINKING RESERVOIRS.** A management model was developed for determining optimal mixes of recreation activities at public drinking reservoirs. Quabbin Reservoir, located in Central Massachusetts, served as a case study for the Model. An interdisciplinary research team was formed to study (1) the impact of selected recreation activities on the water quality, (2) public demand and willingness to pay for selected recreation activities at Quabbin and (3) the cost-benefits associated with increases in recreation at Quabbin. The results of the research yielded a comprehensive Recreation Resource Allocation Model. The model includes the following procedures: the determination of demand for recreation activity packages, pollution transport modelling and water quality carrying capacity and recreation carrying capacity. These inputs to the optimization of the recreation management model were utilized in formulating alternative plans which were tested for their impacts given the management objectives and constraints of the study. (Author abstract) 9 refs.

## Reliability

**090158 RELIABILITY EVALUATION OF RESERVOIR SYSTEMS.** Systems with reservoirs or storages are a particular case of what is called failure delay systems, for which, contrarily to the classical reliability systems, failure occurs under two conditions: the occurrence of a particular failure, i.e. a cut set, and moreover its continuous presence for a given time (random or fixed). This paper deals with reliability modeling of water reservoir systems. The three models developed and the corresponding REX software package are presented, which use for reliability evaluation and optimization of such systems is illustrated by several numerical examples. (Author abstract). 6 Refs.

## Safety Codes

**090159 RESERVOIR SAFETY PROGRAMME IN NORTHERN IRELAND.** Following publication of early proposals for the Reservoirs Act 1975, a systematic program of reservoir investigation and repair work was carried out by the Department of the Environment for Northern Ireland, Water Service. The paper describes the full procedure followed for data collection, inspections, risk classification and stability and hydraulic investigations of 60 'large raised reservoirs' impounded by dams up to 42 m high and up to 148 years old. Also described are examples of some unusual repair works carried out, and the implementation of a recording, monitoring, and inspection system which now continually oversees all of the reservoirs involved. (Author abstract) 6 refs.

Cooper, G.A. (Ferguson & McIlveen). *J Inst Water Environ Manage* v 1 n 1 Aug 1987 p 39-51.

**090160 RESERVOIR SAFETY.** Water impounded in a reservoir has considerable potential to cause damage, destruction and even death. For this reason, periodic reviews of reservoir structures have been required by law for over fifty years. The recently implemented 1975 Reservoirs Act imposes more stringent regulations than ever before, and the Department of the Environment has been sponsoring research to support the new legislation. Some of the work is being conducted by Hydraulics Research, who recently held a seminar to examine some of their findings, and discuss the latest legislation. (Author abstract)

## Sampling

**090161 PHOSPHATE EXCHANGE CHARACTERISTICS OF WET AND DRIED SEDIMENT SAMPLES FROM A HYPERTROPHIC RESERVOIR: IMPLICATIONS FOR THE MEASUREMENTS OF SEDIMENT PHOSPHORUS STATUS.** This paper examines changes in the phosphate exchange characteristics induced in sediment samples by drying during preparation for analysis. Comparison of selected sediment parameters measured in wet and dried subsamples of a range of sediments from hypertrophic Hartbeespoort Dam showed that air drying resulted in major changes in their physical and chemical composition. Particle size distribution in the dried sediments showed a shift towards larger particles, particularly in samples in which smaller particles were abundant, indicative of irreversible aggregation of finer particles. Drying decreased the bioavailable phosphorus (NTA-extractable) content of sediments but reduced the phosphate buffering capacity and increased the phosphate equilibrium concentrations by a factor of 3, thereby increasing the phosphate release potential of dried sediments. (Edited author abstract) 19 refs.

**Underground** See Also OIL FUEL—Storage.

**090165 DEEP WASTEWATER RESERVOIRS IN ISRAEL - I: LIMNOLOGICAL CHANGES FOLLOWING SELF-PURIFICATION.** Ma'ale Kishon, one of the largest reservoirs storing wastewater for irrigation in Israel, has a surface area of 1.3 km<sup>2</sup>, depth of 9 m and volume of 12 million m<sup>3</sup>. Secondary effluent enters the northern basin and after a mean retention period of 6 weeks, flows into the southern one. Due to this two-basin structure, changes taking place during the water storage can be detected. The differences between the two basins were quantitatively studied by an interdisciplinary team. The sanitary, physico-chemical and biological variables indicated an improvement in water quality, leading to an increased ecosystem stability and a safer environmental performance. These results suggest that deep reservoirs of the type here described serving for wastewater disposal and reuse may have a wide application also in other countries having warm, subtropical climates. **090166 NEW COMPOSITE MATERIALS FOR HIGH-CAPACITY RESISTORS.** Principal types of high-capacity composite-type resistors, such as the beted (electrically conductive concrete), LKS (linear ceramic), tyrite, Morganite, etc., are considered. Relying on these investigations, it is concluded that it is necessary to use new resistive composite materials (RCM) based on sodium silicate and high-temperature rubber binders for

high-capacity resistors operating under the conditions of short-time or long-time inclusion. (Translated author abstract) In Russian. 6 refs.

**090167 NETWORK RESISTOR ALLOWS MORE CHIPS IN ELECTRONIC UNITS.** The network resistor that enables multiple resistance elements to be installed at one time implements cost savings, reduction in the resistor-occupied area on PCBs and efficient operation of installing equipment; thereby more chips can be installed in the electronic unit. As a surface installing part the network resistor comes as a chip resistor, flat package (SOP type) resistor, chip carrier resistor and micro-network chip. (Edited author abstract)

**090168 STUDY ON NON-REACTIVE REFERENCE RESISTOR (RRU) FOR  $F_r$ -METER.** The impedance-frequency characteristics of a VHF quartz-crystal unit can be accurately explained according to an equivalent circuit containing the fifth parameter ( $R_5$ ). In this paper, it is described that a new RRU (Reference Resistor for everyday Use) is developed by making use of non-reactive resonance frequency ( $f_r$ ) calculated from the equivalent circuit mentioned above for the initial calibration of an  $F_r$ -meter's fixture. The non-reactive frequency ( $f_r$ ) measured by an  $F_r$ -meter's fixture, which has been already calibrated by the new RRU, are compared with the values measured by the Drop Method system in the range of 10-125 MHz. The compared results are very agreed, therefore it is found that the RRU mentioned in this paper is better than the conventional RRU. (Author abstract) 4 refs.

## Contacts

**090169 EFFECT OF SHEET RESISTANCE MODIFICATIONS UNDERNEATH THE CONTACT ON THE EXTRACTION OF THE CONTACT RESISTIVITY: APPLICATION TO THE CROSS KELVIN RESISTOR.** The influence of sheet-resistance modifications underneath the contact on the extraction of the contact resistivity is investigated. A generalized scaling theory has been applied to the modeling of the cross Kelvin resistor. It is shown that the errors associated with the contact sheet resistance modification could become appreciable in low-resistance metallizations of interest in VLSI. 10 refs.

## Design

**090170 NEW CMOS RESISTOR IMPLEMENTATION FOR LINEAR IC APPLICATIONS.** A new CMOS implementation for a linearized floating resistance is presented, where the resistor value depends only on the  $\beta$  of a matched set of nMOS transistors, and on a bias current  $I_B$ ; it is independent of the threshold voltage  $V_T$ . Simulated worst-case linearity for a unity-gain amplifier is around 1% for a  $\pm 2$  v output swing. (Author abstract) 5 refs.

**090172 ELECTROCHEMICAL ADJUSTMENT OF THIN FILM Ti-Pd RESISTORS.** In this study a plating technique is described which allows adjustment of Ti-Pd resistors and minimizes changes in design geometry, characteristics. The approach is advantageous in that it provides a method for either increasing or decreasing the resistor value. This plating-deplating process uses a pencil-like electrochemical cell which immobilizes or restricts the plating electrolyte to the area immediately over the resistor without need for a mask; it is similar in nature to anodic trimming. A lower resistance is obtained by plating a thin layer of gold onto the resistor. The removal of the palladium (or deplating) yields a higher value resistor. The approach permits more uniform sheet resistivity changes and minimizes the impedance discontinuities seen in strip-line resistors adjusted by other conventional methods of adjustment. 7 refs.

**090173 DISORDER-INDUCED NONLINEAR CONDUCTIVITY.** We consider an electrical network of resistors in two dimensions. Each resistor has a threshold value for the potential drop below which it becomes an insulator. If the thresholds are randomly distributed, the current flowing through the total network is not proportional to the external voltage. A new nonlinear relation between current and voltage appears. ## Electric Properties

**090174 FREQUENCY DEPENDENCE OF RESISTIVE COMPONENT OF IMPEDANCE OF SILICON THIN-FILM RESISTORS.** A high-value resistor based on silicon thin film is described whose noise and frequency characteristics considerably surpass those of manufactured resistors. The frequency dependence of the resistive component of impedance is studied to determine the noise and frequency characteristics of the silicon thin-film resistors. The results permit calculation of the energy equivalent of the noise of resistors in nuclear-radiation detection units at any temperature from their frequency characteristic at room temperature. (Author abstract) 7 refs.

**090176 ELECTRICAL PROPERTIES OF CONDUCTIVE MATERIALS USED IN THICK-FILM RESISTORS.** Layers of conductive oxide powders ( $\text{IrO}_2$ ,  $\text{RuO}_2$  and  $\text{Bi}_2\text{Ru}_2\text{O}_7$ ) were prepared on alumina substrates by a thick film technique. The films were fired at 875°C for different dwell times. The temperature dependence of resistance was measured in the range -196 to 850°C. SEM observations of the initial powders and the resistive layer surface after firing, as well as X-ray diffraction investigations, were carried out. The  $\text{RuO}_2$  and  $\text{IrO}_2$  oxides exhibit a high sintering ratio and the resistance of the fired layers increases with temperature as in the single crystal. The R(T) curve for  $\text{Bi}_2\text{Ru}_2\text{O}_7$  layers is in qualitative agreement with the polycrystalline material. The role of the grain surface area and the regions between the grains is dominant. (Author abstract). 23 Refs.

## Fabrication

**090177 NOVEL SCALED-DOWN OXYGEN-IMPLANTED POLYSILICON RESISTOR FOR FUTURE STATIC RAM'S.** A scaled-down high resistor (1  $\mu\text{m}$  or less in length) for future static RAMs was realized by using slow arsenic diffusion in oxygen-implanted polysilicon, by which arsenic is partially doped to form a polysilicon interconnection layer. The current-voltage characteristics of the oxygen-doped polysilicon resistors were almost linear, and the marked decrease in resistance for higher applied voltage, observed in undoped polysilicon, was not found. The field-effect modulation of the resistance in the oxygen-doped polysilicon was much less than that of an undoped one. 5 refs.

## Failure

**090178 TRANSIENT THERMAL FAILURE MODE IN METAL FILM RESISTORS.** A failure mode has been observed in metal film resistors when they are subjected to single shot high voltage pulses. The conductor fails at a high field point which may be inherent in the design or may be due to manufacturing defects. The localized nature of the failure leads to the conclusion that there is a closed loop mechanism: the decrease in thermal diffusivity of the structure with rising temperature leads to an increase in the rate of temperature rise. (Author abstract) 6 refs.

**090180** MASSENPRODUKTION VON AXIALEN DÜNNSCHICHT-WIDERSTÄNDEN FÜR ALLGEMEINE ANWENDUNGEN VON 0,1 OHM BIS 10 GIGAOHM. [Mass Production of General-Purpose Axial-Lead Thin Film Resistors from 0.1 to 10 Gigaohms]. A coater of high productivity is described allowing random coating at a high confidence level by means of magnetron sputtering. Based on four different target materials, and on non-reactive as well as partially reactive dc magnetron sputtering, it is possible to cover a range of sheet resistances from 1 Ohm/sq to 25 kOhms/sq; a range which, as a rule, embraces more than 98% of the total resistor assortment. By introducing another RF-sputterable resistor material the resistance range may even be extended to 10 MOhms/sq. (Edited author abstract) In German. 13 refs.

## Microstructure

**090182** INFLUENCE OF PROCESS VARIABLES ON MICROSTRUCTURE AND V-I CHARACTERISTICS OF MULTICOMPONENT ZnO-BASED NONLINEAR RESISTORS. Studies have been made of the process variables such as calcination, initial particle size, and postsintering on density, microstructure, V-I characteristics, and energy-handling capability of a ZnO-based composite: 87.325 wt% ZnO+0.1% Nb<sub>2</sub>O<sub>5</sub>+3.5% Sb<sub>2</sub>O<sub>3</sub>+6% Bi<sub>2</sub>O<sub>3</sub>+0.55% CoO+0.7% MnO<sub>2</sub>+0.9% Cr<sub>2</sub>O<sub>3</sub>+0.9% NiO+0.025% Al(NO<sub>3</sub>)<sub>3</sub>. The nonlinear characteristics were found to be improved by the calcination of a ZnO+Nb<sub>2</sub>O<sub>5</sub> mixture at 1200°C for 1 h. The postsintering heat treatment was found to rejuvenate V-I characteristics of the degraded sample to a greater extent. (Edited author abstract) 24 refs.

## Performance

**090183** OVERVIEW OF HIGH VOLTAGE RESISTOR CHARACTERISTICS. High voltage resistors find use in a wide range of applications similar to low voltage applications: they control or limit current, drop or divide voltage, and form loads. However, high voltage applications add a new set of problems because resistor characteristics that are insignificant at low voltages assume a greater significance at high voltages. Important high voltage resistor characteristics are considered, such as absolute tolerance, temperature coefficient, voltage coefficient, load life stability, ratio tolerance, ratio temperature coefficient, and ratio voltage coefficient.

## Thermal Effects

**090185** TEMPERATURE DEPENDENCE OF ELECTRICAL CONDUCTION IN CARBON-EPOXY RESIN RESISTORS. It is well known that the carbon black (CB) - polymer resin resistor is advantageous because of its cheap manufacturing cost. However, there are also disadvantages such as: large temperature coefficient of resistance (TCR), and large humidity dependence of resistance. This paper attempts to clarify the mechanism of electrical conduction, especially its temperature dependence, experimentally and theoretically to obtain more information about producing low TCR resistors. Temperature dependence of resistivity for the mixture made of CB and epoxy resin can be explained well with a deliberately modified conduction mechanism based upon Scarisbrick's model, incorporating the thermal expansion of resin and the thermally activated conduction process in the model. (Edited author abstract) 16 refs.

## Thermal Properties

**090186** DVM/DMM APPLICATIONS: SIMPLIFIED RESISTOR TEMPERATURE COEFFICIENT TEST SYSTEM. The temperature coefficient (TC) of a resistor is an important consideration to equipment design engineers. With current technology, evaluation of resistors can be accomplished by using an accurate 6½-digit digital multimeter (DMM). The DMM must be designed to make four-terminal resistance measurements and compensate for thermal EMF error voltages (offset compensation).
